Hideki Takaishi Article Collection

2022

English Edition

388 articles

Complete English translations of the revised Ameblo articles

In chronological order of the original Ameblo publication date

Confirmed errors in wording, legal descriptions, and translations have been corrected. Unless otherwise stated, descriptions of legal rules, outlooks, and statistics reflect the time when each original article was published.

Article Index

01 2022-01-04 Tokyo District Court, 2010 (Wa) 26341, Oil-Based Liquid Cleansing Composition <Osuga>

02 2022-01-04 United States, June 2004, CAFC, Honeywell v. Hamilton

03 2022-01-04 UK Supreme Court, [2017] UKSC 48; German Federal Court of Justice, X ZR 29/15; Actavis v. Eli Lilly

04 2022-01-04 United States, March 2002, CAFC en banc, Johnson & Johnston v. R.E. Service

05 2022-01-04 United States, November 2006, CAFC, DePuy Spine v. Medtronic

06 2022-01-04 United States, March 2009, CAFC, Crown Packaging v. Rexam

07 2022-01-04 United States, May 2017, CAFC, Mylan v. Aurobindo Pharma

08 2022-01-05 May 2017, U.S. Supreme Court, TC Heartland [Venue in Patent Infringement Litigation]

09 2022-01-06 May 2017, U.S. Supreme Court, Water Splash v. Menon

10 2022-01-07 IP High Court, 2020 (Gyo-Ke) 10044, Lipid-Containing Composition <Otaka>

11 2022-01-07 The third edition of Patent Case Law Encyclopedia by Issue was published today. (Keizai Sangyo Chosakai)

12 2022-01-08 IP High Court, 2020 (Gyo-Ke) 10132, Therapeutic Agent for Osteoporosis <Kanno>

13 2022-01-08 IP High Court, 2020 (Gyo-Ke) 10106, Reading Device <Mori>

14 2022-01-08 IP High Court, 2020 (Gyo-Ke) 10115, Beauty Device <Kanno>

15 2022-01-11 IP High Court, 2020 (Gyo-Ke) 10134, System for … Controlling Digital Art Distribution and Viewing … <Mori>

16 2022-01-12 Osaka District Court, 2019 (Wa) 5444, Carbon Dioxide-Containing Viscous Composition — Liability of the Defendant Director under Companies Act Article 429(1) Affirmed

17 2022-01-13 Osaka District Court, 2020 (Wa) 3247, Device for Detecting Water-Leak Locations in Water Supply Piping <Sugiura>

18 2022-01-14 Osaka District Court, 2017 (Wa) 10716, Handrail Mounting Device <Sugiura>

19 2022-01-17 Osaka District Court, 2018 (Wa) 6015 <Sugiura>

20 2022-01-17 IP High Court, 2014 (Ne) 10109, Transdermal Preparation, Transdermal Preparation Holding Sheet … <Otaka>

21 2022-01-17 IP High Court, 2020 (Ne) 10045, Dot Pattern <Kanno>

22 2022-01-18 IP High Court, 2013 (Gyo-Ke) 10346, Method for Manufacturing a Crystal Oscillator <Ishii>

23 2022-01-19 IP High Court, 2016 (Gyo-Ke) 10257, Portable Information Communication Device <Mori>

24 2022-01-20 IP High Court, 2020 (Gyo-Ke) 10027, Sensor Assembly for Body Fluids <Mori>

25 2022-01-21 Tokyo District Court, 2019 (Wa) 30991, Composition Containing … or 2,3,3,3-Tetrafluoropropene <Tanaka>

26 2022-01-24 [Gas Dissolution Apparatus] Can a Person Skilled in the Art Recognize that the Problem Can Be Solved When 0.8 < L < 1.4?

27 2022-01-24 Osaka District Court, 2015 (Wa) 5869, Scour Prevention Material for Underwater Structures <Morisaki>

28 2022-01-24 IP High Court, 2020 (Gyo-Ke) 10147, Game Program <Mori>

29 2022-01-25 IP High Court, 2019 (Gyo-Ke) 10159, X-Ray Fluoroscopy Imaging Apparatus <Kanno>

30 2022-01-26 Tokyo District Court, 2011 (Wa) 27781, Touch-Screen Display …, Interlocutory Judgment <Osuga>

31 2022-01-27 IP High Court, 2020 (Gyo-Ke) 10030, Drain Plug Device <Otaka>

32 2022-01-28 Osaka District Court, 2007 (Wa) 2076, Combination Weighing Apparatus

33 2022-01-31 IP High Court, 2020 (Gyo-Ke) 10037, Gaming Machine <Otaka>

34 2022-02-01 Tokyo District Court, 2019 (Wa) 31214, Vinylidene Chloride Resin Wrapping Film <Tanaka>

35 2022-02-03 [U.S. Designs] September 2019, CAFC, Curver Luxembourg v. Home Expressions

36 2022-02-03 [U.S. Designs] October 2021, CAFC, In re SurgiSil, L.L.P.

37 2022-02-03 June 2014, U.S. Supreme Court, Nautilus v. Biosig

38 2022-02-03 October 2019, CAFC, HZNP v. Actavis

39 2022-02-03 August 2021, CAFC, Eli Lilly v. Teva

40 2022-02-03 I Have Uploaded an Article Introducing the LINE Furufuru (“Shake It”) Lawsuit to the Firm’s Website. Tokyo District Court, 2017 (Wa) 36506 <Sato>

41 2022-02-04 IP High Court, 2008 (Ne) 10061, Refrigeration System and Condensing Heat Exchanger <Nakano> — Jurisdiction over Patent Cases

42 2022-02-05 IP High Court, 2020 (Gyo-Ke) 10075, Package <Mori>

43 2022-02-07 [Trademarks] Osaka District Court, 2018 (Wa) 11672, “Re Shukatsu” and “Rishu Katsu”

44 2022-02-08 Tokyo District Court, 2019 (Wa) 2034 <Sato> — Breach of the Non-Compete Obligation in a Business Transfer Agreement ⇒ Injunction

45 2022-02-09 [Request for Disclosure of Sender Information] Osaka District Court, 2020 (Wa) 1995

46 2022-02-10 [Unfair Competition Prevention Act] IP High Court, 2019 (Ne) 10008 — Advertisements Such as “100% Survival Rate” Were Held to Be Quality-Misrepresenting Indications!!

47 2022-02-12 IP High Court, 2020 (Gyo-Ke) 10103, Multicolor Penlight <Shoji>

48 2022-02-12 IP High Court, 2020 (Gyo-Ke) 10011, Catheter Assembly <Otaka>

49 2022-02-14 IP High Court, 2020 (Ne) 10025, Light-Emitting Device and Other Inventions <Mori>

50 2022-02-14 Tokyo District Court, 2012 (Wa) 14227, Method for Manufacturing a p-Type Gallium Nitride Compound Semiconductor <Takano>

51 2022-02-15 Osaka District Court, 2016 (Wa) 2688, Coated Copper Wire for Ball Bonding

52 2022-02-16 Osaka District Court, 2006 (Wa) 6162, Lead-Free Solder Alloy <Yamada>

53 2022-02-17 Tokyo District Court, 2013 (Wa) 3360, Ferromagnetic Sputtering Target with Dispersed Nonmagnetic Material Particles <Hasegawa>

54 2022-02-18 Tokyo District Court, 2017 (Wa) 44053, Combination Therapy for … B-Cell Lymphoma <Yamada>

55 2022-02-21 [Article] “The Actual-Material Approach under the Plant Variety Protection and Seed Act,” Judges Kazuhide Shimasue and Yasuo Nishimura

56 2022-02-21 [Article] “Transfer of Articles Used to Work a Patented Invention and Whether Exhaustion Arises,” Professor Yasuyuki Echi

57 2022-02-21 I Was Ranked in Band 4 by Chambers.

58 2022-02-22 IP High Court, 2013 (Ne) 10026, Apparatus for Mixing Powder and Granular Material and Removing Fine Powder <Iimura>

59 2022-02-22 United States, 2009, CAFC en banc, Cardiac v. St. Jude Medical

60 2022-02-24 United States, April 2007, Supreme Court, Microsoft v. AT&T

61 2022-02-25 United States, July 2004, CAFC, Pellegrini v. Analog Devices

62 2022-02-28 United States, June 2000, CAFC, Rotec v. Mitsubishi

63 2022-02-28 United States, April 2001, CAFC, Waymark v. Porta Systems

64 2022-02-28 United States, June 2018, Supreme Court, WesternGeco v. ION Geophysical

65 2022-02-28 February 27, 2022 — I Took the 160th Unified Grade 2 Bookkeeping Examination (Paper-Based).

66 2022-03-01 United States, June 2008, Supreme Court, Quanta v. LG Electronics

67 2022-03-02 United States, May 2017, Supreme Court, IMPRESSION PRODUCTS v. LEXMARK

68 2022-03-03 United States, 1961, Supreme Court, ARO <Exhaustion>

69 2022-03-04 May 2002, CAFC, Husky v. R&D Tool & Engineering

70 2022-03-05 May 2011, U.S. Supreme Court, Global-Tech v. SEB

71 2022-03-05 May 2015, U.S. Supreme Court, Commil v. Cisco

72 2022-03-07 2005, CAFC, NTP v. Research in Motion (BlackBerry Case)

73 2022-03-08 June 2014, U.S. Supreme Court; August 2015, CAFC, LIMELIGHT v. AKAMAI

74 2022-03-09 Narrowing Amendments During Prosecution and the Doctrine of Equivalents: Global Case-Law Trends and Japanese Cases

75 2022-03-10 “Infringement of a U.S. Patent by Importing into the United States … Products Made by a Process Covered by That Patent” (Takayuki Yahagi)

76 2022-03-11 IP High Court, 2020 (Gyo-Ke) 10124, Method for Manufacturing … Ink Composition <Shoji> — *Not an Issue of “Obviousness upon Obviousness”

77 2022-03-12 — Tokyo District Court, 2016 (Wa) 25436, Method for Producing L-Glutamic Acid <Presiding Judge Yamada> —

78 2022-03-14 ★ Decisions affirming and denying directors' liability under Article 429(1) of the Companies Act in intellectual property litigation

79 2022-03-15 European Patent Practice (1) <Procedure> (From the lecture transcript of German patent attorney Kan Hasegawa)

80 2022-03-16 European Patent Practice (2) <Claim Drafting> (From the lecture transcript of German patent attorney Kan Hasegawa)

81 2022-03-17 "Amendment to narrow scope of claim in process of prosecution and application of doctrine of equivalents (international trend in court cases and overview of Japanese court cases)"

82 2022-03-18 European Patent Practice (3) <Amendments> (From the lecture transcript of German patent attorney Kan Hasegawa)

83 2022-03-18 I successfully passed the 160th Unified Grade 2 Bookkeeping Examination (paper-based, February 27, 2022). (78 points)

84 2022-03-22 European Patent Practice (4) <Pitfalls in Novelty> (From the lecture transcript of German patent attorney Kan Hasegawa)

85 2022-03-22 <Narrowing Amendments During Prosecution and the Doctrine of Equivalents>

86 2022-03-22 IP High Court, 2019 (Gyo-Ke) 10046 <Otaka> [Circuit Breaker Mounting Structure] (1) Inventive step: yes; (2) Divisional application requirements: satisfied

87 2022-03-23 IP High Court, 2020 (Gyo-Ke) 10103 [Multicolor Penlight] <Shoji>

88 2022-03-24 Tokyo District Court, 2018 (Wa) 36690 [Portable Information Communication Device] <Kokubu>

89 2022-03-24 Restrictions on “Multiple-Multiple Dependent Claims”—Revised Examination Guidelines, explanatory materials, videos, and public-comment results have been released.

90 2022-03-25 IP High Court, 2019 (Ne) 10057 [Mixed Solution for Extracting Protein] <Otaka> = 2017 (Wa) 41474 <Tanaka>

91 2022-03-28 IP High Court, 2020 (Ne) 10045 [Dot Pattern] <Kanno> Support requirement: not satisfied; amendment requirements: not satisfied (added matter)

92 2022-03-29 Tokyo District Court, 2018 (Wa) 1233 [Support Structure for Concrete Foundations] <Kokubu> * Damages

93 2022-03-30 IP High Court, 2020 (Gyo-Ke) 10016 [Barbed Suture Having ... Concave-Convex Barbs] <Kanno>

94 2022-04-02 <Article> “Overview of Actions to Revoke JPO Trial Decisions in 2020”

95 2022-04-02 South Korean Supreme Court Judgment of April 8, 2021, 2019 Hu 10609

96 2022-04-02 <Article> “All Issues in Inventive Step” (Hideki Takaishi, January 2022)

97 2022-04-03 <Article> “Service of Process in US Civil Litigation and Responses by Japanese Companies” (Kazuma Segawa, Attorney Admitted in the District of Columbia)

98 2022-04-03 [Skit (Sword of Intellectual Property)] Incorporating Effects into Claims

99 2022-04-03 [Skit (Sword of Intellectual Property)] Broadening Further with a Divisional Application

100 2022-04-03 [Skit (Sword of Intellectual Property)] Put Various Things in the Original Description

101 2022-04-03 [Skit (Sword of Intellectual Property)] Craft the Original Description Based on Case Law

102 2022-04-04 <Article> “Protection of ‘Data (Structures)’ under Patent Law” (Tsutomu Shimohagiwara)

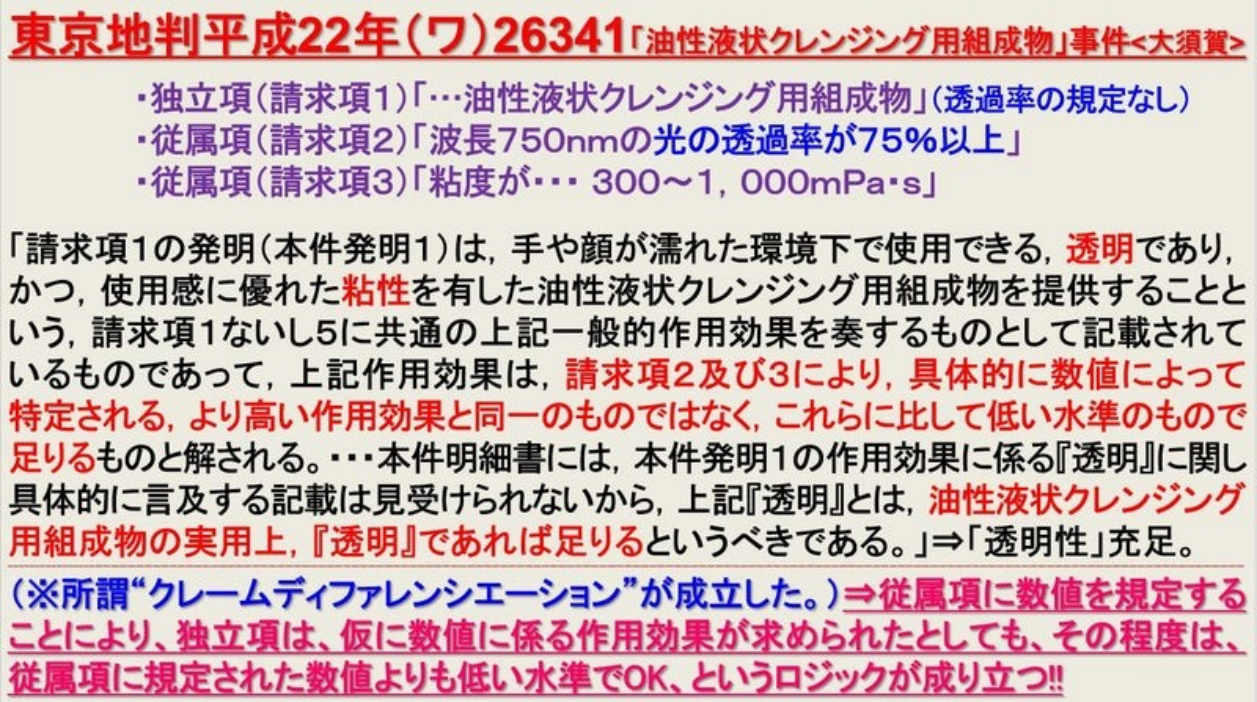
Tokyo District Court, 2010 (Wa) 26341, Oil-Based Liquid Cleansing Composition <Osuga>

Original Ameblo publication: 2022-01-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12719352846.html

Tokyo District Court, 2010 (Wa) 26341, Oil-Based Liquid Cleansing Composition <Osuga>



*An example of applying the enablement requirement in which the court held that a person skilled in the art could work the invention by appropriately changing the blending proportions

(The same applies to the support requirement.)

*In construing the claim wording “oil-based liquid cleansing composition,” the effect of “transparency” was treated as a claim limitation.

⇒ Ultimately, infringement was found because “transparency” was satisfied.

(Infringement was found even though the transparency was below the numerical value in the dependent claim.)

English translation of the figure

Tokyo District Court, 2010 (Wa) 26341, “Oil-Based Liquid Cleansing Composition” <Osuga>

Independent claim (Claim 1): “… an oil-based liquid cleansing composition” (no transmittance specified).
Dependent claim (Claim 2): “the transmittance of light having a wavelength of 750 nm is 75% or more.”
Dependent claim (Claim 3): “the viscosity is … 300–1,000 mPa·s.”

“The invention of Claim 1 (Invention 1 at issue) is described as providing an oil-based liquid cleansing composition that can be used when the hands or face are wet, is transparent, and has a viscosity giving an excellent feeling in use, which are the general functions and effects common to Claims 1 to 5. The above functions and effects are therefore interpreted as not being identical to the higher functions and effects specifically defined by numerical values in Claims 2 and 3, but as being sufficient at a lower level than those. … Since the specification at issue contains no description specifically referring to the ‘transparency’

of the functions and effects of Invention 1 at issue, the above transparency should be sufficient if the oil-based liquid cleansing composition is ‘transparent’ for practical use.” ⇒ The transparency requirement is satisfied.

(The so-called “claim differentiation” was established.) ⇒ Specifying numerical values in dependent claims establishes the following reasoning: even if the independent claim requires functions and effects relating to those numerical values, a lower level than the numerical values specified in the dependent claims is sufficient!!

<Excerpts from the judgment>

Infringement

• Independent claim (claim 1): “…an oil-based liquid cleansing composition” (no transmittance specified)

• Dependent claim (claim 2): “a transmittance of 75% or more for light at a wavelength of 750 nm”

• Dependent claim (claim 3): “a viscosity of … 300–1,000 mPa·s”

“The invention of claim 1 (Invention 1 at Issue) is described as producing the above general effects common to claims 1 through 5: providing an oil-based liquid cleansing composition that can be used when the hands or face are wet, is transparent, and has a viscosity that gives an excellent feel in use. Those effects are not identical to the higher effects specifically defined by numerical values in claims 2 and 3; a lower level than those is sufficient. … Since no passage in the Specification at Issue specifically addresses the meaning of ‘transparent’ in relation to the effects of Invention 1 at Issue, the above ‘transparent’ should be understood as requiring only that the oil-based liquid cleansing composition be ‘transparent’ for practical purposes.” ⇒ “Transparency” satisfied.

(*So-called “claim differentiation” was established.)

⇒ By specifying numerical values in a dependent claim, one can establish the logic that, even if the independent claim is required to produce the effects associated with those values, a level below the numerical values specified in the dependent claim is OK!!

Article 36(4) of the Patent Act (enablement requirement)

…The effect of Invention 1 at Issue is to provide an oil-based liquid cleansing composition that can be used when the hands or face are wet, is transparent, and has an appropriate viscosity. That effect is presented as common to the inventions of claims 1 through 5 of the Patented Invention at Issue. In addition to the features of Invention 1 at Issue, claim 2 limits the transparency aspect of those effects by light transmittance, showing that a higher effect may be obtained.

Accordingly, Invention 1 at Issue can be said to encompass cases falling within claim 2. … The “appearance” and “transmittance” in the descriptions of the Examples … in the Specification at Issue demonstrate the effects of claim 2. Thus, the Specification at Issue discloses a composition consisting of components (A) through (D) and states that the effects of claim 2 were obtained in that case. … Although the Specification at Issue does not describe the effects of the features of Invention 1 at Issue alone, it does demonstrate the effects of claim 2, which includes the features of Invention 1 at Issue, and therefore contains disclosure substantiating that Invention 1 at Issue produces its effects. …

Moreover, the Specification at Issue gives specific examples … of components (A) through (D), discloses preferred amounts of each component …, and shows specific combinations and amounts of the components in Examples 1 through 7. … A person skilled in the art who reads the Specification at Issue can therefore obtain an oil-based liquid cleansing composition producing the effects of Invention 1 at Issue by referring to that disclosure and appropriately determining the specific combinations and amounts of the substances used as components (A) through (D), in accordance with common general technical knowledge. This is also clear from the fact that oil-based liquid cleansing compositions producing the effects of Invention 1 at Issue

were obtained in the experiments conducted by the plaintiff and the defendant (Plaintiff's Exhibits 25, 27, 29, and 30; Defendant's Exhibit 2-8).

In this regard, the defendant argues that the Inventions at Issue lack enablement because even some compositions containing components (A) through (D) with blending proportions determined in accordance with the Examples in the Specification at Issue … lacked stability. However, … the defendant's experimental results concern either compositions in which, among the substances used as components (A) through (D) in the Examples in the Specification at Issue, component (C) was replaced with a substance different from that in the Examples and part of component (D) was likewise replaced, while the blending proportions of the components were kept identical to those in the Examples (…) or compositions in which decaglyceryl diisostearate, blended as component (E) in the Examples, was omitted and the proportion of the oil agent was increased by the corresponding amount (…). Although the defendant's experiments produced results such as a lack of stability, the plaintiff has submitted experimental results (…) showing that an oil-based liquid cleansing composition producing the effects of Invention 1 at Issue was obtained by changing the blending proportions without changing the substances used for each component from those in the defendant's experiments. Thus, a person skilled in the art can work Invention 1 at Issue by appropriately changing the blending proportions of components (A) through (D), taking into account the properties of each substance and so forth, in response to changes in the substances used as components (A) through (D) or the omission of component (E). Such appropriate changes in the blending proportions and so forth are possible in accordance with the common general technical knowledge of a person skilled in the art.

Article 36(6)(i) of the Patent Act (support requirement)

…The Specification at Issue describes specific examples of substances usable as components (A) through (D) and preferred blending proportions for each component. Moreover, … of the Specification at Issue states: "…The amount of the oil agent is desirably 40–95% by mass relative to the total amount of the oil-based liquid cleansing composition. Below 40% by mass, the effect of lifting makeup cosmetics from the skin is poor; above 95% by mass, rinsing off after blending with the makeup cosmetics becomes difficult"; … "…The amount of the dextrin fatty acid ester is preferably 0.5–5% by mass. Below 0.5% by mass, sufficient viscosity is difficult to obtain; above 5% by mass, transparent dissolution becomes difficult and the formulation tends to become too firm"; … "The ester of a fatty acid having 8–10 carbon atoms and polyglycerol is preferably blended in a range of 1–40%, particularly 5–25%, of the total composition of the cleansing composition of the present invention. Below 1%, the composition's cleansing and water-rinsing properties become insufficient; above 40%, possibilities include 'poor flowability, preventing maintenance of an oil-based liquid state' and 'problems such as skin irritation during use'"; and … "…The amount of the anionic surfactant is preferably 0.1–1% by mass. Below 0.1% by mass, the effect of transparently dispersing the dextrin fatty acid ester is difficult to obtain; at 1% by mass or more, the anionic surfactant may precipitate." These passages explain why the above blending proportions and so forth are preferred in relation to cleansing power when the skin is wet, transparency, stability, and viscosity. A person skilled in the art reading the Specification at Issue can therefore recognize from those passages that the problem addressed by the Inventions at Issue—providing an oil-based liquid cleansing composition that can be used when the hands or face are wet, is transparent, and has an appropriate viscosity—can be solved.

Accordingly, the Inventions at Issue do not lack the so-called support requirement. …

Original Ameblo publication: 2022-01-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12719429225.html

UK Supreme Court, [2017] UKSC 48, Actavis v. Eli Lilly

The Supreme Court decision that recognized the doctrine of equivalents for the first time in the United Kingdom.

Although the claims were narrowed by amendment during European prosecution, the court held that the amendment was intended to overcome an added-matter objection based on an impermissible intermediate generalization and merely satisfied the requirements for amendment.

German Federal Court of Justice, X ZR 29/15, Actavis v. Eli Lilly

If the reason for an amendment is to limit the subject matter over the prior art, the doctrine of equivalents is excluded. An amendment prompted by formal requirements (added matter or clarity), however, is not deemed a selection decision by the patentee, and the doctrine of equivalents is not excluded.

⇒ This has spread to Japan!

IP High Court, 2020 (Gyo-Ke) 10044, Lipid-Containing Composition <Otaka>

Original Ameblo publication: 2022-01-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12719914040.html

IP High Court, 2020 (Gyo-Ke) 10044, Lipid-Containing Composition <Otaka>

*Although the publication stated the numerical value, it did not suggest limiting the amount to that value or less.

The disclosure in Publication 5 neither states that the increase in “fat intake” to “40 g per day” is itself a problem nor suggests that it should be improved.

⇒ Super pro-patent!!?

(Excerpts from the judgment)

[Claim 19] …a lipid-containing formulation wherein the dose of ω-6 fatty acids is 40 g or less.

The defendant argues as follows: (1) Publication 5 states that fat intake has increased to 40 g per day and recognizes this as a problem. The invention of Publication 5 is based on curbing excessive intake of lipids (fat) and embodies the technical concept of consuming ω-6 and ω-3 fatty acids in a balanced manner. It is therefore natural to keep ω-6 fatty acids, a subset of unsaturated fatty acids that themselves constitute a subset of lipids, below a certain level, and there is strong motivation to specify an amount no greater than 40 g, which is recognized as excessive for lipids as a whole. (2) Moreover, daily lipid intake also comes from foods other than the drink composition of the invention of Publication 5. Setting an upper limit of 40 g or less of ω-6 fatty acids per day or per dose is therefore a technical matter that a person skilled in the art could readily accomplish. Accordingly, a person skilled in the art could easily have conceived of adopting, in the invention of Publication 5, the features of the claimed invention relating to Difference 2.

However, … the statement in Publication 5 that “The recent Japanese diet has become increasingly Westernized, with a substantial increase in opportunities to eat meat-centered meals and an increase in fat intake to 40 g per day. Accompanying this, the types of disease have also changed: cardiovascular diseases such as hypertension and heart disease, as well as breast cancer and colorectal cancer, have increased, likewise showing Westernization and becoming a major social problem,” neither states that the increase in “fat intake” to “40 g per day” is itself a problem nor suggests that it should be improved. Furthermore, even considering the disclosure of Publication 5 as a whole, it contains no description or suggestion that fat intake should be restricted to 40 g per day, or that the “dose of ω-6 fatty acids” should be “40 g or less” per day or per dose. In addition, in this case there is no other evidence sufficient to establish that making the “dose of ω-6 fatty acids 40 g or less” was common general technical knowledge. …

IP High Court, 2020 (Gyo-Ke) 10132, Therapeutic Agent for Osteoporosis <Kanno>

Original Ameblo publication: 2022-01-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12720173501.html

IP High Court, 2020 (Gyo-Ke) 10132, Therapeutic Agent for Osteoporosis <Kanno>

*Unpredictable and remarkable effects

It is permissible to take into account the effects of the cited invention selected as having features close to those of the invention at issue, as well as effects of the same kind already achieved in the state of the art.

= IP High Court, 2020 (Gyo-Ke) 10056 <Kanno>

= IP High Court, 2020 (Gyo-Ke) 10004 <Kanno>

<Excerpts from the judgment>

Whether the effects of an invention are unpredictable and remarkable must be examined from the perspectives of whether, as of the reference date for assessing patentability, a person skilled in the art could not have predicted that the features of the invention would produce those effects, and whether the effects are remarkable in exceeding the range of effects that a person skilled in the art could have predicted from those features (Supreme Court, 2018 (Gyo-Hi) No. 69 …). Nevertheless, … it is permissible to take into account the effects of the cited invention selected as having features close to those of the invention at issue, as well as effects of the same kind already achieved in the state of the art. … The effects must be regarded as within the range that a person skilled in the art could have predicted from the features of the Invention at Issue.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-90550.pdf

IP High Court, 2020 (Gyo-Ke) 10106, Reading Device <Mori>

Original Ameblo publication: 2022-01-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12720173926.html

IP High Court, 2020 (Gyo-Ke) 10106, Reading Device <Mori>

*Eligibility as a cited invention denied (“Exhibit Ko 1 Invention 2”)

⇒ If standalone use is not contemplated, eligibility as a cited invention fails.

The “read/write module 200” of the Exhibit Ko 1 Invention cannot, on its own, be recognized as the “reading device” to be compared with the Invention at Issue.

(Excerpts from the judgment)

…The “read/write module 200” of the Exhibit Ko 1 Invention is not contemplated as being used on its own without a “barrier”; in other words, prevention of radio-wave leakage or interference by the “read/write module 200” alone is not contemplated. The function of preventing radio-wave leakage to the outside or interference is indispensable to the “reading device” to be compared with the Invention at Issue. Accordingly, the “read/write module 200” of the Exhibit Ko 1 Invention cannot, on its own, be recognized as the “reading device” to be compared with the Invention at Issue. It follows that Exhibit Ko 1 Invention 2 cannot be identified and compared with the Invention at Issue in the manner adopted in the Trial Decision at Issue.

…The defendant cites … as publicly known publications and the like that treat a reading device as an independent invention. However, the configuration of the “read/write module 200” of the Exhibit Ko 1 Invention differs from the technologies described in those prior publications. The defendant’s argument therefore does not affect the above … conclusion.

IP High Court, 2020 (Gyo-Ke) 10115, Beauty Device <Kanno>

Given the wording “may be spherical or of any other arbitrary shape,” it is natural to understand a “sphere” as the primary shape contemplated.

⇒ No motivation to make the central handle of the primary reference elongated. There is a teaching away.

= IP High Court, 2020 (Gyo-Ke) 10057 <Kanno>

<Excerpts from the judgment>

Exhibit Ko 1 recites in claim 1 a “central handle of arbitrary shape,” and its detailed description states that the central handle gripped by the user “may be spherical or of any other arbitrary shape.” It can therefore be understood not to exclude an elongated handle. However, given the wording “may be spherical or of any other arbitrary shape,” it is natural to understand a “sphere” as the primary shape contemplated. Moreover, the accompanying drawings … in Exhibit Ko 1 are all front views of the device and are said to depict embodiments; in light of the shape of the handle and the overall balance shown, they can only be understood to disclose a spherical handle. … Even if the handle may have an arbitrary shape and is not limited to a sphere, making the spherical handle of the Exhibit Ko 1 Invention elongated would create a problem with operability. Thus, there is no motivation to make the central handle of the Exhibit Ko 1 Invention elongated when only a spherical embodiment is disclosed. … Rather, there is a teaching away. …

IP High Court, 2020 (Gyo-Ke) 10134, System for Controlling Digital Art Distribution and Viewing and Image Formation over the Internet <Mori>

*The primary and secondary references concern different technical fields.

It is difficult to find the application obvious merely because they belong to a broad technical field, without considering their relationship or any other circumstances.

⇒ Inventive step affirmed.

<Excerpts from the judgment>

…Whereas the Exhibit Ko 3 Technology concerns a peer-to-peer system …, the Cited Invention can perform compound tasks such as content ingestion, automatic publishing, distribution, storage, and monetization, and is understood as a method that itself actively performs content ingestion, distribution, and so forth. The Exhibit Ko 3 Technology and the Cited Invention therefore differ in technical field to no small degree. In this regard, it is difficult to find that a person skilled in the art could easily have conceived of applying the Exhibit Ko 3 Technology to the Cited Invention merely because they fall within the broad technical field of "methods for transmitting and receiving data among a transmitting client, a receiving client, and a server," without considering their relationship or any other circumstances. Nor can any other passage in Exhibit Ko 3 be recognized as providing motivation or a suggestion to apply the Exhibit Ko 3 Technology to the Cited Invention.

Original Ameblo publication: 2022-01-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12721028813.html

Osaka District Court, 2020 (Wa) 3247, Device for Detecting Water-Leak Locations in Water Supply Piping <Sugiura>

*Bringing a patent infringement action was held to constitute a tort!!

⇒ ¥500,000 awarded.

“The plaintiff had not necessarily conducted its own proactive investigation, before bringing this action, into the leak-detection method used by the defendant or the equipment used for that method.”

(Excerpts from the judgment)

In the series of exchanges between the plaintiff and the defendant, although the defendant sometimes responded that its method “does not violate the law, including by patent infringement,” the plaintiff never mentioned why it believed the method and so forth used by the defendant infringed the plaintiff’s patent rights. Moreover, the first time the plaintiff asked questions or the like about the specific leak-detection method used by the defendant and the equipment used for it was in its “Final Notice” dated February 7, 2018. In addition, in light of the plaintiff’s arguments and evidence in this case, particularly the plaintiff’s own statement that “Until filing the lawsuit, I had no way of knowing the method the defendant was using,” and the fact that the plaintiff has actually presented its arguments and evidence on the premise of the configuration of the Defendant’s Device as asserted by the defendant, it appears that the plaintiff had not necessarily conducted its own proactive investigation, before bringing this action, into the leak-detection method used by the defendant or the equipment used for that method. Considering these circumstances leading to the filing of the action, the course of the litigation, and so forth, as well as the fact that, as stated above, the Defendant’s Device does not fall within the technical scope of any of the Inventions at Issue, it is appropriate to view the plaintiff as having deliberately brought this action to impede the defendant’s business development—that is, to interfere with its business—even though at least an ordinary person could easily have known that the rights or legal relationship asserted in this action lacked a factual and legal basis. Thus, the plaintiff’s institution of this action is found to be markedly unreasonable in light of the purpose and objectives of the judicial system and constitutes a tort against the defendant.

*Adding a combination of matters described independently in two paragraphs of the specification ⇒ Addition of new matter.

⇒ Correction requirements not satisfied.

“Because the configurations described in the respective passages are independent of each other, what is disclosed there consists of separate technical matters, and …”

[(Corrected) Claim 1] A step of forming grooves on at least one of the upper and lower surfaces of a first tuning-fork arm, on both sides of a neutral line while leaving that neutral line intact, so that the partial width including said neutral line is less than 0.05 mm and the width of each groove is less than 0.04 mm; and a step of forming grooves on at least one of the upper and lower surfaces of a second tuning-fork arm, on both sides of a neutral line while leaving that neutral line intact, so that the partial width including said neutral line is less than 0.05 mm and the width of each groove is less than 0.04 mm; …

(Excerpts from the judgment)

…Paragraph [0041] of the Patent Specification at Issue describes a configuration in which grooves are formed on both sides of a neutral line while leaving that neutral line intact, the partial width W7 of the tuning-fork arm including the neutral line is less than 0.05 mm, and the width of each groove is less than 0.04 mm. It also states that this configuration can make M1 greater than Mn. Paragraph [0043] states that the tuning-fork-shaped flexural crystal resonator used in the crystal oscillators of the first through fourth embodiments, in which grooves are provided in the tuning-fork arms so as to straddle (include) the neutral line, is configured such that the capacitance ratio r1 in fundamental-mode vibration is smaller than the capacitance ratio r2 in second-harmonic-mode vibration. It further states that this configuration makes the frequency change of a flexural crystal resonator vibrating in the fundamental mode greater than that of a flexural crystal resonator vibrating in the second-harmonic mode for the same change in load capacitance CL.

However, the configurations described in paragraphs [0041] and [0043] above are independent of each other. What is disclosed there consists of separate technical matters; these passages cannot be combined to say that they disclose the Added Matter at Issue, namely, that “where grooves are formed on both sides of a neutral line while leaving said neutral line intact, such that the partial width including said neutral line is less than 0.05 mm and the width of each groove is less than 0.04 mm, the capacitance ratio r1 in fundamental-mode vibration is smaller than the capacitance ratio r2 in second-harmonic-mode vibration, and the figure of merit M1 in the fundamental mode is greater than the figure of merit Mn in harmonic-mode vibration.” … Accordingly, the addition of the Added Matter at Issue must be regarded as introducing a new technical matter in relation to the technical matters derived by considering all the disclosures in the Patent Specification and Other Documents at Issue together.

[Patent ★] A case holding that a combination of three particular compounds separately described in the specification constituted added matter (a violation of the amendment requirements), because no basis was disclosed for the combination being inevitable — NAKAMURA & PARTNERS— Tokyo District Court, 2019 (Wa) No. 30991 <Presiding Judge Tanaka> [2,3-Dichloro-1,1,1-Trifluoropropane, 2-Chloro-1,1,1-Trifluoropropene, 2-Chlorowww.nakapat.gr.jp

IP High Court, 2016 (Gyo-Ke) 10257, Portable Information Communication Device <Mori>

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12722094731.html

IP High Court, 2016 (Gyo-Ke) 10257, Portable Information Communication Device <Mori>

*Adding a combination of matters described independently in two paragraphs of the specification ⇒ Addition of new matter.

“Paragraph [0143] contains no disclosure suggesting a relationship with the cases of browsing a web page or displaying television video described in paragraphs [0117] and [0118].”

(Excerpts from the judgment)

C. The plaintiff argues that Function A of the Invention-Defining Matter at Issue is derived by a person skilled in the art by considering together the disclosures in paragraphs [0117], [0118], [0120], [0143], and so forth of the Specification at Issue.

(a) However, paragraph [0117] does not describe downloading an image data file from a web server; it describes browsing a web page. The “page image” in that paragraph is an image of a web page displayed by a browser and cannot be regarded as a disclosure concerning downloading image data as a data file.

Moreover, that paragraph states that, when the web page being browsed uses a fixed-width layout wider than the horizontal screen resolution of LCD panel 15A, central processing circuit 1_10A1 generates a command to render a page image with the same number of horizontal pixels as that fixed width and writes it to VRAM 1_10C, while graphics controller 1_10B extracts bitmap data for an image having the same resolution as the screen resolution of LCD panel 15A and transmits it to LCD driver 15B. However, “as a result, the page image is displayed in a scrolling manner on LCD panel 15A.” Because the signal transmitted to LCD driver 15B is a signal containing bitmap data corresponding to a portion of the image, it cannot be said that, in this case, the resolution is changed from an image whose original resolution is greater than the screen resolution of the display panel to an image having the same resolution as the screen resolution of the display panel.

Next, paragraph [0118] describes the functions of graphics controller 1_10B, VRAM 1_10C, and so forth when mobile telephone 1 is used to watch television programs. Since the “image” displayed by mobile telephone 1 is the “image of a television program” received by television reception antenna 112A, this must be distinguished from downloading image data as a data file.

Furthermore, paragraph [0143] contains no disclosure suggesting a relationship with the cases of browsing a web page or displaying television video described in paragraphs [0117] and [0118]. Its disclosure is as stated above and describes displaying an image data file without changing its resolution. A person skilled in the art who reads paragraph [0143] therefore cannot be expected to associate it with paragraphs [0117] and [0118] and understand it as disclosing changing the resolution of an image file when downloading an image data file from a web server and displaying the image.

(b) Paragraph [0120] states that “digital audio signals and/or digital moving-image signals are converted into data files and stored, or the stored data files are read out and subjected to the necessary processing,” and that “image data files and/or audio data files can also be stored by accessing a website, … having central processing circuit 1_10A1 receive the received and converted digital signals via bus 19, perform the necessary conversion, and write them to flash memory 14A.” However, paragraph [0120] merely describes converting received “digital audio signals and/or digital moving-image signals” into data files in mobile telephone 1 and storing them, or reading them out for playback. Even considering that disclosure together

with paragraph [0143], the content of which is described above, a person skilled in the art cannot be expected to conceive of the function of reading bitmap data of an image having the same resolution as the screen resolution of the display panel from VRAM, generating a digital display signal conveying the bitmap data read out, and transmitting it to the display control means, when downloading from a web server an image data file whose original resolution is greater than the screen resolution of the mobile telephone's display panel and displaying the image.

(c) Accordingly, even considering together the respective disclosures in the Specification at Issue relied upon by the plaintiff, they cannot be found to yield the function relating to Correction Matter 7 of "when downloading an 'image data file whose original resolution is greater than the screen resolution of the display panel' from said web server and displaying the image, reading 'bitmap data of an image having the same resolution as the screen resolution of said display panel' from said VRAM, generating 'a digital display signal conveying said bitmap data read out,' and transmitting said digital display signal to said display control means." There is no other description or suggestion in the Specification at Issue concerning implementation of that function.

D. Therefore, Correction Matter 7 cannot be regarded as having been made within the scope of the matters disclosed in the Specification and Other Documents at Issue.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12722272844.html

IP High Court, 2020 (Gyo-Ke) 10027, Sensor Assembly for Body Fluids <Mori>

*Numerical values are matters of design choice.

In view of the respective disclosures in the cited reference … and in general, … changing the dimensions of a spacer groove according to sample size, sample amount, and so forth is a matter appropriately undertaken by a person skilled in the art.

⇒ Making the dimensions of the spacer's cutout groove … is obvious.

(Excerpts from the judgment)

In view of the respective disclosures … and the general principle that, for devices performing biochemical component analysis using electrodes, changing the dimensions of a spacer groove according to sample size, sample amount, and so forth is a matter appropriately undertaken by a person skilled in the art, making the dimensions of the spacer's cutout groove "10–50 mm in length, 1–5 mm in width, and 0.2–0.6 mm in depth" (giving an internal volume of 2–150 μL when calculated on this basis) must be regarded as something a person skilled in the art could readily have conceived.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-90218.pdf

Tokyo District Court, 2019 (Wa) 30991, Composition Containing … or 2,3,3,3-Tetrafluoropropene <Tanaka>

Original Ameblo publication: 2022-01-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12722444687.html

Tokyo District Court, 2019 (Wa) 30991, Composition Containing … or 2,3,3,3-Tetrafluoropropene <Tanaka>

*The original specification disclosed no basis for a combination of three particular compounds, each separately described, being inevitable.

— Nor did it state any reason for focusing on these compounds.

⇒ Amendment requirements not satisfied (addition of new matter).

(Excerpts from the judgment)

…Through the … amendment (the Amendment at Issue), claims 1 and 2 … of the Claims at Issue came to contain the wording "comprising … HFO-1243zf and HFC-245cb in an amount greater than zero weight percent and less than 1 weight percent." …

In the first place, the Original Specification does not in any way describe selecting, from among the many compounds listed as "additional compounds" to HFO-1234yf, the particular combination of HFO-1243zf and HFC-245cb. In this regard, although HFO-1234yf, HFO-1243zf, and HFC-245cb are each separately described in the Original Specification, they are not described as a combination of three particular compounds, nor is any basis disclosed for that particular combination of three compounds being inevitable. Furthermore, Table 6 (Example 16) lists eight compounds and an "unknown" component, but the Original Specification states no reason for focusing on "245cb" and "1234yf" among them. Moreover, the Original Specification describes many compounds not included in Table 6, as listed in claim 1 as originally filed. Nevertheless, selecting HFO-1243zf alone from among them and combining it with HFC-245cb and HFO-1234yf to form a configuration combining three compounds would require disclosure motivating a person skilled in the art to derive such a configuration, and no such disclosure can be found. (There is no evidence sufficient to establish that, between the priority date claimed for the Patent at Issue and the filing date, any disclosure was made to a different effect from the foregoing explanations.) …

[Patent ★] A case holding that a combination of three particular compounds separately described in the specification constituted added matter (a violation of the amendment requirements), because no basis was disclosed for the combination being inevitable — NAKAMURA & PARTNERS— Tokyo District Court, 2019 (Wa) No. 30991 <Presiding Judge Tanaka> [2,3-Dichloro-1,1,1-Trifluoropropane, 2-Chloro-1,1,1-Trifluoropropene, 2-Chlorowww.nakapat.gr.jp

[Gas Dissolution Apparatus] Can a Person Skilled in the Art Recognize that the Problem Can Be Solved When 0.8 < L < 1.4?

Original Ameblo publication: 2022-01-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12722979001.html

[Gas Dissolution Apparatus] Can a person skilled in the art recognize that the problem can be solved when 0.8 < L < 1.4?

(1) Tokyo District Court, 2017 (Wa) 13797 <Sato>

*It must be possible to recognize that the problem can be solved throughout the entire numerical range.

⇒ Support requirement not satisfied.

(2) IP High Court, 2019 (Gyo-Ke) 10025 <Otaka>

*The problem addressed by the invention was understood in abstract terms.

⇒ Support requirement satisfied.

*The different outcomes on the support requirement for the same patent, JP6116658, may partly reflect a change in the judges making the decision. However, I believe the difference is one of timing: (1) was a judgment during the two dark years, whereas (2) was a judgment after the pro-patent turn on the support requirement following the Pyrimidine Grand Panel decision.

⇒ Under the approach used in (1), many numerical-limitation inventions and parameter inventions would violate the support requirement!!

(Excerpts from judgment (1))

(a) …The Correction at Issue specifies the internal diameter and length of the "narrow tube" in claim 1 as "a narrow tube having an internal diameter greater than 1.0 mm and not greater than 3.0 mm (excluding those having a length of 0.8 m or less)." According to the wording of claim 1 after the Correction at Issue, the length of the corrected "narrow tube" encompasses all lengths greater than 0.8 m.

(b) The objectives of the Corrected Invention at Issue are (1) to dissolve a gas in a liquid in a supersaturated state and provide it while stably maintaining that supersaturated state, and (2) to provide a gas dissolution apparatus that can readily be attached to a water dispenser or the like. … Concerning the supersaturated concentration to be maintained, the Specification and Other Documents state that "the supersaturated state can be maintained by being greater than 2.0 ppm." … Regarding the "tubular passage" of the Corrected Invention at Issue, … they state that "depending also on the pressure of the liquid flowing inside it, tubular passage 5a is preferably relatively long and has a small diameter." According to these passages, stably maintaining the supersaturated state, which is the problem addressed by the Corrected Invention at Issue, requires a supersaturated concentration greater than 2.0 ppm. However, as to the length of the tubular passage (narrow tube), the only disclosure is that a relatively long length is preferred; it is unclear what specific length would solve the problem addressed by the Corrected Invention at Issue.

(c) Turning to the Examples and Comparative Examples disclosed in the Specification and Other Documents at Issue, Examples 1 through 13 reportedly used narrow tubes 1.4 m to 4 m long and obtained hydrogen water in a supersaturated state that could be maintained continuously. By contrast, the Comparative Examples reportedly used narrow tubes 0.4 m and 0.8 m long but could not obtain hydrogen water in a supersaturated state of 2.0 ppm or above. … The Examples and Comparative Examples … show that the problem addressed by the Corrected Invention at Issue can be solved using narrow tubes 1.4 m to 4

m long, but cannot be solved using narrow tubes 0.8 m or less in length. They do not, however, show results demonstrating that a narrow tube longer than 0.8 m but shorter than 1.4 m can produce hydrogen water capable of solving that problem.

(Excerpts from judgment (2))

The Correction at Issue … changed "a tubular passage serving as a pressure-reducing transfer means" to "a tubular passage serving as a pressure-reducing transfer means consisting of a narrow tube having an internal diameter greater than 1.0 mm and not greater than 3.0 mm (excluding those having a length of 0.8 m or less)," thereby limiting the numerical values for the internal diameter and length of the narrow tube. …

…The Specification at Issue is found to disclose that the problem addressed by Patented Invention 1 at Issue is to provide a "gas dissolution apparatus" that "dissolves a gas in a liquid in a supersaturated state and stably maintains that supersaturated state," and that, as the means for solving that problem, it adopts a configuration in which "a pressure-reducing transfer means is provided and the pressure applied to the liquid is further adjusted." …

It is common general technical knowledge that a larger value of pressure Y in the pressurized gas dissolution means allows more gas to dissolve in the liquid but may increase the velocity of the liquid flowing through the narrow tube, and that a larger value of narrow-tube length L may decrease the velocity of the liquid through resistance from the inner wall of the tube. … Where the internal diameter X of the narrow tube and the flow rate of hydrogen water are the same, it can be understood that the hydrogen concentration can be increased by selecting the respective values so that the rate of increase in pressure Y of the pressurized gas dissolution means exceeds the rate of increase in narrow-tube length L.

…From the detailed description of the invention in the Specification at Issue and common general technical knowledge, a person skilled in the art would understand that the gas dissolution apparatus of Patented Invention 1 at Issue generates hydrogen water by dissolving hydrogen in water and discharges it through an outlet; that it comprises gas generation means for generating a gas, pressurized gas dissolution means for pressurizing and dissolving the gas in a liquid, a dissolution tank for receiving the gas-containing liquid and maintaining it in solution and in storage, and pressure-reducing transfer means for reducing the pressure as the liquid flows through a tubular passage consisting of a narrow tube; and that its characteristic lies in preventing pressure fluctuations within the tubular passage caused by discharge of hydrogen water from the outlet and forming laminar flow within that passage through the pressure-reducing transfer means, rather than necessarily in strict numerical control. For example, even when the internal diameter X of the narrow tube is greater than 1.0 mm and not greater than 3.0 mm, and the length L is within a numerical range greater than 0.8 m and less than 1.4 m, the skilled person can take into account that "where the internal diameter X and the hydrogen-water flow rate are the same, the hydrogen concentration can be increased by increasing pressure Y of the pressurized gas dissolution means; and, where both pressure Y and narrow-tube length L are increased, the hydrogen concentration can be increased by selecting the respective values so that the rate of increase in pressure Y exceeds the rate of increase in narrow-tube length L." … By selecting X, Y, and L to form laminar flow in the hydrogen water within the tubular passage consisting of the narrow tube, the skilled person can recognize that the problem of Patented Invention 1 at Issue —"dissolving a gas in a liquid in a supersaturated state and stably maintaining that supersaturated state"— can be solved.

Osaka District Court, 2015 (Wa) 5869, Scour Prevention Material for Underwater Structures <Morisaki>

Original Ameblo publication: 2022-01-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12722980329.html

Osaka District Court, 2015 (Wa) 5869, Scour Prevention Material for Underwater Structures <Morisaki>

*If the publicly worked product falls within the numerical range, public working is established even without recognition of the range!!

“The plaintiff argues … that the numerical limitations would not be recognized, but if the manner of use of the publicly worked OB Net Unit falls within the above limited numerical values … then … the invention was publicly worked.”

(Excerpts from the judgment)

[Claim 1] …A scour prevention material for underwater structures, wherein the amount of lump material filling the bag body is such that, when the bag body is lifted by a suspension rope, 25%–80% of the height of the scour prevention material formed into a conical shape constitutes a conical void containing no lump material.

The plaintiff argues that, to the extent of the recognition described above, the numerical limitation “formula $3 \leq N/M \leq 20$” in constituent feature A or “25%–80%” in constituent feature E of the Invention at Issue would not be recognized. However, if the manner of use of the publicly worked OB Net Unit falls within the above limited numerical values—that is, corresponds to a subordinate concept of the Invention at Issue—it is proper to say that the Invention at Issue was publicly worked. The plaintiff’s argument on this point is therefore without merit.

A person skilled in the art reading the Original Specification would understand that the “specific item” is not something “stored and retained in an item box.”

⇒ The invention-defining matter … of “storing and retaining a ‘specific item’ in an ‘item box’” constitutes added matter.

(Excerpts from the judgment)

…A person skilled in the art reading the Original Specification would understand that the “specific item” is not something “stored and retained in an item box.” Accordingly, the new invention-defining matter of “an item storage function that stores said specific item in association with an item box associated with said user,” which means “storing and retaining a ‘specific item’ in an ‘item box,’” cannot be regarded as falling within the scope of the technical matters derived by a person skilled in the art from considering all the disclosures in the Original Specification and Other Documents together.

IP High Court, 2019 (Gyo-Ke) 10159, X-Ray Fluoroscopy Imaging Apparatus <Kanno>

Original Ameblo publication: 2022-01-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12723163707.html

IP High Court, 2019 (Gyo-Ke) 10159, X-Ray Fluoroscopy Imaging Apparatus <Kanno>

It is entirely possible to regard the invention as significant for newly identifying the matter as a problem to be solved. …

It cannot be said that there is motivation, premised on the existence of such a problem, to adopt the features constituting the difference from the Cited Invention. …

"It is entirely possible to regard the claimed invention as significant for focusing on the operator's convenience and newly identifying, from the operator's perspective, a problem to be solved in order to facilitate image adjustment. …

Cited Document 1 neither describes nor suggests the problem (Problem B2) that the viewing direction of the 'operator,' who operates while looking at 'operating liquid crystal display device 21,' does not coincide with the direction in which the 'surgeon,' who looks at 'diagnostic image monitor device 17,' views the 'subject.' … It cannot be said that there is motivation, premised on the existence of such a problem, to adopt the features constituting the difference from the Cited Invention. …"

=IP High Court, 2010 (Gyo-Ke) 10075, Ventilation Fan Filter <Iimura>

(Excerpts from the judgment: X-Ray Fluoroscopy Imaging Apparatus)

…The defendant argues that … a person skilled in the art would … refer to the well-known problem … of aligning an image with each operator's direction of viewing the subject (viewing direction), where "operators" face the subject from different directions in an image display device showing the affected part of a subject during surgery, and would naturally identify the problem of aligning the orientation of the image on operating liquid crystal display 21 viewed by an operator facing the subject from a different direction with that operator's direction of viewing the subject (viewing direction), thereby providing motivation to apply Technical Matter 2 to the Cited Invention. However, … as the plaintiff argues, in light of the difference in relative authority and roles between the surgeon and the operator, operators previously concentrated on adjusting the image in the direction desired by the surgeon, in accordance with the surgeon's instructions, without specifically recognizing such a problem; by contrast, it is entirely possible to regard the claimed invention as significant for focusing on the operator's convenience and newly identifying, from the operator's perspective, a problem to be solved in order to facilitate image adjustment. …

The difference between the claimed invention and the Cited Invention is solely that the claimed invention "comprises an image rotation mechanism that rotates only the X-ray image displayed on said display unit among said X-ray images," whereas the Cited Invention contains no such specification (the image rotation mechanism itself in the claimed invention is nothing new). However, Cited Document 1 neither describes nor suggests the problem (Problem B2) that the viewing direction of the "operator," who operates while looking at "operating liquid crystal display device 21," does not coincide with the direction in which the "surgeon," who looks at "diagnostic image monitor device 17," views the "subject." The documents submitted by the defendant are insufficient to establish the existence of a problem, in an image display device showing the affected part of a subject during surgery, of aligning the orientation of the image on operating liquid crystal display 21 viewed by an operator facing the subject from a different direction with that operator's direction of viewing the subject (viewing direction). Therefore, there is no motivation,

premised on the existence of such a problem, to adopt the features constituting the difference from the Cited Invention. Moreover, the Trial Decision at Issue erred in identifying Technical Matter 2, and it cannot be said that the features constituting that difference would be conceived from the matters disclosed in Cited Document 2 (Technical Matter 2′). Accordingly, the claimed invention ultimately cannot be regarded as one that a person skilled in the art could readily have conceived based on the Cited Invention and Technical Matter 2′ disclosed in Cited Document 2. The contrary conclusion in the Trial Decision at Issue is erroneous, without any need to decide the remaining issues.

(Excerpts from the judgment: Ventilation Fan Filter)

…Whether an invention could readily have been conceived is a comprehensive determination. Thus, finding that an invention was obvious may require not only that "adopting a particular configuration to solve the problem was easy," but also that "setting the problem to be solved was easy." In other words, even if "adopting a particular configuration to solve the problem was easy," where "the setting of, or focus on, the problem to be solved was unique" (for example, where a problem not generally conceived was identified), the invention cannot automatically be said to be obvious. Since assessing whether "setting the problem to be solved was easy" concerns the ease of the conception itself, hindsight and subjective judgments are liable to intrude. A logical explanation based on evidence is therefore indispensable to prevent such judgments. It also goes without saying that, as a premise, accurately understanding the problem the invention sought to solve is particularly important in reaching a conclusion on obviousness. …

…Even the examples in Exhibits Ko 18, 19, 32, and so forth do not show the setting of the problem of "facilitating easy separation after use of a metal filter frame and a nonwoven filter material in a ventilation fan filter in which they are bonded by an adhesive, while maintaining a strong bond under ordinary conditions." A person skilled in the art therefore cannot be regarded as having been able readily to conceive of the features of Invention 1 at Issue differing from Invention A by applying the invention disclosed in Exhibit Ko 2 to Invention A. In other words, Exhibit Ko 2 does not suggest proceeding from Invention A to the characteristic feature of Invention 1 at Issue, namely, "using an aqueous emulsion adhesive containing a film-forming polymer (which bonds firmly under ordinary conditions but whose adhesive strength decreases upon immersion in water, allowing the metal filter frame and nonwoven filter material to be separated easily)." Ultimately, therefore, applying the invention disclosed in Exhibit Ko 2 to Invention A cannot be regarded as easy.

*Objects covered by 28 U.S.C. § 1782: necessity of examining the evidence denied.

“The above request for inspection and applications for an order to present objects for inspection and an order to produce documents are unnecessary to prove public working.”

(Excerpts from the judgment)

5. Request for inspection and applications for an order to present objects for inspection and an order to produce documents

Regarding their allegations of public working at Macworld and elsewhere and through the iPhone guided tour, the defendants requested inspection of, and an order to present for inspection, (1) the iPhone used in the demonstration at Macworld 2007, (2) the iPhone used in the demonstration in the iPhone guided tour, and (3) an iPhone installed with an executable file of the same version of the operating system installed on the iPhones in (1) and (2). They also applied for an order to produce a recording medium containing the source code for executing the same operating system as that installed on the iPhones in (1) and (2). However, the above request for inspection and applications for an order to present objects for inspection and an order to produce documents are unnecessary to prove public working, and all are therefore dismissed.

[Patents] Orders to Produce Documents (4): Gathering Evidence through U.S. Discovery for Use in Japan (U.S.C. § 1782)#Patents #OrdersToProduceDocuments #Discovery #Discovery #USC1782 #Intel #EvidenceGathering [Patents] Orders to Produce Documents (4): Gathering Evidence through U.S. Discovery for Use in Japan (U.S.C. § 1782) (Hideki Takaishi, Attorney-at-law, Patent Attorney, and California Attorney) ★ Download the presentation materials here...www.youtube.com

IP High Court, 2020 (Gyo-Ke) 10030, Drain Plug Device <Otaka>

Original Ameblo publication: 2022-01-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12723523451.html

IP High Court, 2020 (Gyo-Ke) 10030, Drain Plug Device <Otaka>

Even well-known technology requires motivation to combine.

⇒ No motivation (inventive step affirmed).

*Former Judge Shimizu stated that motivation is unnecessary for well-known technology if the technical field is the same, but the context was that “well-known technology” means technology so well known that motivation is unnecessary.

(Excerpts from the judgment)

Even considering the entire disclosure of Exhibit Ko 1 (including its drawings), … there is no passage suggesting a problem requiring improvement in terms of mounting strength, watertightness, or the like. … Exhibits Ko 3, 5, and 8 concerning the Well-Known Technology at Issue contain no discussion of the action or the like of the configuration in which an inward flange formed at the bottom of a cylindrical recessed portion is mounted by being clamped between a drain fitting and a connecting pipe. Nor do Exhibits Ko 3, 5, and 8 suggest that, in terms of mounting strength, watertightness, or the like, the configuration in which an inward flange is mounted by being clamped between a drain fitting and a connecting pipe is superior to the configuration shown in the drawings of Exhibit Ko 1, in which edge portion 2 is mounted by being clamped between drain cup 6 and drain casing 3. … A person skilled in the art who reads Exhibit Ko 1 cannot be said to recognize a problem with the configuration of edge portion 2 of the Exhibit Ko 1 Invention in terms of mounting strength or watertightness. Accordingly, motivation to apply the configuration of the Well-Known Technology at Issue to edge portion 2 of the Exhibit Ko 1 Invention cannot be found.

Osaka District Court, 2007 (Wa) 2076, Combination Weighing Apparatus

Original Ameblo publication: 2022-01-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12723691765.html

Osaka District Court, 2007 (Wa) 2076, Combination Weighing Apparatus

*Sales to overseas customers were used as the basis for the damages calculation.

(A general principle was also stated.)

Cf. The Intellectual Property High Court Grand Panel decision, 2012 (Ne) 10015, "Waste Storage Device," also concerned overseas lost profits of the plaintiff (a foreign corporation).

*Although the patent was corrected after expiration of its term, negligence was presumed under Article 103 of the Patent Act.

(Excerpts from the judgment)

The evidence … and the entire purport of oral argument establish that, during the term of the Patent at Issue …, the defendant manufactured and sold 236 units of the Defendant's Products for the domestic market and 4,562 units for foreign markets; that during that period sales of the Defendant's Products for the domestic market amounted to ¥915,598,000 and those for foreign markets amounted to ¥25,537,859,000; that gross profit, calculated by deducting cost of sales from sales, was ¥85,938,000 for domestic sales and ¥6,965,416,000 for foreign sales; and that operating expenses associated with sales of the Defendant's Products (the total of selling expenses and general administrative expenses) were ¥455,759,000 for domestic sales and ¥4,829,031,000 for foreign sales. … It is appropriate to calculate the defendant's marginal profit by deducting from the gross profit associated with sales of the Defendant's Products the respective portions of the defendant's foreign operating expenses (… yen …) and domestic operating expenses (… yen …). …

Needless to say, the Patent Right at Issue is effective only within Japan. However, as the patentee, the plaintiff exclusively holds the right not only to manufacture products embodying the Patented Invention at Issue in Japan and sell them in Japan in the course of business, but also to work the invention by manufacturing such products in Japan and selling (exporting) them to foreign customers and others in the course of business. The plaintiff has exclusive rights under the Patent Right at Issue over these acts of working. … The defendant established … YDW … as a sales company in the United States; received, through YDW, orders compiling customers' requirements for the model, specifications, and presence or absence of accessories of the Defendant's Products; manufactured the products in Japan; sold them initially to YDW; and then delivered them to customers. It is also established that the Defendant's Products were sold to customers in foreign countries other than the United States in the same manner. These acts plainly infringe the plaintiff's above exclusive rights, and it is equally clear that they deprived the plaintiff of profits it could have obtained based on those rights. …

Even if the plaintiff and its affiliate have brought damages actions in Europe under patent EP268346 against the defendant's customers concerning the same Defendant's Products manufactured and sold by the defendant as those at issue in this litigation, patent EP268346 and the Patent Right at Issue are separate rights. Moreover, in this action the plaintiff seeks compensation under Article 102(2) of the Patent Act for the profits obtained by the defendant through manufacturing and selling the Defendant's Products, treating those profits as damages. It does not seek compensation for the profits obtained by the defendant's customers as damages suffered by the plaintiff. Accordingly, the plaintiff cannot be found to be seeking

double recovery in Japan and Europe for the same Defendant's Products, and it is not appropriate to limit the plaintiff's claim in this action concerning the Defendant's Products destined for Europe. …

As examined above, all Defendant's Products manufactured in Japan and sold for foreign markets must be included within the scope of the damages sought in this claim.

The defendant also argues that the presumption of negligence under Article 103 of the Patent Act does not apply where grounds for invalidity appear to exist in the patent before correction. However, even if grounds for invalidity existed in the patent based on the claims before correction, it is possible that they would be overcome through a request for a correction trial or a request for correction in an invalidation trial, and this must be regarded as readily foreseeable. Accordingly, the presumption of negligence under Article 103 should require only foreseeability that one's conduct is an act of working falling within the technical scope of the patented invention. The mere existence of grounds for invalidity in the patent before correction cannot be understood to rebut the presumption of negligence under Article 103. …

Article 724 of the Civil Code establishes a time limit (extinctive prescription) for tort damages claims. In view of the fact that legal relationships arising from tort may occur between previously unknown parties based on unexpected circumstances, it provides a special rule for the starting point of extinctive prescription with the victim's exercise of a damages claim in mind. Thus, "the time when [the victim] comes to know of the damage and the perpetrator" in that Article should be understood to mean the time when the victim learns of these matters to an extent that makes a damages claim against the perpetrator practically possible, in circumstances permitting such a claim. The time when the victim comes to know of the damage should be understood as the time when the victim actually recognizes that damage has occurred. For a damages claim based on the tort of patent infringement, as in this case, even if the victim knows that the perpetrator is manufacturing and selling a product, the victim cannot actually recognize resulting damage or exercise a damages claim unless the victim actually recognizes, by comparing the product with its patented invention, that the product falls within its technical scope and that the perpetrator's conduct infringes the victim's patent right. Accordingly, "knowing of the damage and the perpetrator" should be understood to require actual recognition that the perpetrator's conduct infringes the victim's patent right. …

The defendant argues that … the Settlement at Issue licenses it to work the U.S. '125 Patented Invention, which concerns substantially the same technology as the Patented Invention at Issue; that this also permits manufacturing the Defendant's Products embodying the U.S. '125 Patented Invention in Japan for export to the United States; and that the Defendant's Products destined for the United States are therefore outside the scope of damages. … (However,) the Settlement at Issue expressly defines the scope of licensed patent and other rights as those listed in the Schedule at Issue, "patent rights concerning automatic quantitative weighing apparatuses granted by the date of this settlement," and "rights relating to pending patent applications concerning automatic quantitative weighing apparatuses published by the date of this settlement." Because the application for the Patent at Issue was published after the Settlement at Issue, the wording of the settlement terms clearly excludes the Patent Right at Issue from the license granted by that settlement. Furthermore, patent rights are separate rights arising in each country. Even where they concern substantially identical technology, it is entirely possible, and not at all unnatural, to grant a license under a patent in one country but not another according to each country's market conditions and so forth. In addition, the Schedule at Issue, which lists the rights licensed under the Settlement at Issue, classifies the licensed patent and other rights by country. It is therefore clear that the plaintiff and the defendant naturally proceeded on the premise that the Settlement at Issue would determine separately, for each country's patent rights, whether a license would be granted.

This would change the grounds for refusal in the trial decision at the litigation stage. Allowing such a change would deprive the appellant in the appeal against the examiner's refusal of an opportunity to defend itself in those appeal proceedings;

*Even if the primary cited document is the same, a new technical matter cannot be asserted in an action to rescind the trial decision.

(Excerpts from the judgment)

…The defendant's above argument amounts to asserting that the Amended Claimed Invention lacks novelty based on an invention relating to Technical Matter A that differs from the Cited Invention identified in the Trial Decision at Issue as the invention disclosed in Cited Document 1. It changes, at the stage of this litigation, the grounds for refusing the application stated in the Trial Decision at Issue. Allowing such a change in grounds for refusal would deprive the appellant of its opportunity to defend itself in the proceedings for an appeal against the examiner's refusal (Patent Act Articles 159(2) and 50). The argument itself should therefore not be permitted merely because the primary cited reference is the same. …

Tokyo District Court, 2019 (Wa) 31214, Vinylidene Chloride Resin Wrapping Film <Tanaka>

Original Ameblo publication: 2022-02-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12724415647.html

Tokyo District Court, 2019 (Wa) 31214, Vinylidene Chloride Resin Wrapping Film <Tanaka>

A case affirming inventive step by rejecting the obviousness of focusing on a “parameter,” and also finding the support requirement satisfied, where it was unclear whether satisfying the composition values would also satisfy the physical-property values. Infringement was also affirmed.

I have uploaded a commentary to the firm’s website!!

[Summary of This Judgment and Some Observations]

1. Claims (Claim 1)

(A, B, and D are “physical-property values”; the others are “composition values.” ⇒ The primary reference matches all the “composition values,” but its “physical-property values” are unknown.)

A. Having a tear strength in the TD direction (the width direction of the wrapping film) of 2–6 cN, and

B. a tensile modulus in the MD direction (the machine direction of the wrapping film) of 250–600 MPa,

C. a vinylidene chloride resin wrapping film,

D. having a low-temperature crystallization onset temperature of 40–60°C as measured by a temperature-modulated differential scanning calorimeter,

E. relative to a polyvinylidene chloride resin containing 72–93% vinylidene chloride repeating units,

F. containing 0.5–3% by weight of an epoxidized vegetable oil and 3–8% by weight of at least one compound selected from the group consisting of citric acid esters and dibasic acid esters, and

G. having a thickness of 6–18 μm,

H. the vinylidene chloride resin wrapping film.

2. Inventive Step of Parameter Inventions (Related Cases Are Presented Below)

*This judgment recognized inventive step by rejecting the obviousness of focusing on the parameter (= IP High Court, 2019 (Gyo-Ke) No. 10137, Celecoxib Composition <Otaka>).

*The court recognized critical significance, but it was not decisive (= IP High Court, 2020 (Gyo-Ke) No. 10043, Crosslinked Acrylic Resin Particles <Mori>).

*The court held that the evidence did not establish that the problem addressed by the Invention at Issue had been known.

(Excerpts from the judgment)

…The defendant argues that a “vinylidene chloride resin wrapping film” satisfying the composition values of the Invention at Issue necessarily also satisfies its physical-property values (constituent features A, B, and D). However, … because that relationship is not established for the Invention at Issue, Cited Invention 1-2 cannot be found necessarily to satisfy the physical-property values merely because it is a “vinylidene chloride resin wrapping film” satisfying the composition values of the Invention at Issue. Nor is there other evidence sufficient to establish this. … It cannot be said to lack novelty. …

Although Cited Reference 1-2 (Defendant’s Exhibit 12), the primary reference, describes “adhesiveness” and “cuttability” as performance characteristics of wrapping film, it does not describe the related physical

properties of “tear strength” or “tensile modulus,” nor does it suggest that setting numerical ranges for them is a problem to be solved. It is therefore difficult to say that a person skilled in the art reading Cited Reference 1-2 would have motivation to single out “tear strength” and “tensile modulus” from among various physical properties and apply Cited Reference 2. The above difference cannot be regarded as readily conceivable. …

The defendant argues that, even if there is a difference between the Invention at Issue and Cited Invention 1-2 relating to the physical-property value in constituent feature D of the Invention at Issue (a low-temperature crystallization onset temperature of 40–60°C), the numerical range for that property lacks critical significance and cannot support inventive step. However, according to the Specification at Issue, the Invention at Issue seeks to solve the problem of suppressing unwanted tearing by controlling the “low-temperature crystallization onset temperature,” which exceeded 60°C in conventional wrapping films, to “40–60°C” (it does not fall below 40°C), through adjustments to the film stretching environment, stretching ratio and speed, relaxation environment and ratio, storage environment of the original film roll, and so forth. Its effect is demonstrated by the Examples and Comparative Examples. … Accordingly, the numerical range for the physical-property value in constituent feature D cannot be said to lack critical significance. Moreover, neither Cited Reference 1-2 nor Cited Reference 2 describes “low-temperature crystallization onset temperature” or suggests that setting its numerical range is a problem to be solved. A person skilled in the art reading Cited Reference 1-2 (and Cited Reference 2) therefore cannot be said to have motivation to single out “low-temperature crystallization onset temperature” from among various physical properties, and the above difference cannot be regarded as readily conceivable. The defendant’s argument cannot be accepted. … Nor can the Invention at Issue be said to lack inventive step based on Cited Invention 1-2.

3. The Proper Relationship Between “Composition Values” and “Physical-Property Values” Under the Support Requirement

*This judgment also found the support requirement satisfied where it was unclear whether satisfying the “composition values” would satisfy the “physical-property values,” without requiring that a film defined by the “composition values” have a high probability of satisfying the “physical-property values” (the exact opposite of the IP High Court decision in 2016 (Gyo-Ke) No. 10189, Optical Glass <Tsuruoka>!!).

*In the IP High Court case 2016 (Gyo-Ke) No. 10189, Optical Glass <Tsuruoka>, the court held that “it is necessary that a person skilled in the art can recognize, from descriptions or suggestions in the detailed description of the invention or from common general technical knowledge at the filing date, that the optical glass defined by the composition requirements of the application can satisfy the physical-property requirements of the application with a high probability.” (*However, the outcome in Optical Glass favored the rights holder.)

*In the IP High Court case 2012 (Gyo-Ke) No. 10151, High-Strength, High-Ductility Steel Sheet for Containers <Shibata>, the question was likewise whether an “alloy,” limited only in its carbon weight percentage, would satisfy the numerical limitations specified in the claim even with compositions other than those described in the specification. The court found a violation of the support requirement.

(Excerpts from the judgment)

…The defendant argues that, if the relationship whereby a wrapping film satisfying the composition values of the Invention at Issue also satisfies its physical-property values is rejected, … the support requirement is not satisfied. … Considering this point, … the “Problem to Be Solved by the Invention” section of the Specification at Issue states that, with conventional vinylidene chloride resin wrapping films, lowering the tear strength to improve cuttability leads to frequent unwanted tearing, while increasing the tear strength to reduce such tearing worsens cuttability, and that achieving both suppression of unwanted tearing and improved cuttability was therefore a problem. … Furthermore, the “Means for Solving the Problem” section states that, as the means for solving that problem, the Invention at Issue adopts … a vinylidene

chloride resin wrapping film having physical-property values of a tear strength in the TD direction of 2–6 cN, a tensile modulus in the MD direction of 250–600 MPa, and a low-temperature crystallization onset temperature of 40–60°C measured by a temperature-modulated differential scanning calorimeter. … Thus, … the problem addressed by the Invention at Issue is to provide a vinylidene chloride resin wrapping film achieving both suppression of unwanted tearing and improved cuttability. As its means of solution, the Invention at Issue adopts a film satisfying the physical-property values in addition to the composition values. It can readily be recognized that this results in a vinylidene chloride resin wrapping film achieving both suppression of unwanted tearing and improved cuttability. …

On the foregoing basis, the Invention at Issue is described in the detailed description of the invention in the Specification at Issue and falls within the scope in which it can be recognized from that description that the problem can be solved. The Patent at Issue therefore cannot be said to have a ground for invalidity (Patent Act Article 123(1)(iv)) based on failure to satisfy the support requirement (Article 36(6)(i)).

4. Infringement of Parameter Inventions

*The plaintiff's measurement conditions and so forth were appropriate, while the defendant's measurement conditions were inappropriate. ⇒ Infringement.

*Where numerical measurements vary depending on the measurement conditions, if those conditions can be derived from the specification or from common general technical knowledge at the filing date, whether a product falls within the scope is determined by the results obtained under those conditions. One point to note for this category is that, where multiple measurement conditions were conventionally known and the specification does not uniquely identify the conditions, the technical scope of the invention is narrower when specific measurement conditions are not recited in the claim (the opposite of the usual intuition). This is because, without specific measurement conditions in the claim, infringement must be established under every one of the "conventionally known measurement conditions."

(Excerpts from the judgment)

…Regarding "tear strength in the TD direction" in constituent feature A of the Invention at Issue, the defendant argues that the method for measurement using a "light-load tear tester (manufactured by Toyo Seiki)" in accordance with "JIS P 8116" is unclear, and that measurements made through a third-party organization in accordance with "JIS P 8116" produced a result of approximately 7 cN. However, … according to paragraph [0057] of the Specification at Issue, a person skilled in the art can understand how to measure the "tear strength in the TD direction" of wrapping film using a "light-load tear tester (manufactured by Toyo Seiki)." The "Test Method" field of the test certificate … prepared by Kaken Test Center, a general incorporated foundation, and submitted by the defendant states "JIS P 8116 applied mutatis mutandis," and the number of superimposed test specimens was 16. It is therefore considered that the measurement used an "Elmendorf-type tear tester" … described in "JIS P 8116" … rather than the "light-load tear tester (manufactured by Toyo Seiki)" … specified in the Specification at Issue. … The measurement method itself thus differs from the method that can be understood from the Specification at Issue. …

[Related Cases: Inventive Step of Parameter Inventions]

Regarding inventive step of numerical-limitation inventions and parameter inventions, the JPO Examination Guidelines present an approach that recognizes inventive step where there is an unpredictable advantageous effect that is either "different in kind" from that of the cited invention or "of the same kind but remarkable," and denies inventive step for inventions lacking such effects.

Looking back at past cases, until around 2010 there were a certain number of judgments, like the JPO Examination Guidelines, determining inventive step of numerical-limitation inventions and parameter inventions according to whether the invention had an "effect different in kind" or an "effect of the same

kind but remarkable." Under that test, the rights holder must allege and prove the effects and thus bears the burden of proof.

However, looking at more recent cases, the Pharmaceutically Stable Formulation of Oxaliplatinum case <Iimura> (Intellectual Property High Court, January 31, 2011, see the courts' website, 2010 (Gyo-Ke) No. 10122) held: "Generally, in determining whether an invention could readily have been conceived, it is reasonable to reach a conclusion by comparing the invention with a particular prior invention, identifying the features that differ, and examining whether, given the state of the art at the filing date, a person skilled in the art could readily have arrived at the features of the invention relating to those differences. … This approach does not differ at all even where the features relating to the differences include features limited by a numerical range. Needless to say, the invention's technical significance, the nature of the problem solving, its effects, and so forth must be considered comprehensively, including the features relating to other differences." From around that time, the overwhelming majority of judgments have differed from the JPO Examination Guidelines: they regard the parameters or numerical values as invention-defining matters and assess whether setting those parameters or values and their ranges would have been obvious, recognizing inventive step if it would not. As with ordinary inventive-step analysis, this framework places on the party denying inventive step the burden of alleging and proving the obviousness of setting the parameter or numerical value and its range. Once a new parameter or numerical value is set, proving obviousness is often difficult, except where it can be uniquely converted to an existing one (in which case it is difficult to call it new). Many judgments have therefore been unable to deny inventive step conclusively.

That is, (1) where the parameter or numerical value itself is new and motivation to focus on it cannot be demonstrated, the mainstream in recent case law is to reject the obviousness of the invention-defining matter and affirm inventive step. In contrast, (2) turning to cases where the parameter or numerical value itself was found to have been known or capable of attracting attention, even recent case law contains many instances in which its range was held obvious and inventive step was denied (on grounds such as that it was a matter of design choice or that combination with a secondary cited invention disclosing the parameter or numerical value was obvious).

Accordingly, (1) the decisive issue in assessing inventive step for an invention whose scope is defined by a new "numerical value" or "parameter" is whether a person skilled in the art at the filing date could readily have focused on that value or parameter. This is consistent with the general reasoning for denying inventive step of a parameter invention stated in the Stretch Wrapping Film case discussed below (Intellectual Property High Court, September 26, 2005, see the courts' website, 2005 (Gyo-Ke) No. 10222): "There must be motivation to focus on the parameter, and specific means for achieving Requirements B and C must be known to a person skilled in the art." Also instructive are the Film-Like Adhesive for Circuit Connection and Circuit Board case below (Intellectual Property High Court, April 12, 2005, see the courts' website, 2005 (Gyo-Ke) No. 10091), which relied on the upper and lower limits of the numerical range each solving a particular problem as grounds for affirming inventive step, and the Run-Flat Tire case below <Takabe> (Intellectual Property High Court, December 21, 2017, see the courts' website, 2017 (Gyo-Ke) No. 10058), which denied inventive step through the following reasoning: (1) the parameter could have attracted attention ⇒ (2) there was motivation to combine the primary and secondary references ⇒ (3) the numerical values had no remarkable effect ⇒ (4) the numerical range was a matter of design choice. Beyond these, my analysis of all the cases leads me to believe the key phrase is "the problem addressed by the invention." If it can be demonstrated that a person skilled in the art at the priority date knew of, or could have focused on, the problem addressed by the invention, it may be possible to reason that focusing on the "numerical value" or "parameter" from that problem was also obvious. Conversely, if a person skilled in the art at the priority date could not have focused on the problem addressed by the invention, it is difficult to establish that focusing on the new "numerical value" or "parameter" was obvious, making inventive step more likely to be affirmed.

(2) Even where the parameter or numerical value itself was found to have been known or capable of attracting attention, if the problem addressed by the invention was known or could have attracted attention, the range of that “numerical value” or “parameter” is more likely to be regarded as a matter of design choice. If a secondary reference discloses that “numerical value” or “parameter,” combining it with the primary reference is more likely to be held obvious.

These observations are not peculiar to numerical-limitation inventions and parameter inventions; rather, they align with recent case-law trends for inventions generally. When assessing whether combining primary and secondary references is obvious, recent judgments give considerable weight not only to the commonality of problems between those references, as indicated by the JPO Examination Guidelines, but also to the commonality of problems between the invention at issue and the primary reference. Where those problems differ, courts tend to affirm inventive step on the basis that arriving at the invention at issue from the primary reference would not have been obvious.

⇒ When assessing whether combining primary and secondary references is obvious, recent judgments give considerable weight not only to the commonality of problems between those references, as indicated by the JPO Examination Guidelines, but also to the commonality of problems between the invention at issue and the primary reference. Where those problems differ, courts tend to affirm inventive step on the basis that arriving at the invention at issue from the primary reference would not have been obvious.

For numerical-limitation inventions and parameter inventions as well, insofar as the “numerical value” or “parameter” is treated as an invention-defining matter and its obviousness is assessed, the question, as with ordinary inventions, is whether arriving at that value or parameter from the primary reference would have been obvious. In that assessment, considerable weight tends to be given to the commonality of problems between the invention at issue and the primary reference. Together with the recent judicial tendency to regard “numerical values” or “parameters” as invention-defining matters, this has brought the problem addressed by the invention into focus for numerical-limitation inventions and parameter inventions as well.

Finally, I consider the relationship between the framework in the JPO Examination Guidelines and that in recent case law, and which is more likely to result in an affirmative finding of inventive step. For a rigorous analysis, first consider the relationship between an invention’s “problem” and “effect.” Even if “whether a problem to be solved and a means of solving it have been presented is inseparably related to the nature of the ‘effect of the invention,’” the two do not correspond one to one. If solving any of Problems A, B, or C produces Effect α, there are three possible problems whose solution can produce Effect α. Thus, if the inquiry is whether the “effect” differs in kind, as in the JPO Examination Guidelines, inventive step may be denied because the effect does not differ in kind from that of a reference solving a problem (for example, Problem B or C) different from the invention’s problem (for example, Problem A). Under the framework in recent case law, however, even in such a situation inventive step may still be affirmed on the basis that focusing on the “numerical value” or “parameter” to solve new Problem A, which differs from the problem addressed by the cited invention, was not obvious. First, therefore, in terms of the relationship between the invention’s “problem” and “effect,” the latter framework (recent case law) appears to permit a broader range of affirmative inventive-step findings. (However, where the “effect” differs, the invention’s “problem” often differs too.)

Continuing this analysis, where an “effect different in kind” is recognized under the JPO Examination Guidelines’ framework, the corresponding relationship is that the parameter or numerical value is new and focusing on it is not obvious. Where an “effect of the same kind but remarkable” is recognized, the corresponding relationship is that the range is not obvious even if the parameter or numerical value is publicly known. Accordingly, when an “effect different in kind” or an “effect of the same kind but remarkable” is recognized, both frameworks reject obviousness of the parameter/numerical invention and affirm inventive step. Conversely, where neither type of effect is recognized, the JPO Examination Guidelines’ framework immediately yields a negative inventive-step finding. Under the framework in

recent case law, however, inventive step is affirmed unless, in light of the problem addressed by the invention, both focusing on the “numerical value” or “parameter” and defining its range would have been obvious. Inventive step is therefore easier to establish under the recent case-law framework. In fact, in reviewing and analyzing all the cases, I have found that this judicial tendency is reflected in the many judgments since 2008 rescinding trial decisions that had denied inventive step. This also supports the foregoing analysis.

The converse of these observations is that, in constructing an argument against inventive step of a parameter or numerical value under the recent case-law framework, one should focus first on (1) proving that “the parameter or numerical value itself was known,” or first proving that the problem addressed by the invention was known and then using this as a foothold to prove that “a person skilled in the art at the priority date could have focused on the parameter or numerical value itself.” Next comes (2) a second stage, again using the problem addressed by the invention as a foothold, attempting to establish that the range of the parameter or numerical value was a matter of design choice or was disclosed in a secondary reference that could readily be combined, and so on. Thus, two stages of reasoning are required (three if proof that the problem addressed by the invention was known is counted separately).

Below, among the cases treating parameters or numerical values as invention-defining matters, I introduce those affirming inventive step (finding non-obviousness), followed by those denying inventive step (finding obviousness). Comparing the two sets of cases reveals the reasoning and argument strategy described above for denying inventive step of numerical-limitation inventions and parameter inventions.

I Have Uploaded an Article Introducing the LINE Furufuru (“Shake It”) Lawsuit to the Firm’s Website. Tokyo District Court, 2017 (Wa) 36506 <Sato>

Original Ameblo publication: 2022-02-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12724873890.html

I have uploaded an article introducing the LINE Furufuru (“Shake It”) lawsuit to the firm’s website.

2017 (Wa) 36506 <Sato>

(1) A case in which the logic of extracting only the “GPS search function” from a secondary reference and applying it to the primary reference was rejected, and inventive step was recognized because there was a teaching away from that application.

(2) A case holding that the defendant’s services for which infringement had not been argued were outside the scope of damages, and that sales having “at most a tenuous relationship” lacked an adequate causal relationship and were outside the scope of damages under paragraph (3).

[Summary of This Judgment and Some Observations]

1. Claims (Claim 1)

A. A computer system that supports interaction through communication over a network using a computer, by users who have met in the real world operating user terminals,

B. comprising contact-list display control means for controlling the display to a user of a list of multiple contacts so that users who have mutually agreed to interact through communication can interact;

C. input-content notification means for notifying, at said user terminals, content entered by a user and a selected other user through operation of their user terminals, so that, when the user selects and designates a person with whom the user wishes to communicate from among the multiple contacts displayed by said contact-list display control means, the selecting user and the selected other user can convey their entered content to each other and send and receive messages;

D. search means for obtaining location information of said user terminals and, based on that information, searching for user terminals located within a predetermined distance during a predetermined time;

E. and contact-addition means for performing a contact-addition process that adds a terminal as a new contact to said contact list to enable sending and receiving said messages with the terminal found by the search, on the necessary condition that said search means has found a user terminal located within said predetermined distance during said predetermined time;

F. wherein, when a person who has selected and designated a person with whom to communicate from among said multiple contacts performs an operation of entering and sending a message to the selected person, control is executed to provide, at the selected person’s user terminal, a pop-up notification that a message has been entered, while

G. in response to a request from one of the user terminals designated as said contacts and capable of sending and receiving messages with each other, control is performed so that said pop-up notification is not given even if an operation of entering and sending a message is performed from the other user terminal;

H. and wherein said contact list is displayed on said user terminal based on control from said computer, thereby enabling said users to interact without disclosing personal contact information to each other;

I. the computer system.

2. Excerpts from the Judgment (1): The Inventive-Step Analysis

(1) Differences from the Primary Cited Invention (Exhibit Otsu 5)

"(b) Difference 2

The Inventions at Issue comprise so-called GPS search means for obtaining the location information of user terminals and searching, based on that information, for user terminals located within a predetermined distance during a predetermined time, whereas the Exhibit Otsu 5 Invention does not comprise such search means.

(c) Difference 3

The Inventions at Issue obtain location information of user terminals and perform a contact-addition process to add a contact to the contact list on the necessary condition that, based on that location information, a user terminal located within a predetermined distance during a predetermined time has been found. By contrast, the Exhibit Otsu 5 Invention adds other-party IDs to a list based on short-range wireless communication between the users' encounter-support devices 11."

(2) Assessment of the Obviousness of Differences 2 and 3

"Difference 2 … and Difference 3 … concern the following distinction: the Inventions at Issue use GPS search means to obtain location information of user terminals and perform a contact-addition process to add a contact to the contact list on the necessary condition that a user terminal located within a predetermined distance during a predetermined time has been found based on that information, whereas the Exhibit Otsu 5 Invention adds other-party IDs to a list based on short-range wireless communication between the users' encounter-support devices 11.

On this point, the defendant argues that, as described in Publications Otsu 42 through 45, means for detecting the distance between user terminals in encounter-support systems using such terminals are known to include wireless radio communication between terminals and GPS searches; that it is common general technical knowledge that a person skilled in the art appropriately selects between these; and that Publication Otsu 5 not only permits methods other than transmitted and received radio waves for detecting proximity between users but also contemplates integration with a PDA having GPS functionality. The defendant therefore argues that a person skilled in the art could readily have conceived of configuring the Exhibit Otsu 5 Invention to detect proximity using GPS search means.

(a) Considering this issue, the technologies disclosed in Publications Otsu 43 through 45 cited by the defendant all presuppose disclosure to the other party of personal information such as name, address, telephone number, and email address. There is therefore a teaching away from applying those technologies to the Exhibit Otsu 5 Invention, whose purpose is 'to improve the likelihood of encounters between users, particularly between men and women, with matching hobbies and preferences, without the other party learning important personal information in the initial stages of an encounter.' Moreover, in light of the fact that Exhibit Otsu 42 was published three months before the priority date of the Patent at Issue (February 15, 2010), on December 17, 2009 [sic], the technology disclosed in that publication cannot be recognized as well known at the priority date of the patent application at issue.

(b) Next, we consider the defendant's argument that Publication Otsu 5 not only permits methods other than transmitted and received radio waves for detecting proximity between users but also contemplates integration with a PDA having GPS functionality.

It is true that paragraph [0063] of Publication Otsu 5 states that an encounter-support device may detect proximity using infrared rays or a combination of infrared rays and radio waves. However, that infrared communication also detects proximity through direct communication between encounter-support devices.

By contrast, using GPS functionality in the Exhibit Otsu 5 Invention would require a more complex system in which each encounter-support device obtains location information and the like by GPS, while a server or

the like separately determines proximity based on that information and transmits the result to each device (see Exhibits Otsu 27, 28, and 55). It is difficult to identify any particular reason to adopt such a cumbersome configuration. Thus, the existence of the above disclosure does not make it easy to replace the short-range wireless communication technology of the Exhibit Otsu 5 Invention with a method using GPS functionality.

Furthermore, paragraph [0065] of Publication Otsu 5 states that a PDA or the like may be substituted for the PC terminal. In the Exhibit Otsu 5 Invention, however, it is encounter-support device 11, not PC terminal 102, that determines proximity and so forth between users. Even if GPS was well known as one function of a PDA, it is difficult to find that a person skilled in the art would readily have conceived of replacing the proximity determination and so forth performed by encounter-support device 11 with a method using GPS functionality.

(c) Accordingly, a person skilled in the art cannot be found readily to have conceived of the features relating to Differences 2 and 3 by applying the technologies disclosed in Publications Otsu 42 through 45 to the Exhibit Otsu 5 Invention."

3. Excerpts from the Judgment (2): The "Sales Revenue" Portion of the Damages Analysis

"(1) Sales Revenue

(a) The parties' arguments

The plaintiff argues that, among the defendant's businesses, the businesses subject to the Patent Right infringement at issue are … sales from 'account advertising' and 'communication' within its core business.

The defendant, in contrast, argues that account-advertising sales, which mainly come from companies and others holding accounts on the Defendant's App, are not included in the damages calculation, and that even if communication sales can be included, only the portion related to the Function at Issue should be covered.

(b) Findings of fact

Considering this matter, the underlying facts set out above, the evidence cited below, and the entire purport of oral argument establish the following facts.

(i) The defendant's businesses and sales revenue (…) …

a. Nature of account-advertising sales and related matters

Account-advertising sales comprise sales from (1) official accounts, (2) Business Connect, (3) LINE@, (4) sponsored stickers, (5) sales promotions, (6) advertisements, (7) ●(omitted)●, (8) ●(omitted)●, and (9) limited-edition stickers.

Items (1) through (3) are services through which companies and others can open accounts and send messages and the like to users who have added those accounts as friends. The defendant earns revenue from monthly and other fees paid by companies and others using paid plans.

Item (4) is a service allowing companies and others to provide users with their own original stickers free of charge for advertising and promotional purposes. Companies must pay a fixed amount to use it, generating revenue for the defendant.

Item (5) comprises services allowing campaigns through the Defendant's App and services through which users receive 'LINE Points' free of charge only if they satisfy certain conditions (missions). Companies and others must pay fees corresponding to the campaign content and so forth, generating revenue for the defendant.

Item (6) consists of advertisements placed by companies and others in the Defendant's App, generating advertising-fee revenue for the defendant.

Item (7): ●(omitted)●

Item (8): ●(omitted)●

Item (9) involves the defendant receiving payment from companies and others when it sells stickers through them.

b. Nature of communication sales and related matters

Communication sales comprise sales from (a) LINE Stickers, (b) LINE Themes, (c) LINE Emoji, (d) Creators' Stickers, (e) Creators' Themes, (f) Creators' Emoji, (g) LINE Stickers Premium, and (h) LINE Out.

Stickers ((a), (d), and (g)) are illustrations that can be sent in chats between users and purchased from the Sticker Shop within the Defendant's Service.

Themes ((b) and (e)) change the background of a user's own Defendant's App and can be purchased from the Theme Shop within the Defendant's Service.

Emoji ((c) and (f)) can be inserted into text messages in chats between users and purchased from the Sticker Shop within the Defendant's Service. Also, tapping or otherwise selecting a sticker or emoji used by another person (a friend or the like) in a chat room takes the user to the Sticker Shop selling that sticker. Users can therefore visit the Sticker Shop and purchase the sticker or emoji in that way as well.

When users purchase stickers, themes, and emoji ((a) through (g)), the purchases generate revenue for the defendant.

Item (h) is a service allowing users to make paid voice calls using telephone lines, and use of it generates revenue for the defendant. Users of the Defendant's App can, however, make free calls to each other within the app using an internet connection, so there is no need for them to use paid service (h).

(ii) Means of adding friends (Exhibits Otsu 81 and 101)

●(omitted)●

(iii) Adding corporate and other accounts as friends through 'Shake It' (Drawings of the Defendant's System and Other Products, Figure 38; Exhibit Ko 61)

Where companies and others using services such as LINE@ have registered location information for their addresses in advance, an ordinary user who selects 'Shake It' on the add-friends screen of the Defendant's App and shakes the smartphone in hand is also shown those companies and others within a 1 km radius as candidates to add as friends. If the user performs the add-friend process for such a company or other entity, it is additionally registered as that user's friend.

(c) Sales and other matters relating to adding friends by methods other than 'Shake It' and exports to overseas companies

The plaintiff argues that damages should not be limited to adding friends through 'Shake It' and interacting with users who became friends that way, but should also include other methods of adding friends, such as QR codes and ID searches, and should cover consolidated sales including overseas companies.

(i) However, from the outset of this action, the plaintiff consistently argued that adding friends through 'Shake It' and subsequent interaction fall within the technical scope of the Inventions at Issue (…). Allegations and proof that adding friends by other means and related acts fall within that scope were not included in the infringement phase. Thus, the sales revenue covered by damages must be limited to the scope having an adequate causal relationship with adding friends through 'Shake It.'

(ii) Furthermore, the argument that consolidated sales including overseas companies should be covered is understood to seek inclusion of sales from the defendant's exports of products embodying the inventions to overseas companies. However, the defendant's acts of working targeted by the plaintiff in the infringement phase were limited to use of the Defendant's System and production, transfer, and offers for transfer of the Defendant's App. Even if the Defendant's System and Other Products are exported, the evidence in this

case does not establish whether those products include the Function at Issue. The plaintiff's argument on this point is therefore also difficult to accept.

(d) Scope of sales revenue covered by damages

We therefore consider … the scope of sales revenue covered by damages in this case.

(i) Account-advertising sales

Account-advertising sales concern revenue from companies and others. Although ordinary users can add such companies and others as friends through 'Shake It,' in that case the companies and others must have registered location information for their addresses in advance, and it is difficult to envisage them operating smartphones at the time. Accordingly, it is difficult in the first place to find that this case meets 'interaction through communication using computer (14), through nearby users operating smartphones (2) to add each other as friends' (feature a and so forth). There is no other adequate allegation or proof that the Defendant's System and Other Products in this case fall within the technical scope of the Inventions at Issue.

Moreover, … considering the nature of the respective categories comprising account-advertising sales, they must all be regarded as having either no relationship or, at most, a tenuous relationship with ordinary users adding each other as friends through the Function at Issue.

Thus, it is appropriate to conclude that account-advertising sales are not covered by damages in this case.

(ii) Communication sales

a. Among communication sales, themes (items (b) and (e) in (b)(i)b above) change the background of a user's own Defendant's App and must therefore be regarded as having either no relationship or, at most, a tenuous relationship with adding friends through the Function at Issue and subsequent interaction.

Furthermore, given that users of the Defendant's App can make free calls to one another within the app, it can be inferred that LINE Out ((h) above) is ordinarily used when a user of the Defendant's App calls someone who is not a user. It likewise must be regarded as having either no relationship or, at most, a tenuous relationship with adding friends through the Function at Issue and subsequent interaction.

By contrast, stickers ((a), (d), and (g) above) and emoji ((c) and (f) above) are used, for example by being sent to one another, when users registered as friends communicate in chat rooms. They can therefore be said to be used in connection with adding friends through 'Shake It' and subsequent interaction, and their sales revenue is related to the defendant's infringing conduct. … Sales revenue for stickers and emoji during the Damages Calculation Period at Issue (sales of stickers and emoji in the Sticker Shop) is found to be ●(omitted)●. …

4. Some Observations

(1) The Inventive-Step Analysis

The issue was whether, in the primary reference (Exhibit Otsu 5), it would have been obvious to "use GPS search means to obtain location information of user terminals and perform a contact-addition process to add a contact to the contact list on the necessary condition that a user terminal located within a predetermined distance during a predetermined time has been found based on that information."

Because the secondary references (Exhibits Otsu 42 through 45) disclosed means for detecting the distance between user terminals using GPS searches, the defendant (LINE) argued that it would have been obvious to perform the "contact-addition process to add a contact to the contact list" "using GPS search means" instead of the short-range wireless communication in the primary reference (Exhibit Otsu 5).

However, this judgment found a teaching away because the purpose and problem of the primary cited invention (Exhibit Otsu 5) are "to improve the likelihood of encounters between users, particularly between men and women, with matching hobbies and preferences, without the other party learning important personal information in the initial stages of an encounter," whereas the secondary references "presuppose

disclosure to the other party of personal information such as name, address, telephone number, and email address." This analysis does not directly take up and assess the logic of omitting the personal-information notification features of the secondary references (Exhibits Otsu 42 through 45), extracting only the technology of "detecting the distance between user terminals using GPS searches" as a secondary cited invention (or well-known technology), and then combining that extracted secondary cited invention (or well-known technology) with the primary reference (Exhibit Otsu 5). It would have been interesting to see how the appellate court assessed this point, but I understand that a settlement was reached before the appellate judgment.

Below, I organize cases in which part of a cited invention's configuration could, or could not, be extracted.

(2) The "Sales Revenue" Analysis in the Damages Phase

As a general principle, the presumption in Article 102(3) of the Patent Act extends only to the "amount" of damages; the patentee bears the burden of alleging and proving the existence of damage.

Moreover, the "amount of money that should be received for the working of the patented invention" is calculated as "sales revenue" related to working the patented invention × "reasonable royalty rate." This judgment held that "sales revenue" under paragraph (3) is "limited to the scope of sales revenue having an adequate causal relationship" with working the patented invention (adding friends through 'Shake It'), and then determined that scope separately for each of the defendant's services.

There were broadly two issues in this case, both decided in the defendant's favor.

(2-1) First, the plaintiff argued that damages should not be limited to adding friends through 'Shake It' and interacting with users who became friends that way, but should also include other methods of adding friends, such as QR codes and ID searches, and should cover consolidated sales including overseas companies. However, the judgment found that "from the outset of this action, the plaintiff consistently argued that adding friends through 'Shake It' and subsequent interaction fall within the technical scope of the Inventions at Issue," and held that "adding friends by other means and related acts" were not covered by damages because infringement had not been argued for them.

On this point, for example, where there are ten types of accused products, it is often the case that infringement is argued for one representative type and the conclusion also extends to the other nine. Naturally, however, if the other nine present non-infringement arguments different from those concerning the representative type, the conclusion does not extend to them. This case falls into the latter category. Even if the scope of accused products was narrowed through case management in the infringement phase, one must also consider the scope of the damages claim. Where it is disputed whether the result of the infringement proceedings concerning the representative product extends to the other accused products, it is necessary to insist on separate infringement arguments for each accused product.

(2-2) Second, account-advertising sales and LINE Out sales within communication sales were held outside the scope of damages as revenues not falling within "the scope having an adequate causal relationship with adding friends through 'Shake It.'" (As to account-advertising sales, the judgment also points out that infringement had not been sufficiently argued, but in a separate paragraph from that context it states, as with LINE Out, that there is "either no relationship or, at most, a tenuous relationship.")

The judgment uses the expression "either no relationship or, at most, a tenuous relationship." In particular, exploring the boundary at which a relationship is deemed "at most tenuous" (so that an "adequate causal relationship" is denied and damages are unavailable) will be extremely important in future patent practice. It would also have been interesting to see how the appellate court assessed this point, but I understand that a settlement was reached before the appellate judgment.

[Cases in Which the Issue Was Whether Part of a Cited Invention's Configuration Could Be Extracted]

In identifying a cited invention, a cohesive set of features and a technical concept contained in it can be extracted.

1. Cases Favorable to the Rights Holder

*Cases in which part of the features of a secondary cited invention could not be independently extracted

(1) IP High Court, 2019 (Gyo-Ke) No. 10102, Vertical Shaft Construction Machine <Takabe>

(Excerpt from the judgment) Identifying from Cited Reference 3 the invention described in Section 3.2 [Plaintiffs' Arguments] (1) above would focus only on part of the slewing bearing. Because that part alone would not allow the slewing bearing to function as an integrated whole, it is inappropriate to identify an invention from Cited Reference 3 in the manner argued by the plaintiffs.

(2) IP High Court, 2015 (Gyo-Ke) No. 10077, Flush Toilet <Shimizu>

(Excerpt from the judgment) In the technical field of flush toilets, the number of flush-water outlets, the structure of the water passage, the flush-water supply path, and the flow path constitute a series of technical matters. Focusing on only one aspect of such a series of technologies and extracting part of a cohesive set of technical matters is itself an act of creating a technical concept. Simplistic abstraction or generalization to a higher-level concept is therefore impermissible; careful examination corresponding to the technical matters is required. … Flush-toilet washing involves various forms of flush-water supply, numbers of outlets, and shapes of water passages and flow paths. Without considering these differences in flushing methods, it is inappropriate to recognize the provision of a horizontal water passage guiding flush water to the upper edge of a bowl surface as well-known technology regardless of the number of outlets or the flush-water flow path, which necessarily differs accordingly. At least, whether such well-known technology can be recognized should be assessed on the premise of a flush-toilet washing method having a single outlet supplying flush water horizontally and a unidirectional flow path, as in the Corrected Invention at Issue and the Exhibit Ko 1 Invention.

(3) IP High Court, 2017 (Gyo-Ke) Nos. 10119 and 10120, Pneumatic Tire <Takabe>

= IP High Court, 2009 (Gyo-Ke) 10242; = IP High Court, 2016 (Gyo-Ke) 10226

(Excerpt from the judgment) The technical matters in (b)(1) through (3) above are inseparable as features for solving the problem described in Exhibit Ko 4. The natural understanding is that all those features together solve the problem of the invention described in Exhibit Ko 4: providing a pneumatic radial tire for passenger cars with improved wear resistance as well as improved dry-road performance, wet-road performance, and ride comfort. Accordingly, it is not possible to disregard the fact that Exhibit Ko 4 Technology A presupposes a block pattern and further extract only the technical matter relating to the groove-area ratio, thereby finding that Exhibit Ko 4 discloses the Exhibit Ko 4 Technology.

(4) IP High Court, 2011 (Gyo-Ke) No. 10284, Open-Type Fermentation Treatment Apparatus

(Excerpt from the judgment) …In the Cited Invention, the configuration of the agitator and the travel path are functionally linked. …

(5) IP High Court, 2011 (Gyo-Ke) No. 10385, Heat-Treatment Furnace with an Internal Heater <Shibata>

= IP High Court, 2015 (Gyo-Ke) 10077

(Excerpt from the judgment) The characteristic feature of the Cited Invention is the configuration with fan 28 inside the furnace to solve the problems of the conventional firing furnace shown in Figures 3 and 4. Identifying the Cited Invention as if that characteristic were absent would mean identifying an invention while disregarding the technically most important part of the elements constituting the cohesive technical concept disclosed in the cited reference, and must be deemed impermissible. In the Cited Invention, fan 28, driven by a drive motor located outside the furnace body and supported by one furnace wall, forcibly

agitates the atmosphere gas heated by the heater to make the furnace temperature uniform. It is therefore reasonable for heater 33 to be located between fan 28 and the stack of saggers 22 containing the objects to be fired, and a configuration in which heating elements are arranged in parallel along the furnace sidewall cannot be contemplated.

(6) IP High Court, 2011 (Gyo-Ke) No. 10100, High-Tensile-Strength Galvannealed Steel Sheet

(Excerpt from the judgment) …Table 1 of the cited reference illustrates five separate steels, giving the contents of the elements contained in Steels 1 through 5. For alloys, a difference in the content or the like of even one constituent normally changes the overall properties of each alloy, and the entire combination of alloying elements in predetermined amounts is technically evaluated as an integrated whole. … Even considering all the evidence in this case, it cannot be found that "each element constituting an alloy always has an inherent action unaffected by other elements," or, in other words, that "the content and so forth of each element independently has a particular technical significance."

2. Cases Unfavorable to the Rights Holder

*Cases in which part of the features of a cited invention could be independently extracted

(1) IP High Court, 2006 (Gyo-Ke) No. 10499, Wireless Door-Lock Control Device <Shinohara>

(Excerpt from the judgment) Cited Reference 2 does not describe only a single technology; … it describes various inventions. From among them, it is possible to identify the publicly known technology of Cited Invention 2A, or to identify publicly known technology that includes Incidental Matters (1) and (2). The former is clearly a broader concept encompassing the latter, but the usual approach in identifying and assessing inventive step in comparison with publicly known technology is to select the technology closest to the Invention at Issue. … Where a switch is exposed, unintended contact and the like can cause accidental operation, which is clear from experience. In a structure that locks and unlocks using an exposed switch, a person skilled in the art would naturally recognize, and should be aware of, the common general technical knowledge that unintended accidental operation of the switch may release the lock. Accordingly, focusing on and selecting Cited Invention 2A from Cited Reference 2 is extremely easy for a person skilled in the art.

(2) IP High Court, 2010 (Gyo-Ke) No. 10220, Portable Household Generator

Cf. IP High Court, 2010 (Gyo-Ke) 10162;

= IP High Court, 2005 (Gyo-Ke) 10105, Microwave Rice Cooker

(Excerpt from the judgment) Admittedly, the Cited Invention is one configuration for solar power generation and charging in the "portable fan" described in the cited reference, and can be said primarily to serve the operation of that fan. However, the disclosed structure and mechanism for solar power generation and charging are not directly related to operating the fan. They are technically independent in themselves and can be discussed separately from the operation of the fan. … Accordingly, a person skilled in the art reading those disclosures in the cited reference can, considering its disclosures as a whole, identify the Cited Invention—a solar cell capable of multipurpose use—as an independent technical concept. …

(3) IP High Court, 2010 (Gyo-Ke) No. 10160, Dicing/Die-Bonding Tape and Method for Manufacturing Semiconductor Chips

Cf. IP High Court, 2010 (Gyo-Ke) 10162;

(Excerpt from the judgment) In Cited Invention 2, … the function of permitting easy peeling performed by adhesive layer (2a) is achieved through the coexistence of a function independent of adhesive layer (2b). It is therefore not affected by the presence of adhesive layer (2b), but is performed independently by adhesive layer (2a) alone. Thus, … a person skilled in the art can recognize adhesive layer (2a), with relatively weak adhesive strength, and adhesive layer (2b), with relatively strong adhesive strength, in Cited Invention 2 as separate features, and can recognize their respective technical significance individually. Accordingly,

adhesive layer (2a) can be independently extracted as a layer having relatively weak adhesive strength by focusing on its easy-peeling property when chip-shaped workpieces are peeled from the adhesive layer.

(4) Tokyo High Court, 2004 (Gyo-Ke) No. 159, Housing Case for a Control Circuit Board in a Gaming Machine

(Excerpt from the judgment) The Decision at Issue cited Publications 2 and 3 to establish that, at the filing date of the Patent at Issue, it was well known, in housing cases for gaming-machine control circuit boards, to provide projecting board-fixing pins on the bottom plate of the housing case and to secure the control circuit board to that bottom plate with those pins. In light of Publications 2 and 3 and common general technical knowledge, it is clear that the technology of fixing a control circuit board to the bottom plate of its housing case is technically unrelated to the technology of providing electrostatic (electromagnetic-wave) countermeasures for the housing case. Applying the above technical matters in Publications 2 and 3 to the Publication 1 Invention therefore raises no issue of adverse effects on electrostatic countermeasures. …

(5) IP High Court, 2005 (Gyo-Ke) No. 10672, High-Frequency Bolt Heater

(Excerpt from the judgment) …In identifying a cited invention, a cohesive set of features and a technical concept contained in it may be extracted, and there is no reason to regard that process as limited to the particular embodiments described in the cited publication. … The specific configuration for high-frequency induction heating itself, which Exhibit Ko 1 does not describe in an implementable manner, … was common general technical knowledge … at the filing date of the Patent at Issue. Thus, a person skilled in the art could have understood the Exhibit Ko 1 Invention as capable of implementing high-frequency induction heating by considering the specific configuration of the induction heating body that was such common general technical knowledge in relation to high-frequency induction heating by the "…high-frequency heating torch" of Exhibit Ko 1.

Plaintiff (patentee): Future Eye Co., Ltd.

Defendant (alleged infringer): LINE Corporation

[Patent ★★] Action for Damages and Other Relief ((1) A case in which the logic of extracting only the "GPS search function" from a secondary reference and applying it to the primary reference was rejected, and inventive step was recognized because there was a teaching away from that application. (2) A case holding that the defendant's services for which infringement had not been argued were outside the scope of damages, and that sales having "at most a tenuous relationship" lacked an adequate causal relationship and were outside the scope of damages under paragraph (3).) — 2017 (Wa) No. 36506, Computer System (LINE Furufuru ("Shake It") Case) <Presiding Judge Sato> — NAKAMURA & PARTNERS— 2017 (Wa) No. 36506, Computer System (LINE Furufuru ("Shake It") Case) <Presiding Judge Sato> — ◆ Full text of the judgmentwww.nakapat.gr.jp

IP High Court, 2008 (Ne) 10061, Refrigeration System and Condensing Heat Exchanger <Nakano> — Jurisdiction over Patent Cases

Original Ameblo publication: 2022-02-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12724970735.html

IP High Court, 2008 (Ne) 10061, Refrigeration System and Condensing Heat Exchanger <Nakano>

“Actions relating to patent rights” broadly encompass litigation connected with patent rights … and are not limited to actions seeking injunctions or damages for patent infringement or payment of compensation for employee inventions. They also include litigation concerning agreements establishing exclusive or non-exclusive patent licenses, as in this case.

⇒ The original judgment (Saitama District Court, 2007 (Wa) 1020) was rendered without jurisdiction.

*Commentary in Hanrei Times

⇒ The term is understood also to include actions seeking payment of royalties under patent license agreements, declarations of ownership of the right to obtain a patent or of patent rights, registration of transfers of patent rights, and litigation concerning the existence or ownership of an exclusive license.

(Excerpts from the judgment)

It is appropriate to construe “actions relating to patent rights” here as broadly encompassing litigation connected with patent rights, not limited to actions seeking injunctions or damages for patent infringement or payment of compensation for employee inventions, but also including litigation concerning agreements establishing exclusive or non-exclusive patent licenses, as in this case. Accordingly, because the first-instance plaintiff is domiciled in Tokyo and all first-instance defendants are domiciled in Saitama Prefecture, territorial jurisdiction at first instance belongs exclusively to the Tokyo District Court under Article 6(1) of the Code of Civil Procedure. The original judgment was therefore rendered without jurisdiction and must be reversed.

IP High Court, 2020 (Gyo-Ke) 10075, Package <Mori>

Original Ameblo publication: 2022-02-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12725250732.html

IP High Court, 2020 (Gyo-Ke) 10075, Package <Mori>

*Obviousness cannot be found solely on the basis of a common technical field.

*The problems were identified specifically, and motivation to combine was denied because the primary and secondary references addressed different problems.

⇒ Inventive step affirmed.

“Exhibit Ko 1 … prevents deformation of the container and distortion of the tube during packaging … Exhibit Ko 3 … addresses the problem of achieving high mechanical strength in the width direction perpendicular to the principal shrinkage direction …”

(Excerpts from the judgment)

The Exhibit Ko 1 Invention and the invention disclosed in Exhibit Ko 3 have little in common either in their problems or in their means of solution. Motivation to apply the matters disclosed in Exhibit Ko 3 to the Exhibit Ko 1 Invention therefore cannot be found. …

The defendant argues that the Exhibit Ko 1 Invention and the matters disclosed in Exhibit Ko 3 share the action and function of heat shrinkage. However, heat shrinkage is ordinarily only one of the basic actions and functions of a boxed-meal package. The defendant’s argument therefore amounts to finding motivation based substantially on a common technical field alone, which is insufficient as a basis for motivation. Accordingly, motivation to apply the heat-shrinkable film shown in the matters disclosed in Exhibit Ko 3 as the heat-shrinkable film in the Exhibit Ko 1 Invention cannot be found.

The Exhibit Ko 1 Invention and the matters disclosed in Exhibit Ko 3 are both found to belong to the technical field of boxed-meal packaging. … However, the Exhibit Ko 1 Invention addresses the problem, in a boxed-meal package using a heat-shrinkable tube, of preventing deformation of the container and distortion of the tube during packaging without cumbersome control of heat shrinkage, and also preventing deformation of the meal container when reheated by microwave at the store. … By contrast, the invention disclosed in Exhibit Ko 3 addresses the problem of making a heat-shrinkable film for a label that not only has good shrinkability in the longitudinal direction, its principal shrinkage direction, and high mechanical strength in the perpendicular width direction, but also has a good shrink finish after being wrapped directly from a film roll around a bottle and heat-shrunk, good workability in subsequent processing, and improved tearing behavior. … To solve its problem, the Exhibit Ko 1 Invention forms tube (20) from non-heat-shrinkable film (21) and heat-shrinkable film (22), as a tubular body in which the circumferential width of heat-shrinkable film (22) is no more than half the total tube circumference; heat shrinkage of film (22) reduces the tube circumference to approximately the outer circumference of the meal container and secures it to the container. By contrast, the heat-shrinkable film of the invention in Exhibit Ko 3 specifies respective numerical values as stated in its claims. The two inventions thus have little in common either in their problems or in their means of solution. Motivation to apply the matters disclosed in Exhibit Ko 3 to the Exhibit Ko 1 Invention therefore cannot be found.

IP High Court, 2020 (Gyo-Ke) 10103, Multicolor Penlight <Shoji>

Original Ameblo publication: 2022-02-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12726518744.html

IP High Court, 2020 (Gyo-Ke) 10103, Multicolor Penlight <Shoji>

*The trial decision erred in identifying the problem inherent in the primary reference.

*“Color rendering” in relation to the primary reference’s problem means something different from the “color rendering” identified as a technical matter disclosed in the secondary reference.

⇒ It cannot provide a basis for motivation.

⇒ Inventive step affirmed (trial decision rescinded).

(Excerpts from the judgment)

…Exhibit Ko 1 cannot be found to disclose a problem inherent in producing the yellow color designated “yellow.” …

The technical fields of the Exhibit Ko 1 Invention and the technical matters disclosed in Exhibit Ko 2 cannot be said to coincide completely; they are merely related. Thus, finding it easy to conceive of Invention 1 at Issue by adopting the technical matters in Exhibit Ko 2 in the Exhibit Ko 1 Invention requires commensurate motivation to make that adoption. …

As a premise for finding motivation to adopt the technical matters in Exhibit Ko 2 in the Exhibit Ko 1 Invention, and for finding that Invention 1 at Issue could readily have been conceived through that adoption, the Trial Decision at Issue found that the Exhibit Ko 1 Invention had a problem inherent in producing the yellow color designated “yellow” … and shared with Exhibit Ko 2 the problem of improving color rendering. … However, … the finding that the Exhibit Ko 1 Invention has a problem inherent in producing the yellow color designated “yellow” is erroneous. Moreover, the “color rendering” … identified by the Trial Decision at Issue in relation to the problem of the Exhibit Ko 1 Invention differs from the “color rendering” identified as a technical matter disclosed in Exhibit Ko 2—that is, “color rendering” in its general sense of whether the color of an illuminated object approximates its appearance under natural light. … The Trial Decision at Issue therefore erred in identifying the problem of the Exhibit Ko 1 Invention that would underpin motivation to adopt the technical matters in Exhibit Ko 2. … Such motivation cannot be found.

IP High Court, 2020 (Ne) 10025, Light-Emitting Device and Other Inventions <Mori>

Original Ameblo publication: 2022-02-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12726785172.html

IP High Court, 2020 (Ne) 10025, Light-Emitting Device and Other Inventions <Mori>

*Following the rule in the Grand Panel judgment, damages under Patent Act Article 102(3) were calculated on the basis of the defendant's products (televisions), not the patented products (LEDs).

⇒ ¥132 million awarded.

*The first instance (2017 (Wa) 27238 <Shibata>) awarded approximately ¥17.95 million based on LED sales.

(Excerpts from the judgment)

(a) The base to which the royalty rate is applied (royalty base)

(i) In addition to the points concerning Article 102(3) of the Patent Act noted in (1) above, (1) the LEDs at Issue were installed in direct-lit backlights used in the First-Instance Defendant's Products, and those backlights are one of the core components incorporated within those liquid crystal televisions and cannot be said to be readily separable from them; (2) LED performance greatly affects the picture quality of liquid crystal televisions, while the choice of LEDs and their manufacturing method also affect manufacturing costs; and (3) as described in (b) below, the first-instance defendant sold its products as finished products taking advantage of the characteristics of the LEDs at Issue and earned revenue from those sales. In light of these circumstances and others, it is appropriate to calculate the amount equivalent to a royalty under Article 102(3) based on sales of the First-Instance Defendant's Products. …

The First-Instance Defendant's Products, which are liquid crystal televisions, consist of many components other than the LEDs at Issue, so it is inappropriate simply to apply the royalty rate in (i) above. However, … the technology of Inventions 1 through 3 at Issue was greatly utilized in white LEDs for liquid crystal television back monitors, and the First-Instance Defendant's Products sold well … with image beauty as one selling point, among others. The technology of Inventions 1 through 3 at Issue therefore made a considerably large contribution to those sales. … Even taking into account circumstances such as the price of white LEDs …, it is appropriate to find that the royalty rate, when based on sales of the First-Instance Defendant's Products, is no lower than 0.5%.

Tokyo District Court, 2012 (Wa) 14227, Method for Manufacturing a p-Type Gallium Nitride Compound Semiconductor <Takano>

Original Ameblo publication: 2022-02-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12726788288.html

Tokyo District Court, 2012 (Wa) 14227, Method for Manufacturing a p-Type Gallium Nitride Compound Semiconductor <Takano>

★The permissible range of “impurities” is the range that does not impede the effects of the invention.

*“Substantially free of” ⇒ Infringement despite a trace amount.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-84218.pdf

Cf. Tokyo District Court, 2000 (Wa) 22926: non-infringement.

Cf. Tokyo District Court, 2000 (Wa) 12193: “free of,” with a trace amount found non-infringing.

(Excerpts from the judgment)

[Claim 1] …A method for manufacturing a semiconductor … characterized by annealing … in an atmosphere substantially free of hydrogen … to release hydrogen …

Using a gas containing hydrogen atoms, such as NH3 or H2, in the annealing atmosphere, or a material containing hydrogen atoms in the cap layer, is considered undesirable because the reaction for producing p-type conductivity—thermally dissociating hydrogen atoms bonded to p-type impurities—may fail to proceed and the above effects may not be achieved. Conversely, however, the reaction for producing p-type conductivity by thermally dissociating hydrogen atoms bonded to p-type impurities may proceed and achieve those effects. Accordingly, using a gas containing hydrogen atoms, such as NH3 or H2, in the annealing atmosphere, or a material containing hydrogen atoms in the cap layer, cannot be said to be entirely excluded.

If so, “an atmosphere substantially free of hydrogen” in constituent feature B should be construed to mean an atmosphere that produces such effects; in other words, an atmosphere containing hydrogen only to an extent that does not prevent obtaining a low-resistance p-type gallium nitride compound semiconductor through annealing.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-84218.pdf

Osaka District Court, 2016 (Wa) 2688, Coated Copper Wire for Ball Bonding

Original Ameblo publication: 2022-02-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12726972710.html

Osaka District Court, 2016 (Wa) 2688, Coated Copper Wire for Ball Bonding

★The permissible range of impurities is the range within which the problem can be solved.

⇒ The permissible Pd content is approximately 2%.

“If more than approximately 2% palladium (Pd) from the inner coating layer mixes into the surface coating layer formed of gold (Au), the problem-solving principle of the Inventions at Issue, utilizing the relative melting points of the metals, no longer holds.”

(Excerpts from the judgment)

…Where palladium is used for the intermediate coating layer, … the melting point increases above approximately 1064°C as the palladium content increases, and when the palladium content exceeds approximately 2%, it rises above copper’s intrinsic melting point of approximately 1085°C. … Thus, if more than approximately 2% palladium (Pd) from the inner coating layer mixes into the surface coating layer formed of gold (Au), the problem-solving principle of the Inventions at Issue, utilizing the relative melting points of the metals, no longer holds. Conversely, if palladium admixture remains within approximately 2%, the gold-palladium alloy’s melting point is lower than that of copper (Cu), and, as stated above, the melting point of that alloy reflects the respective intrinsic melting points of gold (Au) and palladium (Pd). The problem-solving principle of the Inventions at Issue therefore remains applicable. Accordingly, where palladium (Pd) is used for the intermediate coating layer, the “gold (Au) skin layer” need not consist solely of gold (Au), but, as the defendant argues in the alternative, should be construed to require a layer with no more than approximately 2% palladium (Pd) admixture.

Osaka District Court, 2006 (Wa) 6162, Lead-Free Solder Alloy <Yamada>

Original Ameblo publication: 2022-02-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12727151261.html

Osaka District Court, 2006 (Wa) 6162, Lead-Free Solder Alloy <Yamada>

*A case finding non-infringement for Product I, which contained a component not recited in the alloy claim.

★The permissible range of “impurities” is the range that does not impede the effects of the invention.

Even if exceptionally permitted, … they are limited to substances foreseeably having no effect on the improvement in the alloy’s fluidity. …

(Excerpts from the judgment)

…According to the Specification at Issue, the technical significance of the Invention at Issue lies in discovering that a lead-free solder alloy with the composition … “0.3–0.7% by weight Cu, 0.04–0.1% by weight Ni, and the balance Sn” … has the property of “suppressing formation of intermetallic compounds and improving fluidity.” In general, however, alloys normally differ greatly in properties when their component composition differs. This is considered to be why the composition of the Invention at Issue is strictly limited as stated above.

In light of these points, the Invention at Issue should be construed as not, in principle, permitting components other than those recited in constituent feature A. Even if exceptions are allowed, they are limited at most to unavoidable impurities identified as such in the Specification at Issue, or substances similarly and readily foreseeable, in light of common general technical knowledge at the filing date or priority date, as having no effect on the improvement in the alloy’s fluidity. The Defendant’s Product, however, contains 0.084% Ag as stated above, exceeding the permissible impurity range (0.05%) for Sn-Cu solder alloys under the JIS standard at the filing date or priority date of the Invention at Issue, and therefore cannot be regarded as an unavoidable impurity. Even if the JIS standard was amended after the filing or priority date, that amendment is presumed to have been based on the common general technical knowledge and circumstances at that later time. Thus, the fact that JIS Z 3282 enacted in 2006 specifies 0.10% Ag or less for Sn-Cu lead-free solder does not establish that it was readily foreseeable, in light of the common general technical knowledge at the filing or priority date, that approximately 0.084% Ag would not affect the improvement in the alloy’s fluidity. Nor is there other evidence sufficient to establish this.

Tokyo District Court, 2013 (Wa) 3360, Ferromagnetic Sputtering Target with Dispersed Nonmagnetic Material Particles <Hasegawa>

Original Ameblo publication: 2022-02-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12727328595.html

Tokyo District Court, 2013 (Wa) 3360, Ferromagnetic Sputtering Target with Dispersed Nonmagnetic Material Particles <Hasegawa>

★The permissible range of “impurities” is the range that does not impede the effects of the invention.

*“All particles” ⇒ Every particle must satisfy the limitation.

“Constituent feature 1-B … requires that none of the nonmagnetic material particles be coarse particles (…).”

(Excerpts from the judgment)

[Claim 1] …All particles of nonmagnetic material in the structure observed on a polished surface consist of particles that are smaller than every imaginary circle of radius 2 μm centered on any point within a nonmagnetic material particle, or have a shape and dimensions such that said imaginary circle and the interface between the ferromagnetic and nonmagnetic materials have at least two points of tangency or intersection …

Constituent feature 1-B … requires that none of the nonmagnetic material particles be coarse particles (particles large enough to contain an imaginary circle of radius 2 μm). According to the results of the commissioned expert examination and the parties’ arguments, however, at least four coarse particles exist on the polished surface of Defendant’s Product 1 after the second polishing. …

Tokyo District Court, 2017 (Wa) 44053, Combination Therapy for … B-Cell Lymphoma <Yamada>

Original Ameblo publication: 2022-02-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12727504574.html

Tokyo District Court, 2017 (Wa) 44053, Combination Therapy for … B-Cell Lymphoma <Yamada>

*According to the package insert for the Defendant's Formulation, its dosage and administration differ from the patented invention.

*The disclosures in the specification were not found to correspond to the use of the invention.

⇒ Rather than focusing on the problem to be solved, the court found no description or suggestion of the use of the invention.

(Excerpts from the judgment)

[Claim 1] A pharmaceutical composition comprising rituximab for use in combination with chemotherapy in a human patient in the treatment of low-grade/follicular non-Hodgkin's lymphoma (NHL), wherein a therapeutically effective amount of said pharmaceutical composition is administered to said patient during said chemotherapy, and said chemotherapy is CVP.

…In light of the descriptions in numerous publications issued before the filing date of the Original Application at Issue, it is appropriate to regard many of the publications cited by the plaintiffs as containing descriptions differing from the general understanding amid research into diverse chemotherapies. It is appropriate to find that CVP therapy and COP therapy were distinguished by the timing of cyclophosphamide administration: from day 1 through day 5 in CVP therapy, but only on day 1 in COP therapy.

…The package insert for the Defendant's Formulation includes "when used in combination with other antineoplastic agents" in the dosage and administration section. As a precaution relating to dosage and administration, it states: "When used in combination with other antineoplastic agents, thoroughly understand the content of the [Clinical Results] section regarding the dosing intervals, timing of administration, and other matters studied in clinical trials of the reference biologic, and refer to the latest domestic and overseas guidelines and the like." The clinical-results section states, as clinical results for the Defendant's Formulation, that patients with previously untreated advanced follicular lymphoma received either the Defendant's Formulation or the reference biologic under an R-CVP regimen. It also states, as clinical results for the reference biologic, that patients with follicular non-Hodgkin's lymphoma (NHL) received remission-induction therapy under an R-CVP regimen and other therapies in an overseas phase III clinical trial (the PRIMA trial). … The R-CVP regimen described in the package insert for the Defendant's Formulation is found to administer rituximab on day 1, cyclophosphamide (CPA) and vincristine (VCR) on day 1, and prednisolone or prednisone (PSL) from day 1 through day 5.

Accordingly, the Defendant's Formulation cannot be said to satisfy "CVP" in constituent feature 2B because the R-CVP regimen described in its package insert administers cyclophosphamide only on day 1, not from day 1 through day 5.

…Regarding the timing of administration of rituximab, identified as an anti-CD20 antibody or a chimeric anti-CD20 antibody, paragraph [0015] merely lists "before or after other therapies" alongside "simultaneously or within the same time frame (that is, the therapies proceed concurrently, but the drugs are not administered at exactly the same time)." Paragraph [0017] likewise merely lists "before … or after chemotherapy" alongside "during it." Neither explains the dosing periods or drug-free intervals of the agents used in chemotherapy. It is therefore difficult to recognize from those disclosures the use of

Invention 1 at Issue, in which rituximab is administered during the dosing periods of the respective agents in CHOP therapy. Nor, of course, can one recognize the use of Invention 3 at Issue, in which the pharmaceutical composition containing rituximab and the respective chemotherapy agents are administered on day 1 of each chemotherapy cycle. … These are use inventions specifying the target disease, the chemotherapy used in combination, and the timing of administration of a pharmaceutical composition containing rituximab. Paragraph [0015] does not specify the target disease or the combined chemotherapy, while paragraph [0017] does not specify the target disease and lists CHOP therapy only as one of numerous options for combined chemotherapy. In this respect as well, those passages are insufficient to be recognized as describing or suggesting the uses of Inventions 1 and 3 at Issue.

IP High Court, 2013 (Ne) 10026, Apparatus for Mixing Powder and Granular Material and Removing Fine Powder <Iimura>

Original Ameblo publication: 2022-02-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12728216862.html

IP High Court, 2013 (Ne) 10026, Apparatus for Mixing Powder and Granular Material and Removing Fine Powder <Iimura>

= Osaka District Court, 2008 (Wa) 10819

*General principle concerning “indispensable”

⇒ At first instance, indirect infringement under item (iv) was not established for Product I (indirect infringement under items (ii) and (v) was, however, established).

⇒ On appeal, indirect infringement under item (v) was likewise upheld (the appellate court adopted the first-instance reasoning).

Not an exclusively dedicated product ⇒ An injunction granted without limitation by use (excluding the injunction against export and import).

“It is appropriate to recognize the necessity of enjoining manufacture, sale, and other acts regardless of use, and granting such relief cannot be regarded as imposing an excessive burden on the defendant.”

(Excerpts from the first-instance judgment (Osaka District Court, 2008 (Wa) 10819), whose reasoning the appellate judgment adopted)

“Indispensable for resolving the problem through the invention” is a concept different from the constituent elements of the invention (invention-defining matters) recited in the claims. It can include tools, raw materials, and the like used to produce a product or use a method, even if they are not constituent elements of the invention.

Conversely, even a constituent element recited in the claims does not qualify as “indispensable for resolving the problem through the invention” if it was conventionally required irrespective of the problem the invention seeks to solve. In other words, parts, tools, raw materials, and the like whose use makes it possible for the first time to solve “the problem the invention seeks to solve” fall within that category. Put differently, it encompasses distinctive components, raw materials, tools, and the like that directly provide the particular configuration or ingredient characterizing the distinctive technical means, absent from the prior art, newly disclosed by the invention as a method of solving the problems of the prior art.

Accordingly, even components, ingredients, and the like recited in the claims are not “indispensable for resolving the problem through the invention” if they do not directly form the distinctive technical means newly disclosed by the invention to solve the problem. …

…Feature e of Product I is: “A level meter (70) is provided above horizontal pipe (4B) to measure the level of resin material within vertical pipe (4A) while said suction air source is stopped.” This is identical to the above “distinctive technical means absent from the prior art” relating to Patented Invention 2 at Issue. Product I therefore directly forms the distinctive technical means newly disclosed by Patented Invention 2 at Issue to solve the problem. …

Cardiac Pacemakers v. St. Jude Medical

35 U.S.C. § 271(f) does not apply to method claims.

(Reason) Congress enacted § 271(f) intending to overturn the Supreme Court's Deepsouth decision (406 U.S. 518 (1972)).

Deepsouth concerned exports of the "physical components" of an apparatus.

⇒ Legislative purpose

Judgment (English original): Cardiac Pacemakers, Inc. v. St. Jude Medical, Inc.

United States, April 2007, Supreme Court, Microsoft v. AT&T

Original Ameblo publication: 2022-02-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12728583561.html

United States, April 2007, Supreme Court, Microsoft v. AT&T

Copies of Windows installed on computers constitute “components” under 35 U.S.C. § 271(f).

An extra step—encoding the software instructions on a computer-readable medium to produce a copy—is needed to make software a usable, combinable part of a computer. ⇒ Such a copy, rather than abstract code itself, qualifies as a “component” that is “combinable” under § 271(f). In this case, the master disk “supplied” from the United States was not the copy actually installed on the foreign-made computers.

So long as copying of the code (information) occurs outside the United States, the copies (installed on computers) that constitute “components” have not been “supplied” from the United States.

Microsoft v. AT&T: Supreme Court Reverses the Lower-Court Judgment (jetro.go.jp)

United States, July 2004, CAFC, Pellegrini v. Analog Devices

Original Ameblo publication: 2022-02-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12728741625.html

United States, July 2004, CAFC, Pellegrini v. Analog Devices

Even if design and sales instructions concerning components of an invention covered by a U.S. patent are issued within the United States, there is no infringement of § 271(f)(1) so long as manufacture, sale, and offers for sale of the components occur outside the United States.

(Unless the components physically exist within the United States, they have not been “supplied” abroad.)

Gerald N. Pellegrini, Plaintiff-appellant, v. Analog Devices, Inc., Defendant-appellee, 375 F.3d 1113 (Fed. Cir. 2004) :: Justia

United States, June 2000, CAFC, Rotec v. Mitsubishi

Original Ameblo publication: 2022-02-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12729290697.html

United States, June 2000, CAFC, Rotec v. Mitsubishi

An offer to sell outside the United States does not constitute “supply … in or from the US” and therefore does not infringe 35 U.S.C. § 271(f)(2).

(Section 271(f)(2) requires actual supply of components. The “offer to sell” language of § 271(a) cannot be applied by analogy to § 271(f).)

ROTEC INDUSTRIES INC v. Mitsubishi International Corporation, Defendant-Appellee. | FindLaw

February 27, 2022 — I Took the 160th Unified Grade 2 Bookkeeping Examination (Paper-Based).

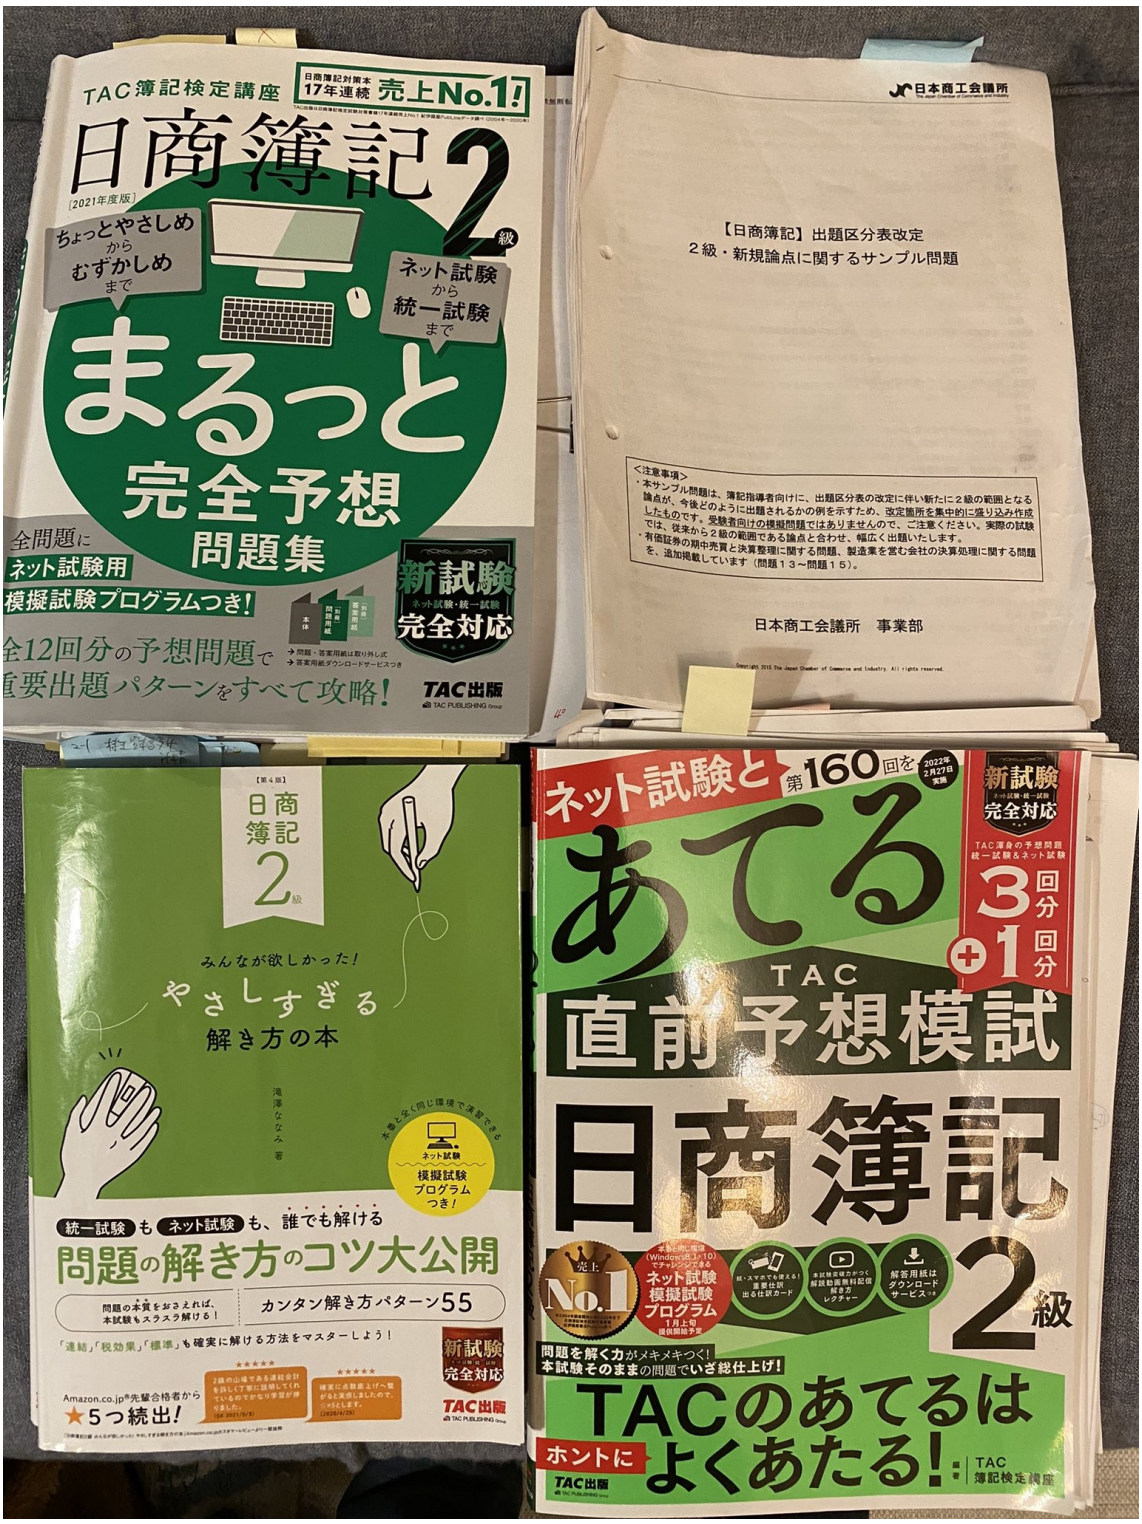
Original Ameblo publication: 2022-02-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12729291807.html

I took the 160th Unified Grade 2 Bookkeeping Examination (paper-based). (2022.02.27)

I am deliberately posting this before the results are out: it was considerably easier than the various predicted-question practice tests.

On the practice tests I only just reached 70 points and used the full 90 minutes, but in the actual examination I had 20 minutes left.



There is little information about whether the predicted questions match the actual examination's difficulty, so I am sharing my experience. (It will be quite a laugh if I fail … but I am posting despite the risk of embarrassment.)

Some candidates may feel discouraged because the predicted questions are too difficult. But the actual examination is not that hard, so please do not give up—keep at it!!

(Perhaps the predicted questions have not become easier even though the time limit was reduced from 120 minutes to 90. And because past papers since the time reduction have not been published, the available information seems likely to be skewed. However, the pass rate for recent unified examinations has not fallen, so it would not add up unless the questions had become easier—and that proved to be the case.)

Next, Grade 1 bookkeeping … no, I will not be doing that.

[Bookkeeping YouTuber?] Masayuki Fukushima — YouTube

Includes a computer-based mock-examination program that can be taken in exactly the same environment as the actual examination. Anyone can solve both the unified and computer-based examinations. Full disclosure of the tips for solving questions. If you grasp the essence of a question, you can solve the actual examination smoothly! 55 easy solution patterns. Master methods for reliably solving “consolidation,” “tax effects” and “standard costs” as well. A succession of five-star reviews from successful candidates on Amazon.co.jp. Fully compatible with the new examination. TAC Publishing.

Lower right: For the computer-based examination and the 160th examination, held on February 27, 2022. “Ataru: TAC Last-Minute Predicted Mock Examination,” Nissho Bookkeeping Grade 2. Fully compatible with the new examination, both computer-based and unified. TAC’s own predicted questions: three unified-examination sets plus one computer-based-examination set. No. 1 in sales. Includes a computer-based mock-examination program that can be challenged in the same environment as the actual examination (Windows 8 or 10), scheduled to become available from early January. Includes an important journal-entry completion card usable on paper or a smartphone; video mini-lectures on selected difficult important problems; and an answer-sheet download service. Your ability to solve questions will improve rapidly! Finish your preparation immediately before the examination with a sense of the actual questions. “TAC’s Ataru really predicts well!” Edited by TAC Bookkeeping Examination Course. TAC Publishing.

United States, June 2008, Supreme Court, Quanta v. LG Electronics

Original Ameblo publication: 2022-03-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12729470802.html

United States, June 2008, Supreme Court, Quanta v. LG Electronics

(1) Earlier U.S. case-law practice treated transfer within the United States as a fundamental prerequisite for "exhaustion." Quanta, however, focused not on whether the transfer occurred in the United States, but on whether it was authorized by the patentee (⇒ the U.S. Supreme Court's LEXMARK decision settled the issue).

(2) Patent rights covering method inventions are also subject to "exhaustion."

(3) The requirements for "exhaustion" of patent rights are not distinguished between product and method inventions.

(4) In a transfer of indirectly infringing products, where they "substantially embody" the patent, sale of the components by a licensee exhausts the patent rights. "Substantially embody" means both "(1) the components' only reasonable and intended use is to practice the patented invention" and "(2) the components practice the essential features of the patented invention."

(5) "Exhaustion" of patent rights resulting from an authorized sale could not be avoided, at least on the facts of that case. (The decision did not generally rule out avoiding "exhaustion" through a conditional license agreement.)

United States, May 2017, Supreme Court, IMPRESSION PRODUCTS v. LEXMARK

Original Ameblo publication: 2022-03-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12729660332.html

United States, May 2017, Supreme Court, IMPRESSION PRODUCTS v. LEXMARK

U.S. patent rights are exhausted even for items sold outside the United States!! (Different from Japan.)

Exhaustion bars enforcement of patent rights against a recycler that obtains used cartridges sold by the patentee subject to a single-use condition, refills them with ink, and sells them (citing the U.S. Supreme Court's 2008 Quanta decision). U.S. patent rights are also exhausted for items sold outside the United States. (Boesch v. Graff, cited by the CAFC, showed that patent rights are not exhausted where the foreign sale is unrelated to the patentee.) Contractual obligations remain binding. (*Related decision: in copyright infringement as well, the U.S. Supreme Court in Kirtsaeng held that the first-sale doctrine under 17 U.S.C. § 109(a) applies to overseas transfers.)

Transfer of Indirectly Infringing Products and "Exhaustion" of Patent Rights (jpaa.or.jp)

United States, 1961, Supreme Court, ARO <Exhaustion>

Original Ameblo publication: 2022-03-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12729835938.html

United States, 1961, Supreme Court, ARO <Exhaustion>

⇒ The conduct in that case was held to be “repair.” (*Anti-patent compared with Japan.)

Whether the component is indispensable is not important.

Purchasing a patented apparatus includes a license to use it—that is, the right to maintain the claimed combination in a condition fit for use insofar as it may be affected by wear or breakage.

• In distinguishing “repair” from “reconstruction,” the durability and expense associated with replacing a component, and whether it is indispensable, are not important.

• Purchasing a patented apparatus includes a license to use it—that is, the right to maintain the claimed combination in a condition fit for use insofar as it may be affected by wear or breakage.

• “Reconstruction” is limited to “such a true reconstruction of the entity as to ‘in fact make a new article,’ after the entity, viewed as a whole, has become spent.”

May 2002, CAFC, Husky v. R&D Tool & Engineering

Original Ameblo publication: 2022-03-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12730022079.html

2002.05 CAFC Husky v. R&D Tool & Engineering

(1) Where the entire patented subject matter has been spent and reconstruction is necessary to make it usable again,

⇒ This constitutes “reconstruction” and infringes the patent. (Cotton-Tie Co. v. Simmons, 106 U.S. (16 Otto) 89 (1882))

(2) Where a worn-out component is replaced,

⇒ Under the rule laid down by the U.S. Supreme Court in Aro, replacement of the worn-out component is “repair” (unless that component is separately patented) and does not constitute “reconstruction.”

(3) Where a component that has not worn out is replaced to change the apparatus’s function,

⇒ This is akin to “repair” and does not infringe.

Judgment (English original): Husky Injection Molding Systems Ltd. v. R & D Tool & Engineering Co., 291 F.3d 780

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12730261006.html

May 2011, U.S. Supreme Court, Global-Tech v. SEB

To establish induced infringement (35 U.S.C. § 271(b)), in addition to (1) the existence of direct infringement, (2) knowledge that the direct infringement would occur, or willful blindness to the fact of infringement, is required!!

⇒ When exporting copied products from Hong Kong to the United States, the alleged infringer did not tell the U.S. attorney preparing the opinion that the products had been copied.

Global-Tech Appliances, Inc. v. SEB S.A. - Wikipedia

May 2015, U.S. Supreme Court, Commil v. Cisco

Original Ameblo publication: 2022-03-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12730261330.html

May 2015, U.S. Supreme Court, Commil v. Cisco

A good-faith belief that a patent is invalid does not prevent induced infringement (35 U.S.C. § 271(b)) from being established.

Read with Global-Tech, a good-faith belief in non-infringement may negate the knowledge required for induced infringement, but merely obtaining a non-infringement opinion does not automatically defeat liability. A belief that the patent is invalid is not a defense negating that knowledge.

13-896 Commil USA, LLC v. Cisco Systems, Inc. (05/26/2015) (govinfo.gov)

2005, CAFC, NTP v. Research in Motion (BlackBerry Case)

Original Ameblo publication: 2022-03-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12730571370.html

August 2005, CAFC, NTP v. Research in Motion (BlackBerry Case)

Use of a product (system) invention occurs at “the place where control of the system is exercised and beneficial use of the system is obtained.”

For a method invention, each step must be performed within the United States, and “a process cannot be used ‘within’ the United States as required by § 271(a) unless each step is performed within the United States.”

⇒ No infringement of the method claims; infringement of the system claims.

“RIM’s customers located in the United States controlled transmission of information and benefited from the resulting exchange of information.”

⇒ Centillion v. Qwest (January 2011) and Georgetown Rail Equipment v. Holland (August 2017) are to the same effect for product (system) inventions.

U.S. CAFC Decision, NTP, Inc. v. Research In Motion, Ltd. | Latest IP Information | Itoh International Patent Office (itohpat.co.jp)

June 2014, U.S. Supreme Court; August 2015, CAFC, LIMELIGHT v. AKAMAI

Original Ameblo publication: 2022-03-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12730744428.html

June 2014, U.S. Supreme Court, LIMELIGHT v. AKAMAI

For method inventions, the Court held that induced infringement under 35 U.S.C. § 271(b) requires direct infringement and relied in part on a comparison with § 271(f)(1) to reverse the CAFC en banc decision finding induced infringement.

(A case where customers performed part of the method invention. ⇒ Continued in the August 2015 CAFC en banc decision.)

2015.08 CAFC en banc　AKAMAI v. LIMELIGHT

★After the June 2014 Supreme Court decision, the issue was direct infringement (§ 271(a)), not induced infringement (§ 271(b)).

Where a method invention is divided among multiple actors, direct infringement is established if all steps are performed by or attributable to a single entity.

Examples: directing or controlling another party; forming a joint enterprise with another party.

Narrowing Amendments During Prosecution and the Doctrine of Equivalents: Global Case-Law Trends and Japanese Cases

Original Ameblo publication: 2022-03-09

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12730925337.html

<Narrowing Amendments During Prosecution and the Doctrine of Equivalents: Global Case-Law Trends and Japanese Cases>

Under Japanese case law, infringement under the doctrine of equivalents requires the following five conditions. (Supreme Court, February 24, 1998, “Ball Spline”; Supreme Court, March 24, 2017, “Maxacalcitol”)

1. The part of the patented invention’s configuration differing from the accused product or process is not an essential part of the patented invention. (Non-essential part)

2. Even if the differing part is replaced with the corresponding feature of the accused product or process, the purpose of the patented invention can be achieved and the same effects are produced. (Replaceability; identity of effects)

3. Replacing the differing part with the corresponding feature of the accused product or process could readily have been conceived at the time of manufacture or other relevant act involving the accused product or process. (Ease of replacement)

4. The accused product or process is not identical to the publicly known technology at the filing date of the patented invention, nor readily inferable from that publicly known technology.

5. There are no special circumstances, such as the accused product or process having been intentionally excluded from the claims during prosecution of the patented invention.

Earlier Japanese cases applied the so-called “file-wrapper estoppel” doctrine to claim limitations added by amendment in response to a notice of reasons for refusal for lack of novelty or inventive step, finding equivalence unavailable under the fifth requirement.

In contrast, two decisions have now found the fifth requirement satisfied and recognized infringement under the doctrine of equivalents for limitations added by amendment in response to a lack-of-inventive-step rejection. I introduce them below while comparing the situation in other countries (the United States, Germany, and the United Kingdom).

Tokyo District Court, 2017 (Wa) No. 18184, “Osteotomy Spreader,” held: “The written opinion contains no statement showing awareness of or suggesting the configuration of the engagement portion—that is, whether it is formed as part of the swinging member or by a member separate from the swinging member. Accordingly, … that statement cannot establish that, when constituent feature E was added by the Amendment at Issue filed together with the opinion, the plaintiff intentionally excluded from the claims a configuration in which the engagement portion is a member separate from the swinging member.” The court recognized infringement under the doctrine of equivalents (the fifth requirement was satisfied).

Tokyo District Court, 2016 (Wa) 25436, “Method for Producing L-Glutamic Acid,” held: “At the filing date, it cannot be found that the plaintiff, as applicant, could readily have identified a specific configuration using a mutant yggB gene derived from Corynebacterium callunae capable of solving the problem addressed by Invention 2 at Issue and recited it in the claims in a manner satisfying the support requirement and other disclosure requirements. … No special circumstances can be found. …” The court recognized infringement under the doctrine of equivalents (the fifth requirement was satisfied).

What is important here is that **the reference date for foreseeability was the filing date.** The judgment does not state the reason. However, even if reciting the feature in the claims "in a manner satisfying the support requirement and other disclosure requirements" would have been readily possible at the amendment date, amendments may be made only within the scope of the original specification. Setting the reference date at the "amendment date" would therefore be harsh on the applicant, which is presumably the reason.

The use of the filing date as the reference date for foreseeability is **consistent with the U.S. Supreme Court's May 2002 Festo decision. While adopting a flexible bar, Festo set out "three grounds for rebutting the presumption when prosecution history estoppel applies: (1) the subject matter was unforeseeable 'at the time of the application'; (2) the underlying reason for the narrowing amendment bears only a tangential relation to the subject matter; and (3) there is a reasonable explanation for why the subject matter could not have been described." (However, many subsequent CAFC decisions used the "amendment date" as the reference date for unforeseeability, and those decisions are said to have created the trend toward using that date. ("Prosecution History Estoppel, Equivalents at the Filing Date, and the Doctrine of Equivalents," Yasuyuki Echi, Annual Report of the Japan Association of Industrial Property Law (2015).))**

This tendency to recognize infringement under the doctrine of equivalents (on the premise of a **Flexible Bar**) for limitations added by amendment in response to a lack-of-inventive-step rejection had been recognized by the UK Supreme Court and the German Federal Court of Justice in the "Eli Lilly" litigation pending in various countries shortly before the two Japanese decisions above. It was therefore suggested that Japan might follow, and that is what actually happened.

The "Eli Lilly" Cases in the United States, United Kingdom, and Germany ⇒ Equivalence Recognized for Narrowed Claims in All Three

● UK Supreme Court, [2017] UKSC 48 (v. Actavis) — The first Supreme Court decision recognizing the doctrine of equivalents in the United Kingdom

⇒ Although the claims were narrowed during European prosecution, the amendment was held to have been intended to overcome an added-matter objection based on an impermissible intermediate generalization, and merely to satisfy the amendment requirements.

● German Federal Court of Justice, [2016] X ZR 29/15 (v. Actavis)

⇒ If an amendment limits the subject matter over the prior art, the doctrine of equivalents is excluded. However, an amendment prompted by formal requirements (added matter or clarity) is not deemed a selection decision by the patentee, and the doctrine of equivalents is not excluded.

● U.S. CAFC, August 9, 2019 (Eli Lilly and Company v. Hospira, Inc.)

⇒ Prosecution history estoppel arises where a patent applicant narrows claim scope during prosecution for a substantial reason relating to patentability. Such a narrowing amendment creates a presumption that all equivalents within the territory between the original and amended claims have been surrendered. The patentee may rebut that presumption, for example by proving that the reason for the amendment bears only a "tangential" relation to the equivalent in question.

Finally, I also introduce the Supreme Court's March 24, 2017, "Maxacalcitol" decision because it is an important precedent on the fifth requirement of the doctrine of equivalents. It does not, however, concern the "file-wrapper estoppel" discussed above, but rather **the dedication doctrine (typically, the doctrine that a feature disclosed in the specification but not claimed is deemed dedicated to the public and is unavailable under the doctrine of equivalents)**.

The Supreme Court held: "Where, at the filing date, the applicant **could readily have conceived** of the configuration of the accused product or process corresponding to the differing part of the claimed configuration but did not recite it in the claims, and where it can be said that, **viewed objectively and**

externally, the applicant indicated that it deliberately refrained from claiming that configuration despite recognizing it as an alternative to the configuration recited in the claims, special circumstances exist, such as the accused product or process having been intentionally excluded from the claims during prosecution of the patented invention. …”

Nevertheless, including the facts of “Maxacalcitol,” Japan has hardly any decisions (possibly none) denying the fifth requirement of the doctrine of equivalents under **the dedication doctrine**. Although it is a general principle stated by the Supreme Court, it is a dangerous, leaky boat for an alleged infringer to rely on.

End

“Infringement of a U.S. Patent by Importing into the United States … Products Made by a Process Covered by That Patent” (Takayuki Yahagi)

Original Ameblo publication: 2022-03-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12731096042.html

(Article Introduction)

“Infringement of a U.S. Patent by Importing into the United States, Selling There, or Otherwise Dealing in Products Made by a Process Covered by That U.S. Patent” (Takayuki Yahagi, Japanese Patent Attorney and New York Attorney)

United States, December 2019, CAFC, Syngenta v. Willowood

The “single-entity requirement” (that all steps recited in the claim be performed by, or in a manner attributable to, a single person) does not apply to 35 U.S.C. § 271(g), the “provision treating importation into the United States and similar acts involving products made by a process covered by a U.S. patent as infringement of that U.S. patent.”

Even products made outside the United States through a process divided among multiple persons infringe the U.S. patent under § 271(g) if imported into the United States.

(*Different from 35 U.S.C. § 271(a).)

35 U.S.C. § 271(a)

Except as otherwise provided in this title, whoever without authority makes, uses, offers to sell, or sells any patented invention within the United States, or imports any patented invention

into the United States during the term of the patent therefor, infringes the patent.

35 U.S.C. § 271(g)

Whoever without authority imports into the United States or offers to sell, sells, or uses within the United States a product made by a process patented in the United States shall be liable as an infringer if the importation, offer to sell, sale, or use of the product occurs during the term of that process patent. In an action for infringement of a process patent, no remedy may be granted for infringement on account of noncommercial use or retail sale of a product unless there is no adequate remedy under this title on account of the importation or other use, offer to sell, or sale of that product. For purposes of this title, a product made by a patented process is no longer considered to have been made by that process after—

(1) it is materially changed by subsequent processes; or

(2) it becomes a trivial and nonessential component of another product.

Infringement of a U.S. Patent by Importing into the United States, Selling There, or Otherwise Dealing in Products Made by a Process Covered by That U.S. Patent (jpaa.or.jp)

IP High Court, 2020 (Gyo-Ke) 10124, Method for Manufacturing … Ink Composition <Shoji> — *Not an Issue of “Obviousness upon Obviousness”

Original Ameblo publication: 2022-03-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12731264347.html

IP High Court, 2020 (Gyo-Ke) 10124, Method for Manufacturing a Solvent-Based Gravure Printing Ink Composition for Reverse Printing <Shoji>

*Not an issue of “obviousness upon obviousness”

“A person skilled in the art would be motivated … to use biomass-derived components as raw materials for Exhibit Ko 1 Invention 1. … This does not assess obviousness after adding to Exhibit Ko 1 Invention 1 a configuration of the kind alleged by the plaintiff. …”

(Excerpts from the judgment)

The plaintiff argues, concerning Difference 2, that … the Decision at Issue assessed obviousness after adding to Exhibit Ko 1 Invention 1 the feature of “using biomass-derived components as raw materials for the polyurethane-urea resin composition,” and that this … reasoning corresponds to “obviousness upon obviousness.”

However, … at the Priority Date at Issue, increasing the biomass content of products to at least 10% by mass was a general problem in the technical field of printing inks. In those circumstances, a person skilled in the art would have motivation to use biomass-derived components as raw materials for the polyurethane-urea resin composition of Exhibit Ko 1 Invention 1 and, further, to use biomass-derived sebacic acid as such a component. In light of this analysis, the assessment does not add a configuration of the kind alleged by the plaintiff to Exhibit Ko 1 Invention 1 before assessing obviousness, nor does its reasoning stand in the relationship of so-called “obviousness upon obviousness.”

The Scope of “Obviousness upon Obviousness” (The Role of a Third Prior-Art Document) (jpaa.or.jp)

— Tokyo District Court, 2016 (Wa) 25436, Method for Producing L-Glutamic Acid <Presiding Judge Yamada> —

Original Ameblo publication: 2022-03-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12731540844.html

Tokyo District Court, 2016 (Wa) 25436, Method for Producing L-Glutamic Acid <Presiding Judge Yamada>

(1) A case finding infringement under the doctrine of equivalents for a method excluded by an amendment responding to a lack-of-inventive-step rejection (consistent with the global tendency to apply the flexible bar flexibly).

(2) An "offer for transfer" was established although the transferor and the person making the offer differed and the "transfer" occurred abroad.

◆ Full text of the judgment

[Summary of This Judgment and Some Observations]

1. Claims (Corrected Invention 2-2 at Issue)

"A coryneform bacterium having the ability to produce L-glutamic acid, whose L-glutamic acid-producing ability is improved relative to an unmodified strain through introduction of a mutant yggB gene, wherein the mutation in said mutant yggB gene substitutes threonine for alanine at position 100 and/or threonine or valine for alanine at position 111 in the amino acid sequence of SEQ ID NO: 6, 62, 68, 84, or 85."

2. Excerpts from the Judgment (1): Doctrine of Equivalents

(1) Three Differences Between Corrected Invention 2-2 at Issue and Defendant's Process 4

"Difference 1: The introduced mutant yggB gene is derived from Corynebacterium glutamicum (the amino acid sequence before mutation is SEQ ID NO: 6) in the strain with the type-19-mutation configuration, whereas in the strains used in Defendant's Process 4 (strains (12) and (13)), it is derived from Corynebacterium callunae (strain DSM20147).

Difference 2: The mutation introduced into the yggB gene substitutes threonine for alanine at position 100 of the amino acid sequence encoded by the yggB gene (A100T mutation) in the strain with the type-19-mutation configuration, whereas in the strains used in Defendant's Process 4 it substitutes threonine for alanine at position 98 of the amino acid sequence encoded by the yggB gene (A98T mutation).

Difference 3: In the type-19-mutation configuration, only the A100T mutation is introduced into the yggB gene, whereas in the strains used in Defendant's Process 4, in addition to the A100T mutation [sic], a mutation substituting isoleucine for valine at position 241 of the amino acid sequence encoded by the yggB gene (V241I mutation) is also introduced."

(2) First Requirement (*None of the three differences is an essential part.)

"Compared with the prior art described in Specification 2 at Issue, the distinctive technical concept (problem-solving principle) of Invention 2 at Issue, absent from the prior art, lies in providing a new technology for increasing glutamic-acid production capacity by focusing on the yggB gene of coryneform

bacteria, whose effect on glutamic-acid production was previously unknown, and modifying YggB protein, a type of mechanosensitive channel, using mutant yggB genes such as those with C-terminal mutations or mutations in transmembrane regions. …

Accordingly, none of Differences 1 through 3 between the type-19-mutation configuration and Defendant's Process 4 is an essential part of the patented invention. Defendant's Process 4 using strains (12) and (13) is therefore found to satisfy the first requirement for equivalence."

(3) Third Requirement (*Ease of replacement was recognized under the same framework as inventive-step analysis. A double standard for the third requirement of equivalence was argued, but no specific assessment was given.)

"…It is appropriate to find that a person skilled in the art could readily have conceived, as of July 2016 when manufacture using Defendant's Process 4 began, of replacing the features of the type-19-mutation configuration with those relating to Differences 1 and 2: namely, replacing Corynebacterium glutamicum with Corynebacterium callunae as the strain from which the mutant yggB gene is derived and, correspondingly, changing the position in the amino acid sequence encoded by the yggB gene at which alanine is replaced by threonine from position 100 to position 98.

The defendant argues that 'readily conceivable' under the third requirement should mean a degree of ease such that every person skilled in the art can recognize it as if it were expressly recited in the claims, and that such ease did not exist here. However, in light of the above circumstances, measured against the average technician in the industry of glutamic-acid fermentation using bacteria to which Invention 2 at Issue belongs—that is, a person skilled in the art—Differences 1 and 2 must be regarded as readily conceivable, and the defendant's argument on this point cannot be accepted. …"

(4) Fifth Requirement (*A case finding infringement under the doctrine of equivalents for a method excluded by an amendment responding to a lack-of-inventive-step rejection, consistent with the global tendency to apply the flexible bar flexibly.)

"…As a result of two amendments made in response to notices of reasons for refusal, … configurations using a mutant yggB gene derived from Corynebacterium callunae, as in Defendant's Process 4, ceased to fall literally within the technical scope of Invention 2 at Issue. Moreover, … at filing, Specification 2 at Issue mentioned Corynebacterium callunae only in paragraphs [0012] and [0013], and those portions were not amended in the above amendments. …

(a) Under the fifth requirement, equivalence cannot be asserted where special circumstances exist, such as the accused product or process having been intentionally excluded from the claims during prosecution of the patented invention. The reason is that, where the patentee has once acknowledged that a product or process is outside the technical scope of the patented invention, or has acted in a manner that can outwardly be understood that way, estoppel bars the patentee from later making a contrary assertion (see the 1998 and 2017 Supreme Court judgments).

(b) …Claim 1 as filed could encompass configurations using a mutant yggB gene derived from Corynebacterium callunae, such as Defendant's Process 4, but the amendments caused such configurations to cease to be literally included in Invention 2 at Issue.

(c) However, … the complete genome of Corynebacterium callunae strain DSM20147 and the amino acid sequence encoded by its yggB gene were not analyzed and made available until around March 2013 or later. At the Priority Date at Issue … or the filing date …, it was not possible to identify the amino acid sequence encoded by the yggB gene of Corynebacterium callunae. Accordingly, …**at the filing date, it cannot be found that the plaintiff, as applicant, could readily have identified a specific configuration using a mutant yggB gene derived from Corynebacterium callunae capable of solving the problem addressed by Invention 2 at Issue and recited it in the claims in a manner satisfying the support requirement and other disclosure requirements.**

(d) Furthermore, … claim 1 as filed did not identify any bacterial species more specifically than the general expression ‘a coryneform bacterium having the ability to produce L-glutamic acid.’ In particular, it did not describe a configuration using a mutant yggB gene derived from Corynebacterium callunae. References to Corynebacterium callunae in Specification 2 at Issue merely list it as an example of bacteria usable as the coryneform bacterium of Invention 2 at Issue ([0012], [0013]). Specification 2 at Issue contains no reference to a configuration using a yggB gene derived from Corynebacterium callunae either before or after the amendments.

(e) In light of the circumstances in (c) and (d), the filing and amendment history in (b), viewed objectively and externally, does not indicate an intention deliberately to exclude from the claims a configuration using a mutant yggB gene derived from Corynebacterium callunae. Nor does all the other evidence in this case establish, for Defendant’s Process 4, special circumstances under the fifth requirement, such as intentional exclusion from the claims during prosecution of the patented invention.”

3. Excerpts from the Judgment (2): Support and Enablement Requirements

Before correction, the support requirement was not satisfied because the claim included subject matter incapable of solving the problem. ⇒ Satisfied through the correction-based reply to the invalidity defense.

“Among the inventions recited in Invention 1-1 at Issue, at least the methods for producing arginine using coryneform bacteria with mutations introduced into the GDH, CS, ICDH, and PDH genes exceed the scope within which a person skilled in the art could recognize, from the detailed description of the invention in Specification 1 at Issue, that the above problem of constructing, through genetic recombination or mutation, mutant strains capable of producing amino acids in high yield could be solved. Nor, beyond the disclosures in Specification 1 at Issue, can common general technical knowledge at the filing date be found that would enable a person skilled in the art to solve that problem for arginine-production methods using mutations in those genes. …

Invention 1-1 at Issue before correction included inventions using coryneform bacteria with a particular nucleotide sequence introduced into the promoter sequence of the ICDH gene, PDH gene, or argininosuccinate synthase gene. Correction 1 at Issue removed those inventions from Corrected Invention 1-1 at Issue. Accordingly, neither a support-requirement violation nor an enablement-requirement violation concerning introduction of mutations into the promoters of the ICDH, PDH, and argininosuccinate synthase genes can be found for Corrected Invention 1-1 at Issue.”

4. Excerpts from the Judgment (3): Offers for Transfer

(1) An “offer for transfer” was established even though the transferor and the person making the offer differed, where they had a certain relationship. (2) An offer for transfer was established even though the “transfer” occurred abroad. (3) Patent Act Article 102(2) was applied using overseas sales as the basis. (There were special circumstances: all foreign sales were to Japanese buyers, and even though delivery itself occurred on shipment, subsequent importation into Japan by the buyers was contemplated.)

<In this case, all the Defendant’s Processes were used abroad, and the resulting products were imported into and sold in Japan.>

“…Although the transfer itself of the MSG at Issue in the CJ Indonesia Sales cannot be found to have taken place within Japan, … considering the relationship between the defendant and CJ Indonesia within the CJ Group; … the fact that purchase orders for CJ Indonesia Sales were sometimes submitted to the defendant and forwarded through it to CJ Indonesia; … the Commission Agreement at Issue between the defendant and CJ Indonesia providing for payment to the defendant of part of the revenue from CJ Indonesia Sales; … the defendant’s delivery of samples and collection of defective MSG at Issue in Japan in connection with CJ Indonesia Sales; and … the recording of expenses relating to CJ Indonesia Sales in the defendant’s

accounts, … it is appropriate to find that, during the periods in which the Defendant's Processes were used, the defendant jointly conducted sales activities for CJ Indonesia Sales with CJ Indonesia within Japan, and that the defendant made offers for transfer. Since … the MSG at Issue manufactured during those periods was manufactured by one of the Defendant's Processes (the Defendant's Products), the defendant's offers for transfer of the MSG at Issue during those periods constitute working of Invention 1 or Invention 2 at Issue by the defendant (Patent Act Article 2(3)(iii)). …

(a) The defendant argues that an 'offer for transfer' is an act performed by the seller, who will be the transferor, and that no offer for transfer exists where the person performing the offering act, such as advertising, differs from the person making the transfer. Thus, even if the defendant, which was not the seller, had some involvement in CJ Indonesia Sales, its acts did not constitute offers for transfer. However, in light of the purpose of treating offers for transfer as acts of working distinct from transfers, an offering act should be capable of being construed as an offer for transfer even if not performed by the seller/transferor, where circumstances exist such as its being performed by a person having a certain relationship with that seller. … CJ Indonesia and the defendant belong to the same corporate group and had a close relationship, including entering into the Commission Agreement at Issue and sharing profits from CJ Indonesia Sales. The fact that CJ Indonesia, rather than the defendant, was the party to the sales contracts does not prevent a finding that the defendant's … involvement constituted offers for transfer of the MSG at Issue.

(b) The defendant also argues that 'transfer' under the Patent Act means a transfer within Japan and that an 'offer for transfer,' as a preparatory act, likewise means an offer for a transfer within Japan; thus, its acts concerning CJ Indonesia Sales do not constitute offers for transfer. It is true that … the transfer to buyers of the MSG at Issue in CJ Indonesia Sales took place outside Japan. However, all CJ Indonesia Sales were to Japanese buyers, and even if delivery itself occurred on shipment, subsequent importation into Japan by those buyers was contemplated. In light of the purpose of treating offers for transfer as acts of working distinct from transfers, for goods such as the MSG at Issue in CJ Indonesia Sales that are sold to Japanese buyers as a result of sales activities in Japan and imported into Japan, it is inappropriate to reach different conclusions on whether those sales activities constitute offers for transfer in Japan solely according to whether transfer to the buyer occurs outside or inside Japan. … It is therefore appropriate to construe the defendant's and CJ Indonesia's joint sales activities in Japan concerning CJ Indonesia Sales as 'offers for transfer' by the defendant, and the defendant's argument cannot be accepted. …

The defendant argues that damages from the act of working consisting of 'offers for transfer' in connection with CJ Indonesia Sales should not be calculated from the revenue of those sales but should be confined to the scope peculiar to the 'offers for transfer.' However, … the defendant and CJ Indonesia are joint tortfeasors concerning CJ Indonesia Sales, so damages must take account of the profits not only of the defendant but also of defendant CJ Indonesia. … All CJ Indonesia Sales were to Japanese buyers, and importation into Japan after delivery to those buyers was contemplated. Thus, even if the 'transfer' itself occurred abroad, it is appropriate, for purposes of Article 102(2) of the Patent Act, to regard the defendants' profits calculated from the revenue of CJ Indonesia Sales as profits obtained through 'offers for transfer' within Japan. The defendant's argument cannot be accepted."

5. Some Observations on the Doctrine of Equivalents

(1) The First Requirement

The analysis follows the criteria of the Intellectual Property High Court Grand Panel decision in Maxacalcitol.

⇒ Even though there are three differences, the criteria are applied straightforwardly to each.

<Reference> [Patent ★★★] Supreme Court Decision Affirming the Intellectual Property High Court Grand Panel Judgment Finding Infringement under the Doctrine of Equivalents of a Patented Invention Relating to a Method for Producing a Chemical Substance (Maxacalcitol)

https://www.nakapat.gr.jp/ja/legal_updates_jp/%E6%97%A5%E6%9C%AC%E8%AA%9E-%E3%80%90%E7%89%B9%E8%A8%B1%E2%98%85%E2%98%85%E2%98%85%E3%80%91%E5%8C%96%E5%AD%A6%E7%89%A9%E8%B3%AA%EF%BC%88%E3%83%9E%E3%82%AD%E3%82%B5%E3%82%AB%E3%83%AB%E3%82%B7/

(2) The Third Requirement

The case-law and prevailing view is that the third requirement of equivalence (ease of replacement), although assessed at a different reference date, is harder to satisfy than obviousness in inventive-step analysis, and applies a standard requiring “a degree of ease such that, unlike under Article 29(2) of the Patent Act, every person skilled in the art can recognize it as if it were expressly recited in the claims” (Tomoji Yamada, “Significance and Function of the Third Requirement of the Doctrine of Equivalents,” Intellectual Property Management, Vol. 63, No. 5, 2013).

Applying that standard would seem likely to result in rejection of the third requirement, and hence equivalence, in many cases. A review of past decisions, however, shows extremely few cases that affirmed the first and/or second requirement but rejected only the third.

⇒ Among judgments rejecting ease of replacement under the third requirement, four held that the claimant must allege and prove the higher threshold, beyond obviousness in inventive-step analysis, of “a degree of ease such that, unlike under Article 29(2) of the Patent Act, every person skilled in the art can recognize it as if it were expressly recited in the claims.” (The three cases presented in “Case-Law Trends and Strategies Concerning the Doctrine of Equivalents,” Patent, Vol. 70, No. 1, p. 54, cited below, and Tokyo District Court, 2016 (Wa) No. 7763, Self-Laminating Rotatable Cable Marker Label with a Split Portion <Shimasue>.)

However, examining judgments affirming ease of replacement under the third requirement shows that many do not demonstrate matters to that extent but adopt the same framework as obviousness in inventive-step analysis. Conversely, many judgments rejecting ease of replacement adopt a different framework. A comprehensive examination thus reveals a tendency: decisions affirming the third requirement frequently use the inventive-step obviousness framework, while those rejecting it use a different framework and impose a higher threshold. Put another way, in cases affirming the third requirement, ease of replacement is accepted at approximately the same level as inventive-step obviousness. In cases rejecting it, however, courts require “a degree of ease such that, unlike under Article 29(2) of the Patent Act, every person skilled in the art can recognize it as if it were expressly recited in the claims,” and tend not to proceed to analyze whether a person skilled in the art could readily have conceived of it even without its being described in a publicly known document.

Against that background, this judgment (Tokyo District Court, 2016 (Wa) No. 25436 <Yamada>, Method for Producing L-Glutamic Acid) held: “**The defendant argues that ‘readily conceivable’ under the third requirement should mean a degree of ease such that every person skilled in the art can recognize it as if it were expressly recited in the claims, and that such ease did not exist here. However, in light of the above circumstances, measured against the average technician in the industry of glutamic-acid fermentation using bacteria to which Invention 2 at Issue belongs—that is, a person skilled in the art—Differences 1 and 2 must be regarded as readily conceivable**, and the defendant’s argument on this point cannot be accepted.” Without directly answering the defendant’s argument identifying a double standard for the third requirement, the court rejected it in one line as if the two standards were identical.

However, the Tokyo District Court’s decision in 2016 (Wa) No. 7763, Self-Laminating Rotatable Cable Marker Label with a Split Portion <Shimasue>, cited below, held: “**The third requirement that a ‘person**

skilled in the art' 'could readily have conceived of [the replacement] at the time of manufacture or other relevant act involving the accused product or process' differs from 'could easily have made the invention' based on publicly known inventions under Article 29(2) of the Patent Act or 'could readily have inferred' by a 'person skilled in the art' under the fourth requirement. It requires a degree of ease such that every person skilled in the art can recognize it as if expressly recited in the claims—that is, as substantially identical (see Tokyo District Court, October 7, 1998, 1991 (Wa) No. 10687, Hanrei Jiho No. 1657, p. 122)." It thus rejected the third requirement using a criterion clearly different from inventive-step analysis.

This judgment too raises concern about a double standard for the third requirement. In any event, the accumulation of future decisions will need close attention.

Reference: "Case-Law Trends and Strategies Concerning the Doctrine of Equivalents," Patent, Vol. 70, No. 1, p. 54

https://system.jpaa.or.jp/patents_files_old/201701/jpaapatent201701_054-067.pdf

(3) The Fifth Requirement

This judgment held: "…**At the filing date, it cannot be found that the plaintiff, as applicant, could readily have identified a specific configuration using a mutant yggB gene derived from Corynebacterium callunae capable of solving the problem addressed by Invention 2 at Issue and recited it in the claims in a manner satisfying the support requirement and other disclosure requirements.**" It thus recognized infringement under the doctrine of equivalents for a method excluded by an amendment responding to a lack-of-inventive-step rejection, consistent with the global tendency to apply the flexible bar flexibly.

Further, the criterion of whether it "**would readily have been possible to recite the configuration in the claims in a manner satisfying the support requirement and other disclosure requirements**" is the same criterion used in the series of Eli Lilly decisions worldwide discussed below (German Federal Court of Justice, UK Supreme Court, and U.S. CAFC) when recognizing the application of the doctrine of equivalents to features (compounds) excluded by amendments during prosecution. International harmonization thus appears to be taking place.

(Note) In the UK Supreme Court case ([2017] UKSC 48), the amendments during prosecution responded to the examiner's objections under Articles 83 and 84 EPC (disclosure and clarity) and Article 123(2) EPC (added matter). In the CAFC case (Eli Lilly v. Hospira, August 9, 2019), the amendment was made to avoid an anticipation rejection over Arsenyan. The German Federal Court of Justice (X ZR 29/15) set aside the judgment that had rejected equivalence and remanded the case to the court of appeal.

One reasonable explanation for using the "filing date" as the reference date for foreseeability is that, even if the product/process was foreseeable at the "amendment date," it could not be added by amendment if not disclosed in the specification, because that would introduce new matter. Using the filing date, when it could have been included in the specification, is therefore rational. If, instead, the prosecution history showed that the product/process was foreseeable at the amendment date and disclosed in the specification, yet a more restrictive amendment was made, it might be possible to conclude on a different rationale that there was intentional exclusion and the fifth requirement was not satisfied.

As related background, the U.S. Supreme Court's May 2002 decision in Festo v. Shoketsu Kinzoku stated the following criteria: "(1) Where claims are narrowed during prosecution, prosecution history estoppel applies, whether or not the narrowing is intended to avoid prior art, so long as it is intended to satisfy a requirement of patent law (developing the U.S. Supreme Court's Warner-Jenkinson decision). (2) If the patentee cannot explain the reason for a narrowing amendment, it is presumed to have been made for a substantial reason related to patentability. (3) Even where prosecution history estoppel applies following claim narrowing, equivalence is not automatically excluded (= flexible bar). (4) Three alternative grounds

for rebuttal where prosecution history estoppel applies: (a) the subject matter was unforeseeable at the '**filing date**'*; (b) the underlying reason for the narrowing amendment bears only a tangential relation to the subject matter; or (c) there is a reasonable explanation for why the subject matter could not have been described." However, many subsequent CAFC judgments used the "**amendment date**" as the reference date for unforeseeability, and those subsequent judgments are said to have created the trend toward using that date. ("Prosecution History Estoppel, Equivalents at the Filing Date, and the Doctrine of Equivalents," Echi, Annual Report of the Japan Association of Industrial Property Law (2015).)

[Related Case: Third Requirement]

Tokyo District Court, 2016 (Wa) No. 7763, Self-Laminating Rotatable Cable Marker Label with a Split Portion <Shimasue>

***Only the third requirement (conceivability of replacement at the start of manufacture) was rejected.**

***Ease of replacement was rejected under a framework different from inventive-step analysis.**

"…The third requirement that a 'person skilled in the art' 'could readily have conceived of [the replacement] at the time of manufacture or other relevant act involving the accused product or process' differs from 'could easily have made the invention' based on publicly known inventions under Article 29(2) of the Patent Act or 'could readily have inferred' by a 'person skilled in the art' **under the fourth requirement. It requires a degree of ease such that every person skilled in the art can recognize it as if expressly recited in the claims—that is, as substantially identical** (see Tokyo District Court, October 7, 1998, 1991 (Wa) No. 10687, Hanrei Jiho No. 1657, p. 122). …

Regarding the configuration of the Defendant's Product, even if it was well-known technology in the field of labels attached to articles to form a nonlinear separation line, including a U-shaped line, and divide the label into multiple portions along that line (…), it is difficult to say that the configuration was so easy that every person skilled in the art would recognize it as if expressly recited in the claims of Invention 1 at Issue. …

The plaintiff argues that no motivation is required for the configuration in which the 'first adhesive region 16′' in the Defendant's Product fixes the label at two points at its two corners, because that configuration falls within the technical scope of Invention 1 at Issue. The issue here, however, is whether the specific configuration of the Defendant's Product relating to its differences from Invention 1 at Issue can readily be conceived from the wording of the claims. That specific configuration necessarily includes where within the label the 'first adhesive region' is located. Thus, the mere facts that the Defendant's Product has a portion capable of constituting the 'first adhesive region' of Invention 1 at Issue and that forming a U-shaped separation line is well-known technology are insufficient to say that the configuration of the Defendant's Product would be recognized as if expressly recited in the claims of Invention 1 at Issue."

[Related Cases: Fifth Requirement]

(1) UK Supreme Court, [2017] UKSC 48 (Actavis v. Eli Lilly)

A UK Supreme Court decision recognizing the doctrine of equivalents. **Although the claims were narrowed during European prosecution, the amendment was held to be intended to overcome an added-matter objection based on an impermissible intermediate generalization and merely to satisfy the amendment requirements.⇒** Equivalence established.

(2) German Federal Court of Justice, X ZR 29/15 (Actavis v. Eli Lilly)

An amendment distinguishing the subject matter from the prior art may indicate a selection decision excluding other configurations from protection. By contrast, such a selection decision ordinarily cannot be inferred from **an amendment made to meet formal requirements (added matter or clarity). ⇒ The judgment excluding equivalence was set aside, and the case was remanded for findings on equivalent effect, ease of identifying the substitute, and ot**her matters.

(3) U.S. CAFC / Eli Lilly v. Hospira (Fed. Cir. Aug. 2019)

During prosecution, Eli Lilly had unnecessarily narrowed claim 12 of the ’209 patent to “pemetrexed disodium salt,” whereas Hospira sought approval to market “pemetrexed ditromethamine salt.”

The U.S. Supreme Court’s Festo decision (2002) adopted a flexible bar and set out the following three grounds for rebutting the presumption of prosecution history estoppel arising from a narrowing amendment during prosecution.

①Equivalent may have been unforeseeable at the time of the application.

②The rationale underlying the amendment may bear no more than a tangential relation to the equivalent in question.

③Some other reason suggesting that the patentee could not reasonably be expected to have described the insubstantial substitute in question.

This CAFC decision is important as a case in which the presumption of prosecution history estoppel was rebutted before the U.S. CAFC and equivalence recognized for a claim narrowed during prosecution, on the ground of “no more than a tangential relation to the equivalent in question.”

This CAFC decision was probably not unrelated to the UK Supreme Court decision recognizing infringement under the doctrine of equivalents and the German Federal Court of Justice decision setting aside and remanding the judgment that had rejected equivalence in relation to family patents (the two cases above).

Japan too has recently seen a case recognizing infringement under the doctrine of equivalents for a limitation added by amendment: the Osteotomy Spreader case, Tokyo District Court, December 21, 2018, 2017 (Wa) No. 18184 <Presiding Judge Sato>, discussed below. (The appellate judgment, Intellectual Property High Court, 2019 (Ne) No. 10005 <Presiding Judge Tsuruoka>, found literal infringement.)

★In 2019, the CAFC recognized equivalence in three cases. Although some had wondered whether the U.S. doctrine of equivalents was dead, a signal of its revival may have been sent.

UCB, Inc. v. Watson Labs. Inc. (Fed. Cir. June 24, 2019)

Ajinomoto Co. v. USITC (Fed. Cir. Aug. 6, 2019)

Eli Lilly & Co. v. Hospira, Inc. (Fed. Cir. Aug. 9, 2019)

(4) Japan (Tokyo District Court, December 21, 2018, 2017 (Wa) 18184 <Presiding Judge Sato>)

“…Regarding the fifth requirement, the defendant argues as follows. Constituent feature E was added by the Amendment at Issue. The Written Opinion at Issue responding to the Notice of Reasons for Refusal states: ‘The present invention differs from the invention disclosed in Cited Document 1 … in comprising two sets of swinging members and in providing one swinging member with an engagement portion that engages the other.’ This can be understood as the plaintiff intentionally excluding from the patented invention a configuration, such as the Defendant’s Product, in which the engagement portion is a separate member. Therefore, infringement under the doctrine of equivalents is not established.

However, the Written Opinion at Issue contains statements including: ‘Cited Document 1 discloses a retractor assembly having a pair of jaws arranged to open and close through a rotatable connection at their ends’; ‘Such a configuration [court’s note: the configuration of the Invention at Issue] allows two sets of swinging members to open simultaneously, facilitating enlargement of an incision formed in a bone and preventing locally excessive pressing force on the cut surfaces of the incision’; ‘Merely combining two retractor assemblies detachably cannot yield the configuration of the present invention’; and ‘Cited Invention 1 provides no suggestion of the problem of reducing the pressing force acting on the cut surfaces of the incision, or of the action of the engagement portion in opening two retractor assemblies as an integrated unit.’

According to those statements, **the main point of the Written Opinion at Issue is to explain to the JPO examiner that Cited Reference 1 discloses a pair of swinging members, whereas the Invention at Issue combines two pairs of openable and closable swinging members and provides an engagement portion for engaging one swinging member with the other, enabling both to open simultaneously. The opinion contains no statement showing awareness of or suggesting the configuration of the engagement portion—that is, whether it is formed as part of the swinging member or by a member separate from it.** Accordingly, the statement identified by the defendant, 'comprising two sets of swinging members and providing one swinging member with an engagement portion that engages the other,' merely describes the configuration of the Invention at Issue in the context of that explanation. It cannot establish that, when constituent feature E was added by the Amendment at Issue filed together with the opinion, the plaintiff intentionally excluded from the claims a configuration in which the engagement portion is a member separate from the swinging member."

https://www.nakapat.gr.jp/ja/legal_updates_jp/%E3%80%90%E7%89%B9%E8%A8%B1%E2%98%85%E2%98%85%E2%98%85%E3%80%91%E6%9D%B1%E4%BA%AC%EF%BC%88%E5%9C%B0%E8%A3%81%E3%80%81%E9%AB%98%E8%A3%81%EF%BC%89%E3%81%A7%E5%88%9D%E3%82%81%E3%81%A6%E3%80%81%E8%A3%9C/?fbclid=IwAR0jJ058kRFhMKK_KcJESCo89MkhyUawJwH-o6Lvtp-vMViNi5NPrILLTVY

(5) May 2002, U.S. Supreme Court, "Festo v. Shoketsu Kinzoku"

(1) Where claims are narrowed during prosecution, prosecution history estoppel applies, whether or not the narrowing is intended to avoid prior art, so long as it is intended to satisfy a requirement of patent law (developing the U.S. Supreme Court's Warner-Jenkinson decision).

(2) If the patentee cannot explain the reason for a narrowing amendment, it is presumed to have been made for a substantial reason related to patentability.

(3) Even where prosecution history estoppel applies following claim narrowing, equivalence is not automatically excluded (= flexible bar).

(4) Three grounds for rebuttal where prosecution history estoppel applies: (a) the subject matter was unforeseeable at the time of the application; (b) the underlying reason for the narrowing amendment bears only a tangential relation to the subject matter; or (c) there is a reasonable explanation for why the subject matter could not have been described.**⇒ On remand: prosecution history estoppel is a question of law for the judge.**

[Excerpts from Related Judgments: Recent Cases Recognizing Infringement under the Doctrine of Equivalents]

(1) IP High Court, 2009 (Ne) No. 10006, Hollow Golf Club Head (Iimura)

(1) Replaceability

…The purpose and effects (or problem-solving principle) of using a "stitching member (made of fiber-reinforced plastic)" are to increase the joint strength between the metal shell member and the fiber-reinforced-plastic shell member. … In the Defendant's Product, molding by heating and pressing with FRP lower shell member 9 applied is performed not only at the bonding interface of the metal shell member but also on the opposite side. Strip 8 is therefore integrally joined to the fiber-reinforced-plastic shell member (FRP upper shell member 9) also on the side opposite the metal shell member's bonding interface. … Thus, strength need not be secured by passing strip 8 repeatedly through the through-hole provided in the metal shell member. … Because the purpose and effects (or problem-solving principle) are common, replaceability exists.

(2) Ease of replacement …

(3) Whether the difference is a non-essential part

The purpose and effects of the Invention at Issue are … to increase the joint strength between the metal shell member and the fiber-reinforced-plastic shell member. In light of the claims and the detailed description in the Specification at Issue, the invention seeks to achieve that purpose by providing a through-hole in the joint portion of the metal shell member and passing a fiber-reinforced-plastic member through it. The important part for solving the problem lies in the configuration of joining "said fiber-reinforced-plastic shell member and said metal shell member" by passing the member "through said through-hole" to "the bonding-interface side of said metal shell member with said fiber-reinforced-plastic shell member and the opposite side." … "Being a stitching member" cannot be regarded as the central, characteristic part of the technical concept underlying the means for solving the problem addressed by the Invention at Issue.

(2) IP High Court, 2010 (Ne) No. 10014, Round Cover for Underground Structures (Nakano, Shoji)

(d) Whether the first requirement for applying the doctrine of equivalents is satisfied

The effect that "when closing the cover, the cover body can be smoothly accommodated within the receiving frame merely by dragging it with a crowbar or pushing it from behind" (Effect (1) at Issue) … and the effect that "rattling of the cover body can be prevented, as can entry of earth, sand, rainwater, and the like into the underground structure" (Effect (2) at Issue) … The respective convex curved portions of the cover body and receiving frame play the most important role in achieving Effect (1). … The appellant's argument that "the receiving frame need only have a recess, and a concave curved portion is unnecessary" is found justified, and the receiving frame's "concave curved portion" is not an essential part of the Invention at Issue. … In the description of the Specification …, whether the recess of the receiving frame is a "curved portion" is not at issue for producing Effect (2). … Thus, for producing Effect (2) as well, the receiving frame's recess being a "curved portion" is not an essential part.

(e) Whether the second requirement for applying the doctrine of equivalents is satisfied

…Although the demonstration in court depends greatly on the demonstrator's skill in opening and closing, Defendant's Product B is also found to produce Effect (1) to a certain degree, and there is no substantial difference depending on whether the receiving frame has a "concave curved portion" or a "recess." …

(3) IP High Court, 2010 (Ne) 10089, Method and Apparatus for Encrusting and Forming Food (Takizawa)

(c) Requirement (1) for infringement under the doctrine of equivalents

…Invention 1 at Issue is characterized by using the already provided sealing shutter to adjust the position of the outer skin material—a step closely related to, and important for, the subsequent bowl-forming and sealing steps—and by achieving that important step with a simple configuration without providing separate means.

In Invention 1 at Issue, relative movement bringing the shutter pieces and support member closer to the nozzle member and dough-holding member is important, but which side is raised or lowered is not technically important. Accordingly, the difference that Invention 1 at Issue lowers the nozzle member and dough-holding member toward the shutter pieces and support member, whereas Defendant's Method 2 raises the shutter pieces and support member toward the nozzle member and dough-holding member, is not an essential part of Invention 1 at Issue.

(d) Requirement (2) for infringement under the doctrine of equivalents

Defendant's Method 2, which does not lower the pressing member but instead raises the shutter pieces and support member toward the nozzle member and dough-holding member, rather than lowering the nozzle member and dough-holding member toward the shutter pieces and support member, can still adjust the position of the outer skin material so that it fits in a predetermined position. It produces the same effects as

Invention 1 at Issue: correcting variations in shape and positional displacement of the outer skin material in advance to permit more reliable forming ([0008], [0013]); placing the outer skin material more stably and holding it securely ([0011]); and greatly simplifying the apparatus configuration ([0012]). …

(4) Tokyo District Court, 2011 (Wa) No. 8085, Level for a Washing Machine (Takano)

To solve a technical problem not achievable by the prior art—providing a washing-machine level requiring no separate mounting parts, capable of inexpensive and accurate installation even on an uneven contact surface, and offering good visibility—Invention 4 at Issue integrally forms the case and engagement portion and integrally provides an external case outside the case that projects below both the case and the lid. This is found to be the characteristic part underlying the means of solution distinctive to Invention 4 at Issue.

Accordingly, … the configuration "the inner bottom surface of the mounting portion" is not an essential part of Invention 4 at Issue. …

The defendants argue that Invention 4 at Issue solves the problem of improving installation-level accuracy by bringing the lower end surface of the external case into contact with the inner bottom surface of the mounting portion as a reference surface. They therefore assert that the configuration "the inner bottom surface of the mounting portion" also embodies the substantive value of Invention 4 at Issue and is an essential part. However, as stated above, the inner bottom surface of the mounting portion is a configuration that gave rise to the technical problem because its unevenness impaired installation accuracy, not a configuration that solved the problem.

(5) IP High Court, 2013 (Ne) No. 10017, Open-Type Fermentation Treatment Apparatus (Shimizu)

(1) Essential part (first requirement)

…To eliminate problems such as outward scattering and collapse of the deposited material during scooping, the front and rear pair of plate-shaped scooping members are each directed inward at a predetermined angle relative to the axial direction of the rotating shaft (toward the long wall of the open fermentation tank). The outside of the inwardly inclined member contacts the outer-edge deposit on the long open-face side of the material accumulated ahead of it and scoops it diagonally inward. Arranging the inclined plates inward at predetermined angles in this manner is the characteristic part underlying Corrected Invention 2 at Issue. …

Because the agitator of Corrected Invention 2 at Issue rotates forward or backward as it travels reciprocally, the scooping portion may contact the outer-edge deposit in either the forward or backward direction perpendicular to the rotating shaft. The material must be scooped in either case. For this purpose, scooping members are arranged front and rear and inclined relative to the front-rear direction, with the outer surface of the front inclined plate facing diagonally forward to one side and the outer surface of the rear inclined plate facing diagonally backward to that side. Thus, the configuration in which the scooping members are inclined in both front and rear directions is also a characteristic part underlying Corrected Invention 2 at Issue. …

By contrast, Corrected Specification 2 at Issue contains no explanation of the technical significance of using two plates for the scooping member. … What matters is that the outer surfaces of the inclined plates contact the outer-edge deposit during forward and reverse rotation respectively. There is therefore no particular technical significance in the scooping member of Invention 2 at Issue being composed of two plates. There is no technical difference between directly welding two members into a V shape, as described in Corrected Specification 2 at Issue, and bending a single member into a V shape, so this point is not an essential part. Moreover, … the front and rear inclination angles need only be 10°–80° relative to the central axis of rotating shaft 5a, including a reverse-chevron shape. The scooping member is not limited to a flat plate, but need only contact the outer-edge deposit and scoop it inward. In light of these matters, its being formed from flat plates is likewise not an essential part.

(6) Tokyo District Court, 2012 (Wa) No. 31523, Flow-Control Valve (Hasegawa)

…Whereas the Invention at Issue installs the flow-control disk inside the water-flow chamber through a bushing fitted inside the coupling fitting …, Defendant's Product 3 … adopts a configuration in which the disk is installed in the chamber by press-fitting it into a V-shaped taper formed in the coupling fitting without a bushing. … It therefore does not literally satisfy the limitation.

Even the detailed description in the specification contains no disclosure of its specific configuration or the effects of providing a bushing. Moreover, … in light of the invention's technical significance … of enabling a single flow-control disk to accommodate diverse flow control by installing it inside the water-flow chamber, the disk must be fixed within the chamber of the above shape so that it remains in place without falling from the lower end and without water leaking between the disk and the chamber. … Fixing the disk to the chamber can be done either by directly joining them or by indirectly joining them through another member. The Invention at Issue adopts the latter, but the technical significance of interposing a bushing is not described in the specification. Furthermore, when manufacturing products, reducing the number of parts to lower manufacturing costs or reduce steps and shorten production time is something a person skilled in the art should naturally consider. (★There are also many cases rejecting the third requirement where added features produce new effects.)

Thus, a person skilled in the art reading the claims and detailed description of the Invention at Issue would be expected to attempt a design modification omitting the bushing and joining the flow-control disk directly to the water-flow chamber. As shown in the embodiment, the chamber cross-section and the disk are circular, and water flows from the upper end toward the lower end. It would therefore have been readily conceivable to form the inside of the coupling fitting as a V-shaped taper narrowing toward the lower end and directly press-fit the disk-shaped flow-control member into its circumferential portion, thereby fixing the two so that the disk neither falls from the lower end nor permits water leakage between the disk and the chamber.

(7) Osaka District Court, 2014 (Wa) No. 5210, Facial Mask Sheet (Takamatsu)

(a) Non-essential part

…Conventional sheets also had no cuts over the upper part of the nose …, and the prior art already achieved coverage of the region near the inner corners of the eyes corresponding to the upper nose. By contrast, the technical problem addressed by the Patented Invention at Issue was to fit snugly even over the nasal wings of the nose, the most prominent part of the face, because conventional facial mask sheets left large uncovered gaps around the nasal wings and the corresponding sheet portions lifted away. The Patented Invention at Issue arranges perforation-like cut lines within a "substantially trapezoidal region." Together with the nonwoven material's tendency to stretch laterally, this allows the sheet naturally to stretch and spread laterally along the nasal bridge and the angle of the nose, fitting snugly over the nasal wings without gaps.

Accordingly, the distinctive effect of the Patented Invention at Issue lies in achieving coverage of the nasal wings, difficult in the prior art, by arranging multiple rows of perforation-like cut lines in the nose portion. Thus, the absence of cut lines in the Defendant's Product in the area from the height of the inner eye corners to slightly below them is not a difference belonging to the essential part underlying that distinctive effect. …

(b) Replaceability

…The Defendant's Product is found to fit closely over the entire nose, including the nasal wings, even without perforation-like cut lines in the area from the height of the inner eye corners to slightly below them. It therefore can achieve the purpose of the Patented Invention at Issue and produces the same effects.

(8) Intellectual Property High Court (Grand Panel), 2015 (Ne) 10014, Maxacalcitol

<Second requirement> Although the carbon skeleton corresponding to Z in the Corrected Invention, within starting material A and intermediate C of the Appellants' Method, is a trans-vitamin D structure, whereas the carbon skeleton of Z in the starting material … and intermediate … of the Corrected Invention is a cis-vitamin D structure, the starting materials and intermediates in both methods perform the same function and effect: producing maxacalcitol by reacting a 20-position alcohol compound with a vitamin D structure with the same epoxy hydrocarbon compound, thereby proceeding through an intermediate consisting of a vitamin D structure into which a side chain having an epoxy group has been introduced through an ether bond in a single step. Replacing the above starting material and intermediate having a cis-vitamin D structure in the Corrected Invention with those having a trans-vitamin D structure in the Appellants' Method is therefore found to achieve the same purpose and produce the same effects as the Corrected Invention.

The appellants argue that the only effect described in the corrected specification is a reduction in the number of steps; that the effect of the Corrected Invention is to shorten, relative to the prior art, the steps for introducing the side chain of maxacalcitol when starting from a cis compound; and that efficiency through step reduction should be determined by the total number of manufacturing steps, so methods with different total numbers of steps do not have the same effects. However, … for a patented invention whose specification has no "Effects of the Invention" description, it is inappropriate to infer a limited set of effects solely by comparison with part of the prior art. … The Corrected Invention also encompasses a step converting a steroid ring structure into a vitamin D structure and does not particularly recognize a difference (reduction) in the total number of steps, including the presence or absence of that conversion step, as its distinction from the prior art. Its effect therefore cannot be identified as reducing the total number of steps required to produce a target substance such as maxacalcitol relative to the prior art.

(9) Osaka District Court, 2014 (Wa) No. 4916, Forefoot Support Pad (Takamatsu)

(2) First requirement (non-essential nature of the differing part)

In light of the technical significance of the Device at Issue, its essential effects lie in fitting a forefoot support pad beneath the bases of the toes, raising the toe pads and bases of the second through fourth toes to form a transverse arch, maintaining the arch of the foot and thus the longitudinal arch, and supporting the body at three points: the toe pads and ball-contact portions of the big and little toes, and the heel. … Because the big and little toes contact the ground and support the body, fitting the pad between the upper edges of their ball-contact portions and the lower edges of their toe pads is not indispensable to achieving those effects. … Thus, the difference between constituent feature (4) of the Device at Issue and the Defendant's Product—whether the pad's horizontal portion reaches the area up to the lower edge of the little toe pad—is not a difference in the essential part underlying the effects of the Device at Issue. … Accordingly, … the difference concerning the horizontal portion extending to the lower edge of the little toe pad and the upper surface of that portion and the side surface of the third convex portion being gently curved to fit closely beneath the base of the little toe … must be regarded as outside the essential part underlying the distinctive effects of the Device at Issue.

⇒ This judgment too identifies, in assessing the first requirement, the portion underlying the device's distinctive effects as the essential part. Its relationship between the first and second requirements is consistent with the Maxacalcitol Grand Panel decision.

(10) Tokyo District Court, 2015 (Wa) No. 6812, Juice-Extracting Juicer (Hasegawa)

According to the Specification at Issue, the presence of the pressure-discharge passage is not directly related to the problem the invention seeks to solve. Nevertheless, … the passage is intended to prevent some juice produced as ingredients are finally compressed and dehydrated at the bottom of the mesh drum from flowing over the waterproof cylinder and outside the housing. There is therefore room to regard

forming a juice-discharge passage at the lower edge of the waterproof cylinder on the bottom surface of the housing as an essential part of the invention. However, achieving that effect only requires the passage to exist at the lower edge of the waterproof cylinder; the effect does not differ according to the members used to form it. It is therefore appropriate to construe the differing portion as not an essential part of the Invention at Issue.

⇒ As one reason for finding the first requirement satisfied, this judgment also notes that the "pressure-discharge passage," absent from the Defendant's Product, is not directly related to the problem addressed by the invention, consistent with the Maxacalcitol Grand Panel decision. Even if the features relating to the difference between the invention and the accused product are connected with the invention's effects, the judgment maintains its conclusion that they are not an essential part because the effects "do not differ according to the members used to form [the passage]."

(11) Tokyo District Court, 2013 (Wa) 7478, Method for Manufacturing Semiconductor Chips

<First requirement> …The Specification and Other Documents at Issue state that there is no particular restriction on the technique for forming the "second dividing groove," and that etching, dicing, scribing, and other techniques may be used. Scribing is merely described as particularly preferable for reasons such as permitting a narrow line width. … Thus, the method of forming the "second dividing groove" is not particularly limited.

Nor are there circumstances in this case suggesting that the problem described in the Specification and Other Documents at Issue as unresolved by the prior art is objectively insufficient in light of the prior art at the filing date. … It is appropriate to find that the characteristic part constituting the invention's distinctive technical concept, absent from the prior art, lies in the following: when cutting into chips a wafer having a gallium nitride compound semiconductor laminated on a sapphire substrate, a first dividing groove—that is, a linear portion facilitating cutting—is formed by etching on the semiconductor-layer side, a second dividing groove—that is, a linear portion facilitating cutting—is formed by some method on the sapphire-substrate side, the positions of the two are aligned, and the line width on the sapphire-substrate side is made narrow. Whether the second dividing groove on the sapphire-substrate side, namely the linear portion facilitating cutting, is a hollow groove, and which method is adopted to form that linear portion, do not constitute that characteristic part.

(12) Tokyo District Court, 2017 (Wa) No. 18184, Osteotomy Spreader (Sato) *First-instance judgment

<Second requirement> The defendant argues that the Invention at Issue's effects include automatic disengagement from the other swinging member as one swinging member is closed, and that the Defendant's Product does not produce the same effects because merely closing one swinging member does not automatically disengage it from the other. However, the effect stated in the Specification and Other Documents at Issue is that "the present invention facilitates insertion of an implant while maintaining the incision in an enlarged state" (paragraph [0012]). This effect can be achieved by removing one pair of swinging members after enlarging the incision with two pairs. Automatic disengagement is not included in the invention's effects. …

<Fifth requirement> The main point of the Written Opinion at Issue is to explain to the JPO examiner that Cited Reference 1 discloses a pair of swinging members, whereas the Invention at Issue combines two pairs of openable and closable swinging members and provides an engagement portion for engaging one swinging member with the other, enabling both to open simultaneously. The opinion contains no statement showing awareness of or suggesting whether the engagement portion is formed as part of the swinging member or by a separate member. Accordingly, … that statement cannot establish that, when constituent feature E was added by the Amendment at Issue filed together with the opinion, the plaintiff intentionally excluded from the claims a configuration in which the engagement portion is a member separate from the swinging member.

(13) Tokyo District Court, 2017 (Wa) No. 29228, Fluid Supply Apparatus and … Program (Shibata)

The Defendant's Fuel-Dispensing Apparatus adds an amount to the storage medium after fueling based on the difference between the selected and actual fuel quantities. In substance, this can be described as settling after fueling against the amount deducted before fueling. …

In Invention 1 at Issue, settlement after fluid supply is performed by subtracting the amount corresponding to the flow quantity from the amount of the pre-supply deposit data and adding the resulting difference to the monetary-amount data. In the Defendant's Fuel-Dispensing Apparatus, the difference between the selected and actual fuel quantities is measured and multiplied by the unit price of fuel to determine the refund. Each invention has calculation means and payment-settlement means for performing those operations. However, these are differences in how, upon completion of fluid supply, the difference between the initially deposited amount and the amount corresponding to the fuel actually supplied is calculated. In light of the foregoing, they cannot be regarded as the characteristic part constituting the distinctive technical concept of Invention 1 at Issue that is absent from the prior art.

(14) Tokyo District Court, 2017 (Wa) No. 32839, Beauty Device (Tanaka)

<First and second requirements> In light of the technical concept of the Invention at Issue, even where the shaft holes in the branched portions do not communicate with the recess in the handle body, configuring the handle from a handle body having a recess and a handle cover covering that recess still solves the technical problem arising from the deficiencies of the conventional configuration. Replacing this feature therefore cannot be said to create a different overall technical concept from the Invention at Issue. Moreover, even a noncommunicating configuration without "communicating shaft holes," as in the New Defendant's Product, produces the same effects as the Invention at Issue: maintaining high molding accuracy and strength of the handle while improving assembly workability of the beauty device. Thus, the differing part between the Invention at Issue and the New Defendant's Product is not an essential part of the invention (first requirement satisfied), and replacing the invention's configuration with that of the New Defendant's Product still achieves the invention's purpose and produces the same effects (second requirement satisfied). …

<Fourth requirement> Shine has a configuration entirely different from the New Defendant's Product. Compared with that product, it must be evaluated as based on a different technical concept with an entirely different problem-solving principle.

(15) Osaka District Court, 2019 (Wa) No. 3273, Learning Aid <Sugiura>

Considering the Exhibit Ko 11 Invention and the Exhibit Otsu 6 Invention in addition to the prior art described in the Specification at Issue, the following aspects of the Invention at Issue were also present in the prior art: a learning aid comprising a computer for memorizing an original image having a corresponding word or phrase by associating the image with that word or phrase; the computer includes a recording unit (image file FV) storing multiple sets of image data, each consisting of the original image (corresponding to complete character 22 of the Exhibit Otsu 6 Invention; hereafter in this paragraph, parentheses identify corresponding features of that invention) and a related image (part-related animation 24); means for selecting image data to display from the multiple sets stored in the recording unit (reading the English-word data for one section as one unit); image-display means (display 7) for sequentially displaying the original image and its related image using the selected data; a recording unit (audio file FA) storing audio data of words or phrases corresponding to the original image and related image (English-word audio data and associative-sentence audio data, respectively); means for selecting the audio data of those words or phrases from the recording unit (reading the English-word data for one section as one unit); and means for playing the selected audio data (speaker 6); and the image-display means displays the original image and related image in synchronization with playback of the corresponding words or phrases (synchronized output processing).

On the other hand, complete character 22 and part-related animation 24 in the Exhibit Otsu 6 Invention do not have a relationship that can be described as an original image; a first related image having an outline similar to, or suggestive of, the original image and a corresponding word or phrase; and a second related image having an outline similar to, or suggestive of, both the original image and the first related image and a corresponding word or phrase. Their playback order is also complete character 22 followed by part-related animation 24, not first related image, second related image, and original image. In the Exhibit Ko 11 Invention as well, although the kanji character, ancient character, and pictograph have mutually similar outlines, their display order is not prescribed, no words or phrases correspond to the ancient character and pictograph, and the recited mnemonic does not include words or phrases corresponding to them.

Accordingly, the following aspects of the Invention at Issue are not described in either Exhibit Ko 11 or Exhibit Otsu 6, let alone in the prior art described in the Specification at Issue: recording on an image-set recording medium, as one unit of an image set, a set consisting of an original image, a first related image having an outline similar to or suggestive of the original image and a corresponding word or phrase, and a second related image having an outline similar to or suggestive of the original image and the first related image and a corresponding word or phrase; displaying the images on the image-display means in the order of first related image, second related image, and original image; recording on an audio recording medium audio data consisting of the word or phrase corresponding to the first related image, the word or phrase corresponding to the second related image, and the word or phrase corresponding to the original image, playing it through audio-playback means, and displaying the first related image, second related image, and original image in synchronization with playback of their corresponding words or phrases.

Those points must therefore be regarded as the essential parts of the Invention at Issue.

Plaintiff (patentee): Ajinomoto Co., Inc.

Defendant (alleged infringer): CJ Japan Corp.

[Patent ★★★] (1) A case finding infringement under the doctrine of equivalents for a method excluded by an amendment responding to a lack-of-inventive-step rejection (consistent with the global tendency to apply the flexible bar flexibly). (2) An “offer for transfer” was established although the transferor and the person making the offer differed and the “transfer” occurred abroad. — NAKAMURA & PARTNERS (nakapat.gr.jp)

★ Decisions affirming and denying directors' liability under Article 429(1) of the Companies Act in intellectual property litigation

Original Ameblo publication: 2022-03-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12731806502.html

Osaka District Court, 2019 (Wa) 3277 [Ground Reinforcement Method] [Navigation Device]

* Liability of a (nominal) director under Article 429(1) of the Companies Act was affirmed.

“Even a nominal director owes a duty to monitor and supervise the representative director ...; therefore, there was neglect of duty, and at least gross negligence is established in that regard.”

=Osaka District Court, 2019 (Wa) 5444 [Carbon Dioxide-Containing Viscous Composition]

* The defendant went bankrupt after the Grand Panel judgment. The director's liability under Article 429(1) of the Companies Act was affirmed.

“... Even after receiving a warning of patent infringement, Defendant P3 relied principally on explanations from NeoChemir, the manufacturer of Defendant's Product 14, and, without taking any of the approaches examined in (1), items (i) through (iv), above, continued the tort of patent infringement by selling Defendant's Product 14 until the court disclosed its provisional assessment, thereby causing damage to the plaintiff. Accordingly, P3 breached the duty of care of a prudent manager as a director ....”

※Tokyo District Court, 2019 (Wa) 30282 (an Unfair Competition Prevention Act case) also affirmed the director's liability under Article 429(1) of the Companies Act.

※Tokyo District Court, 2016 (Wa) 2720 <Shimasue> “Foreign Matter Removal Machine for Raw Seaweed”

⇒ Joint tort liability of the defendant's wholly owning parent company and the defendant director's liability under Article 429(1) of the Companies Act were denied. “The fact that settlement negotiations were underway in the prior litigation concerning the old products ... cannot be regarded as a circumstance supporting bad faith or gross negligence.”

Companies Act, Article 429 - Wikibooks

European Patent Practice (1) <Procedure> (From the lecture transcript of German patent attorney Kan Hasegawa)

Original Ameblo publication: 2022-03-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12731995194.html

From the lecture transcript of German patent attorney Kan Hasegawa

European Patent Practice (1) <Procedure>

On entry into the European phase,

• Not amending the description.

⇒ Fees are calculated based on the number of English-language pages and become higher.

• Not amending the claims with patentability in mind.

⇒ The results of the international search are not referred to very much.

• Prove the assignment of the priority right.

• File divisional applications early.

⇒ Maintenance annuities are calculated from the filing date of the parent application.

Profile | Random Notes on European Intellectual Property Practice (hasegawa-ip.com)

European Patent Practice (2) <Claim Drafting> (From the lecture transcript of German patent attorney Kan Hasegawa)

Original Ameblo publication: 2022-03-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12732158270.html

From the lecture transcript of German patent attorney Kan Hasegawa

European Patent Practice (2) <Claim Drafting>

(1) Prepare numerous dependent claims.

⇒ This can prevent the inefficiency of repeated rejections following amendments and new references.

(2) Multiple-multiple dependent claims

⇒ Europe is strict about added matter.

⇒ Even claim 2 + claim 3 may be found to constitute added matter.

⇒ Even for Japanese applications filed from April onward, including multiple-multiple-claim-like language in the description can reduce concerns about added matter in Europe.

(3) As a rule, only one independent claim per category is permitted. (The exceptions also merit study!!)

⇒ Possible drafting approaches: A + (b1 or b2), A + B

(4) Avoid references to external tangible objects.

⇒ References to external tangible objects tend to be disregarded.

[Takaishi] In Japan, I would think that these become features defining the invention in a subcombination claim. A difference in practice.

(5) Do not write effects into the claims.

⇒ An effect incorporated into a claim is unlikely to become a feature defining the invention and instead raises concerns about an irremediable failure to meet the enablement requirement.

[Takaishi] In Japan, effects incorporated into claims often become features defining the invention, so practice differs.

(6) Keep the features in an independent claim to a minimum.

⇒ They are difficult to delete later.

⇒ Features unrelated to the problem of the invention can sometimes be removed, but the approach is stricter than in Japan.

(7) Do not state numerical ranges as separate upper and lower limits. (For future amendments)

“5–20 wt%, preferably 10–15 wt%”

permits amendment to either

“10–20 wt%” or

“5–15 wt%.”

but

“The lower limit is 5 wt%, preferably 10 wt%. The upper limit is 20 wt%, preferably 15 wt%”

does not permit those amendments.

European Patent Practice (3) <Amendments> (From the lecture transcript of German patent attorney Kan Hasegawa)

Original Ameblo publication: 2022-03-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12732514394.html

From the lecture transcript of German patent attorney Kan Hasegawa

European Patent Practice (3) <Amendments>

Conditions under which “intermediate generalization” (= an amendment abstracting an embodiment and adding it to a claim) is permitted

- The feature is not related to the other features of the embodiment.

- The overall disclosure justifies the generalized isolation of the feature and its introduction into the claim.

[Takaishi] In Japan, too, for “intermediate generalization” (= an amendment abstracting an embodiment and adding it to a claim), the tendency is that portions unrelated to the problem of the invention may be left out, but portions related to that problem may not.

[Patents] Added Matter and the Problem of the Invention at Issue (Expansion Strategies When Filing Divisional Applications) - YouTube

---

In Europe, amendments based solely on drawings are treated strictly.

[Takaishi] In Japan, too, for amendments based solely on drawings, both the question of whether the feature can be discerned at all and the limits of abstraction (generalization to a broader concept) are fairly strict. (This parallels identification of a cited invention from drawings.)

[Patents / Inventive Step / Novelty] <Identification of a Cited Invention> Can a Cited Invention Be Read from the Drawings in a Publication? (Shape, Relative Size, Positional Relationships, Dimensions, Arrangement, Direction, Presence) - YouTube

I successfully passed the 160th Unified Grade 2 Bookkeeping Examination (paper-based, February 27, 2022). (78 points)

Original Ameblo publication: 2022-03-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12732541808.html

I successfully passed the 160th Unified Grade 2 Bookkeeping Examination (paper-based, February 27, 2022). (78 points)

A perfect score in industrial bookkeeping.

In commercial bookkeeping,

I got partial credit on Questions 2 and 3 as intended.

I thought I had a perfect score on Question 1, but ...

⇒ I will compare my answers when the answers are released.

I studied using Masayuki Fukushima's YouTube videos and repeatedly worked through practice problems.

Masayuki Fukushima's YouTube videos go beyond the level needed to pass, but when you consider why you are taking the examination, I do not think it is right to discard everything unnecessary for passing.

To be honest, I passed Grade 3 using technique alone, so this time I reflected on that and went back to watch the Grade 3 YouTube videos.

As I also wrote on the day, the actual examination is far easier than TAC's predicted questions, and time is not tight.

In fact, I also tried taking the computer-based examination on March 5 (and passed that one too). Again, it was far easier than TAC's predicted questions, and time was not tight.

Everyone,

please do not be discouraged if TAC's predicted questions defeat you!!

Some examinees may have lost heart because the predicted questions are too difficult. But the actual examination is not that difficult, so please keep trying without giving up!!

(I suspect that although the time was shortened from 120 minutes to 90 minutes, the level of the predicted questions was not lowered. And because past papers after the time reduction have not been released, the available information seems likely to be skewed. However, the pass rate for the most recent unified examination has not fallen, so it would not make sense unless the questions had become easier—and that was indeed the case.)

And if you study until you pass, you will pass, so keep at it!!

Next, Grade 1 bookkeeping ... is not what I will be doing.

Next, I will work toward making a film.

[Bookkeeping YouTuber?] Masayuki Fukushima - YouTube

https://www.youtube.com/channel/UCGDec349YIziUytZzc3d7Yg

European Patent Practice (4) <Pitfalls in Novelty> (From the lecture transcript of German patent attorney Kan Hasegawa)

Original Ameblo publication: 2022-03-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12733229989.html

From the lecture transcript of German patent attorney Kan Hasegawa

European Patent Practice (4) <Pitfalls in Novelty>

(1) Few exceptions to loss of novelty

⇒ There is no equivalent of Article 30(2) of the Japanese Patent Act!!

(2) Intended use

⇒ In principle, it does not limit the claim!

[Takaishi] Practice differs greatly from Japan.

Enforcement of “Use Inventions” (Direct and Indirect Infringement) (jpaa.or.jp)

(3) Selection inventions ★

⇒ Novelty is not recognized unless the selection is from two or more lists!!!!

[Takaishi] Practice differs greatly from Japan. In South Korea, too, a recent Supreme Court judgment took the same approach as Japan.

Supreme Court Judgment Holding That Inventive Step Is Not Denied Even for a Selection Invention If Difficulty in Arriving at Its Configuration Is Established | Case Law Database - Intellectual Property Information - South Korea - Asia - By Country/Region - JETRO (jetro.go.jp)

(Note) The EPO Guidelines for Examination (2023 edition, G-VI, 8; G-VI, 7 from the 2024 edition onward) state that a selection from a single list of specifically disclosed elements does not confer novelty, and that, where a selection from two or more lists of a certain length has to be made, the resulting combination not specifically disclosed in the prior art confers novelty. Novelty of a sub-range selected from a numerical range is assessed under separate criteria.

(4) Self-collision

⇒ There is no equivalent of Article 29-2 of the Japanese Patent Act!

(Note) Article 54(3) EPC includes in the state of the art, for the assessment of novelty, the content of European patent applications filed earlier and published later. However, there is no provision corresponding to the proviso to Article 29-2 of the Japanese Patent Act (the exception where the applicant is the same). An applicant’s own earlier application may therefore destroy the novelty of its own later application (self-collision).

<Narrowing Amendments During Prosecution and the Doctrine of Equivalents>

Original Ameblo publication: 2022-03-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12733231414.html

<Narrowing Amendments During Prosecution and the Doctrine of Equivalents>

On the basis of the flexible bar, the tendency to recognize infringement under the doctrine of equivalents for limitations added by an amendment responding to a notice of reasons for rejection is a worldwide trend!

⇒ Pro-patent

Two Japanese decisions

UK Supreme Court, German Federal Court of Justice, and US CAFC “Eli Lilly cases”

[Patents ★] <Narrowing Amendments During Prosecution and the Doctrine of Equivalents (Worldwide Trends in Case Law and Introduction to Japanese Decisions)> - NAKAMURA & PARTNERS (nakapat.gr.jp)

IP High Court, 2019 (Gyo-Ke) 10046 <Otaka> [Circuit Breaker Mounting Structure] (1) Inventive step: yes; (2) Divisional application requirements: satisfied

Original Ameblo publication: 2022-03-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12733232469.html

IP High Court, 2019 (Gyo-Ke) 10046 <Otaka> [Circuit Breaker Mounting Structure] (1) Inventive step: yes; (2) Divisional application requirements: satisfied

(1) The small size of the components was a reason for finding non-obviousness!!

“... It is difficult to consider that it would have been easy to conceive of additionally providing operating handles, projections, etc. on small components such as leaf springs and branch switches, in a structure that maintains their precision.”

(2) The matter in the divisional application is not directly related to the problem of the invention.

⇒ A divisional application generalizing the express disclosure in the parent application's original description, etc. to a broader concept is OK.

“Which part is the claw or the recess, and the specific manner of fitting ... are not directly related to solving the problem.”

IP High Court, 2020 (Gyo-Ke) 10103 [Multicolor Penlight] <Shoji>

Original Ameblo publication: 2022-03-23

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12733403586.html

IP High Court, 2020 (Gyo-Ke) 10103 [Multicolor Penlight] <Shoji>

* The trial decision incorrectly identified the problem inherent in the primary reference.

* “Color rendering” in the primary reference and “color rendering” in the secondary reference have different meanings.

⇒ They do not provide a basis for motivation to combine.

“The ‘color rendering’ ... identified by the trial decision in relation to the problem of the Exhibit Ko 1 invention differs from the ‘color rendering’ identified as a technical matter disclosed in Exhibit Ko 2, namely ‘color rendering’ in the ordinary sense of whether the color of an illuminated object is close to its color when viewed in natural light.”

(Excerpts from the judgment)

... Exhibit Ko 1 cannot be found to disclose a problem inherent in the yellow color emission itself described as ‘yellow.’ ...

Since the Exhibit Ko 1 invention and the technical matter disclosed in Exhibit Ko 2 cannot be said to belong to exactly the same technical field, but only to closely related fields, to say that it would have been easy to arrive at Invention 1 at Issue by adopting the technical matter of Exhibit Ko 2 in the Exhibit Ko 1 invention requires corresponding motivation to adopt that technical matter ....

As a premise for finding motivation to adopt the technical matter disclosed in Exhibit Ko 2 in the Exhibit Ko 1 invention, and for finding that Invention 1 at Issue could readily have been conceived by doing so, the trial decision found that the Exhibit Ko 1 invention had a problem inherent in the yellow color emission itself described as “yellow” ... and that the Exhibit Ko 1 invention had the problem of improving color rendering in common with Exhibit Ko 2 .... However, ... the trial decision's finding that the Exhibit Ko 1 invention has a problem inherent in the yellow color emission itself described as “yellow” is incorrect; furthermore, the “color rendering” ... identified by the trial decision in relation to the problem of the Exhibit Ko 1 invention differs from the “color rendering” identified as a technical matter disclosed in Exhibit Ko 2, namely “color rendering” in the ordinary sense of whether the color of an illuminated object is close to its color when viewed in natural light .... Thus, the trial decision incorrectly identified the problem of the Exhibit Ko 1 invention that would provide a basis for motivation to adopt the technical matter disclosed in Exhibit Ko 2 in that invention, ... and such motivation cannot be found.

Tokyo District Court, 2018 (Wa) 36690 [Portable Information Communication Device] <Kokubu>

Original Ameblo publication: 2022-03-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12733575323.html

Tokyo District Court, 2018 (Wa) 36690 [Portable Information Communication Device] <Kokubu>

NPE wins—royalty rate of 0.01%

Although not an SEP (standard-essential patent), the court considered “the defendant's” actual circumstances of licensing on a patent-family basis.

(The plaintiff had no licensing track record.)

Following Apple/Samsung, IP High Court, 2013 (Ne) 10043, the special characteristics of smartphones were taken into account.

(Excerpts from the judgment)

... Although the “Research Report on the Utilization of Patents, etc. Based on Intellectual Property Valuation—Survey of Intellectual Property (Asset) Values and Royalty Rates—Main Report, March 2010” prepared by Teikoku Databank, Ltd. (... “the Report”) ... and the aforementioned “Royalty Rates [5th Edition]” contain average royalty rates, etc. for electrical and other fields, the Report states that, in actual license negotiations in the electronics industry, the enormous number of patents related to a single device gives royalty-rate arrangements distinctive characteristics; the royalty rates exemplified there are far below the above averages. These circumstances are considered also to apply to the defendant's products, which are mobile phones (smartphones). It is therefore inappropriate to adopt the above average figures, etc. as prevailing industry royalty rates for the defendant's products. ...

The aforementioned statement by the defendant's employee explains that, under license agreements relating to the defendant's products other than those for standard-essential patents, the royalty rate per patent on a patent-family basis was ...%; of these, the agreement with Company C, which used a running-royalty arrangement, had an average royalty rate of approximately ...%; and, around 2010, in connection with sales of the defendant's products, the defendant paid total license fees of ... US dollars per unit, including patent license fees for standards relating to image processing and external output (... sales revenue per unit of the defendant's products was approximately ●(omitted)● yen). ...

Taking into overall account the circumstances that (ii) the invention at issue is not shown to be irreplaceable for the defendant's products; (iii) the extent of the defendant's benefit from practicing it is also unclear; ... and (iv) the plaintiff and defendant are not competitors, and although the plaintiff does not practice patented inventions itself and has a business policy of earning royalties by licensing them to other companies, it has never concluded a license agreement for any patented invention it holds, it is appropriate to find that the royalty rate receivable for manufacture and sale of the defendant's products in respect of the invention at issue is 0.01%.

Restrictions on “Multiple-Multiple Dependent Claims”—Revised Examination Guidelines, explanatory materials, videos, and public-comment results have been released.

Original Ameblo publication: 2022-03-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12733615939.html

Restrictions on “Multiple-Multiple Dependent Claims”

The Japan Patent Office has released revised Examination Guidelines, explanatory materials, videos, and public-comment results.

Even “or” can create a multiple-multiple dependent claim.

⇒ Measures such as including claim-like language are needed to avoid added matter in Europe, where multiple-multiple dependent claims are not prohibited.

Restrictions on Multiple-Multiple Dependent Claims | Japan Patent Office, Ministry of Economy, Trade and Industry (jpo.go.jp)

IP High Court, 2019 (Ne) 10057 [Mixed Solution for Extracting Protein] <Otaka> = 2017 (Wa) 41474 <Tanaka>

Original Ameblo publication: 2022-03-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12733742753.html

IP High Court, 2019 (Ne) 10057 [Mixed Solution for Extracting Protein] <Otaka>

* “Extraction” was construed to mean separation into two layers.

⇒ Claim not satisfied

(Excerpts from the judgment)

Paragraph [0026] of the description at issue states: “If the ratio of protein to aqueous solvent in the protein-containing layer is higher than the ratio of protein to aqueous solvent in the liquid to be extracted, it can be said that protein has been extracted from the liquid to be extracted.” However, this merely states that extraction of protein from the liquid can be considered to have occurred where the ratio of protein to aqueous solvent in the protein-containing layer is higher than that in the liquid to be extracted. It cannot be understood as stating that “extraction” in “extracting protein” in Element B is limited to such cases. ...

The claims of the invention at issue contain no provision defining the meaning or method of “extraction” in “extracting protein.” ...

... Taken as a whole, the description at issue indicates that “extraction” in “extracting protein” in Element B means separating the liquid to be extracted, which contains protein, an aqueous solvent, etc., into at least two layers, so that a protein-containing layer is formed. ...

It cannot be found that the “extraction material” to which the defendant's product was added was separated into two layers by that product, with a protein-containing layer formed below. Nor can the defendant's product be found to have a configuration capable of ... “extracting protein.”

= [First instance] Tokyo District Court, 2017 (Wa) 41474 [Mixed Solution for Extracting Protein] <Tanaka>

(Excerpts from the judgment)

In a mixed solution “for extracting protein,” the amount of surfactant contained is construed ... as being limited to a level that does not require a step of removing the surfactant from the separated or otherwise treated target substance.

⇒ Claim not satisfied

IP High Court, 2020 (Ne) 10045 [Dot Pattern] <Kanno> Support requirement: not satisfied; amendment requirements: not satisfied (added matter)

Original Ameblo publication: 2022-03-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12734296412.html

IP High Court, 2020 (Ne) 10045 [Dot Pattern] <Kanno> **Support requirement: not satisfied; amendment requirements: not satisfied (added matter)**

* Mere consistency of the disclosure in the description with the claimed invention (i.e., that the two can be construed without contradiction) is insufficient as a disclosure ...

⇒ The description must be worded so that it should be understood as adopting that configuration!!

⇒ Support requirement: not satisfied (Claim 3)

* An amendment claiming a combination of two incompatible embodiments was found to constitute added matter. (Claim 1)

= IP High Court, 2013 (Gyo-Ke) 10346 [Method of Manufacturing a Crystal Oscillator] <Ishii>

= IP High Court, 2016 (Gyo-Ke) 10257 [Portable Information Communication Device] <Mori>

(Excerpts from the judgment)

<Portion concerning failure to meet the support requirement>

... Admittedly, it is clear that the orientation of a dot pattern can be recognized by providing dots or dot groups indicating its direction and arranging them without rotational symmetry; also, the “x, y coordinate flags” or “general code flags” shown in Figures 5 through 8 can be said to be arranged in positions without rotational symmetry, so it is possible for them to serve also as dots indicating the dot pattern's orientation. However, Description 3 at Issue is not worded so that it should be understood as adopting such a configuration, and cannot be said to disclose in the first place which selection of “ways of shifting from the original position” was used to configure Invention 3 at Issue ....

<Portion concerning added matter>

According to the appellant's argument, portion (i) of Amendment 1 at Issue is based on the dot pattern in Figure 105, while portion (ii) corresponds to the dot pattern in Figure 5; thus, Amendment 1 at Issue combines these two patterns. ... The two dot patterns employ incompatible methods of defining information, and combining them amounts to nothing less than creating an entirely new method of defining information.

Tokyo District Court, 2018 (Wa) 1233 [Support Structure for Concrete Foundations] <Kokubu> * Damages

Original Ameblo publication: 2022-03-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12734466536.html

Tokyo District Court, 2018 (Wa) 1233 [Support Structure for Concrete Foundations] <Kokubu> * Damages

Taisei Corporation v. Obayashi Corporation (patent infringement established)

Construction sites with negative marginal profit ⇒ Marginal profit calculated as zero

The effects of the invention had a somewhat limited influence on customer appeal.

⇒ Partial rebuttal of the presumption of damages under Article 102(2)

Damages were determined as the sum of the higher of the amounts under paragraphs (2) and (3) for each construction site where the invention was practiced.

(Excerpts from the judgment)

For Defendant's Structure 6, the marginal profit of the structure as a whole was negative, and the amount equivalent to revenue from completed construction under the above calculation would be below the cost of completed construction. However, the court determined that this did not immediately make those figures abnormal, and then set the marginal profit attributable to cast-in-place concrete piles at zero. ...

For the cast-in-place concrete piles involved in the practice at issue, the effects of the invention on customer appeal must be regarded as somewhat limited. This should be considered a circumstance warranting partial rebuttal of the presumption of damages under Article 102(2). ...

For each structure involved in the practice at issue, ... the greater of the damages calculated under Article 102(2) and (3) of the Patent Act is recognized as the plaintiff's damages.

IP High Court, 2020 (Gyo-Ke) 10016 [Barbed Suture Having ... Concave-Convex Barbs] <Kanno>

Original Ameblo publication: 2022-03-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12734640608.html

IP High Court, 2020 (Gyo-Ke) 10016 [Barbed Suture Having ... Concave-Convex Barbs] <Kanno>

<Addition and Substitution>

* The transition point in the cited invention is unclear ⇒ The transition point is a matter of design choice!!

“The configuration in the cited reference is unclear ⇒ A matter of design choice

The configuration in the cited reference is definite ⇒ Motivation to change it is required.”

Since that is the direction of the approach,

“The patentee should argue that the configuration in the cited reference is definite,

while the invalidation-trial requester will want to argue that it is unclear.”

“In the cited invention ... there is a transition region in which the direction of curvature changes. As a shape transitioning from a concave to a convex surface, transition through a region or transition at a point is one of the alternatives that a person skilled in the art may adopt.”

(Excerpts from the judgment)

In the cited invention, it is unclear at first glance whether a transition point is provided, and whether the concave portion extends between the connecting portion and a transition point and the convex portion between that transition point and the tip. At least, however, there is a transition region where the direction of curvature changes in the region transitioning from the concave to the convex portion. Since transition through a region or transition at a point can be understood as one of the alternatives available to a person skilled in the art for a shape transitioning from a concave to a convex surface, it would have been easy for such a person to replace the shape transitioning from the concave to the convex portion through the transition region of the cited invention's outer edge with a shape transitioning at a point, thereby arriving at the configuration of the amended invention relating to Difference 1.

<Article> “Overview of Actions to Revoke JPO Trial Decisions in 2020”

Original Ameblo publication: 2022-04-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735231953.html

<Article> “Overview of Actions to Revoke JPO Trial Decisions in 2020”

A compact compilation of recent important intellectual property judgments

<Example included>

IP High Court, 2019 (Gyo-Ke) 10174 [Aerosol Generation Device]

The claim language was narrowly construed in light of the problem.

⇒ Support requirement: satisfied

The claim is limited to configurations capable of solving the problem and therefore meets the support requirement.

(Excerpts from the judgment)

The support requirement is assessed by comparing the claims with the detailed description of the invention. As a premise for that comparison, however, when identifying the invention from the claims, if it is necessary to clarify the meaning or technical significance of features defining the invention stated in the claims, consideration of the description and drawings as necessary should not be precluded; the Lipase judgment cited by the parties cannot be construed as prohibiting this. In this case, in light of the description at issue, Claims 1 and 15 can be understood as found in (1) above. Comparing the claims and detailed description on that basis, the claimed invention is an invention disclosed in the detailed description and falls within the scope in which a person skilled in the art can recognize, from that disclosure, that the invention's problem can be solved.

(b) The plaintiff argues that allowing a narrow construction of the claims based on the detailed description when assessing support would mean that, however broadly worded the claims, they would never fail the support requirement, defeating its purpose, and would also allow infringement to be asserted on the basis of broad claims, creating an improper double benefit. However, even where the detailed description is considered in assessing support, a violation of the support requirement can still arise if the content of the invention recognized from the claims with reference to the detailed description is not supported by that description (for example, where the invention recognized from the claim language with reference to the detailed description includes both A and B, but only B appears in the examples, etc., A may be found unsupported). Thus, failure to meet the support requirement is not invariably avoided. Further, because the description and drawings are to be taken into account when determining the technical scope of a patented invention (Patent Act, Article 70(2)), the double benefit alleged by the plaintiff cannot be said to arise.

Overview of Actions to Revoke JPO Trial Decisions in 2020 (jpaa.or.jp)

South Korean Supreme Court Judgment of April 8, 2021, 2019 Hu 10609

Original Ameblo publication: 2022-04-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735232618.html

South Korean Supreme Court judgment

Delivered April 8, 2021, 2019 Hu 10609

Even when assessing inventive step for a “selection invention,” difficulty in arriving at its configuration is considered, as for ordinary inventions.

= The approach is now the same as Japanese case law!!

* The court below (High Court), like the Japanese Examination Guidelines, had held a “selection invention” unpatentable without a qualitatively different or remarkable effect.

<Article> “All Issues in Inventive Step” (Hideki Takaishi, January 2022)

Original Ameblo publication: 2022-04-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735233618.html

<Article> “All Issues in Inventive Step” (Hideki Takaishi, January 2022)

Recent hot topics are:

(1–1) ★ Inherent properties

(1–6) Publicly worked inventions

(2–4) ★★★ Incorporating effects into claims

(3–2) Differences between the problems of the invention at issue and the cited invention

(3–7) ★ Numerically limited inventions / parameter inventions

(3–9) ★★★ Disclaimer claims

⇒ Many patents have recently been granted with disclaimer claims: more than 1,000 in 2021 alone. There is room to incorporate them into patent filing strategies.

(Takaishi stepped down under the 6–8 rule, but the Japan Patent Attorneys Association's Patent Committee plans to study this in fiscal 2022.)

[Skit (Sword of Intellectual Property)] Incorporating Effects into Claims

Original Ameblo publication: 2022-04-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735378939.html

[Skit (Sword of Intellectual Property)] Incorporating Effects into Claims

In Japan, an effect incorporated into a claim becomes a feature defining the invention unless it necessarily results from the configuration.

⇒ It contributes to inventive step.

Because the claim is construed so as to produce the effect, the scope of rights (technical scope of the invention) is not narrowed.

Since products that do not produce the effect are outside the scope of rights (gist of the invention), the support requirement is also easier to satisfy.

(Hideki Takaishi, Attorney-at-Law, Patent Attorney, and California Attorney)

[Skit (Sword of Intellectual Property)] Incorporating Effects into Claims (Film Shooting on April 16 and 17, 2022) - YouTube

[Skit (Sword of Intellectual Property)] Broadening Further with a Divisional Application

Original Ameblo publication: 2022-04-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735379146.html

[Skit (Sword of Intellectual Property)] Broadening Further with a Divisional Application

After a decision to grant a patent, you can file a divisional application seeking an even broader patent.

(In the skit I say that the patent has been obtained, but I mean that a decision to grant has been obtained.)

⇒ At that point, portions unrelated to the problem of the invention can be left out when abstracting the specific disclosure of the embodiments, etc.

(Hideki Takaishi, Attorney-at-Law, Patent Attorney, and California Attorney)

[Skit (Sword of Intellectual Property)] Broadening Further with a Divisional Application (Film Shooting on April 16 and 17, 2022) - YouTube

[Skit (Sword of Intellectual Property)] Put Various Things in the Original Description

Original Ameblo publication: 2022-04-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735379875.html

[Skit (Sword of Intellectual Property)] Put Various Things in the Original Description

By including “material” for division, amendment, and correction in the original description, you can develop the claims while looking at competitors' products even after filing the patent application.

⇒ One possible patent filing strategy is therefore to disclose a great deal in the original description.

* However, the fifth requirement of the doctrine of equivalents may not be met where the applicant objectively manifested a deliberate decision to omit a disclosed alternative from the claims (Maxacalcitol, Supreme Court of Japan). Merely declining to file repeated divisional applications does not automatically defeat that requirement.

(Hideki Takaishi, Attorney-at-Law, Patent Attorney, and California Attorney)

[Skit (Sword of Intellectual Property)] Put Various Things in the Original Description (Film Shooting on April 16 and 17, 2022) - YouTube

[Skit (Sword of Intellectual Property)] Craft the Original Description Based on Case Law

Original Ameblo publication: 2022-04-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735380174.html

[Skit (Sword of Intellectual Property)] Craft the Original Description Based on Case Law

To embed “material” for division, amendment, and correction in the original description, understand the types of claims recognized in case law and anticipate future claims.

For example: parameters and numerical limitations, disclaimer claims, incorporation of effects and problems into claims, functional claims, uses, and subcombination claims.

(Hideki Takaishi, Attorney-at-Law, Patent Attorney, and California Attorney)

[Skit (Sword of Intellectual Property)] Craft the Original Description Based on Case Law (Film Shooting on April 16 and 17, 2022) - YouTube

<Article> “Protection of ‘Data (Structures)’ under Patent Law” (Tsutomu Shimohagiwara)

Original Ameblo publication: 2022-04-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735572831.html

<Article> “Protection of ‘Data (Structures)’ under Patent Law” (Tsutomu Shimohagiwara)

Eligibility as an invention—products include “computer programs, ‘etc.’”

Examination Guidelines—“data structures (the logical structure possessed by data, expressed by interrelationships among data elements)” may qualify as “computer programs, ‘etc.’”

⇒ This article examines specific cases and is useful in practice.

<Article> “Construction of Method Patent Claims in China—Focusing on Chinese Supreme Court Judgments”

Original Ameblo publication: 2022-04-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735724499.html

<Article> “Construction of Method Patent Claims in China—Focusing on Chinese Supreme Court Judgments” (Jun Lin, Chinese Patent Attorney and Attorney-at-Law; Chunfeng Hu, Chinese Patent Attorney)

(1) Dedication principle

A sequence disclosed only in the description, not in the claims

⇒ Outside the scope of protection

(Hot-Water Bottle Manufacturing Method case)

(2) Principle of limitation by sequence

Even if not stated in the claims, the claim is bound by a sequence directly and clearly understood from the description.

(Elastic Hinge Manufacturing Method case)

* The approach to interpreting method inventions appears close to Japan's. This explanation based on Chinese Supreme Court judgments is useful in practice.

Construction of Method Patent Claims in China—Focusing on Chinese Supreme Court Judgments (jpaa.or.jp)

European Patent Practice (1)(2)(3)(4) <ALL> (From the lecture transcript of German patent attorney Kan Hasegawa)

Original Ameblo publication: 2022-04-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735726237.html

From the lecture transcript of German patent attorney Kan Hasegawa—European Patent Practice (1)(2)(3)(4) <ALL>

European Patent Practice (1) <Procedure>

On entry into the European phase,

• Not amending the description.

⇒ Fees are calculated based on the number of English-language pages and become higher.

• Not amending the claims with patentability in mind.

⇒ The results of the international search are not referred to very much.

• Prove the assignment of the priority right.

• File divisional applications early.

⇒ Maintenance annuities are calculated from the filing date of the parent application.

European Patent Practice (2) <Claim Drafting>

(1) Prepare numerous dependent claims.

⇒ This can prevent the inefficiency of repeated rejections following amendments and new references.

(2) Multiple-multiple dependent claims

⇒ Europe is strict about added matter.

⇒ Even claim 2 + claim 3 may be found to constitute added matter.

⇒ Even for Japanese applications filed from April onward, including multiple-multiple-claim-like language in the description can reduce concerns about added matter in Europe.

(3) As a rule, only one independent claim per category is permitted. (The exceptions also merit study!!)

⇒ Possible drafting approaches: A + (b1 or b2), A + B

(4) Avoid references to external tangible objects.

⇒ References to external tangible objects tend to be disregarded.

([Takaishi] In Japan, I would think that these become features defining the invention in a subcombination claim. A difference in practice.)

(5) Do not write effects into the claims.

⇒ An effect incorporated into a claim is unlikely to become a feature defining the invention and instead raises concerns about an irremediable failure to meet the enablement requirement.

([Takaishi] In Japan, effects incorporated into claims often become features defining the invention, so practice differs.)

(6) Keep the features in an independent claim to a minimum.

⇒ They are difficult to delete later.

⇒ Features unrelated to the problem of the invention can sometimes be removed, but the approach is stricter than in Japan.

(7) Do not state numerical ranges as separate upper and lower limits (for future amendments).

“5–20 wt%, preferably 10–15 wt%”

permits amendment to either

“10–20 wt%” or

“5–15 wt%.”

but

“The lower limit is 5 wt%, preferably 10 wt%. The upper limit is 20 wt%, preferably 15 wt%”

does not permit those amendments.

European Patent Practice (3) <Amendments>

Conditions under which “intermediate generalization” (= an amendment abstracting an embodiment and adding it to a claim) is permitted

- The feature is not related to the other features of the embodiment.

- The overall disclosure justifies the generalized isolation of the feature and its introduction into the claim.

([Takaishi] In Japan, too, for “intermediate generalization” (= an amendment abstracting an embodiment and adding it to a claim), the tendency is that portions unrelated to the problem of the invention may be left out, but portions related to that problem may not.)

In Europe, amendments based solely on drawings are treated strictly.

([Takaishi] In Japan, too, for amendments based solely on drawings, both the question of whether the feature can be discerned at all and the limits of abstraction (generalization to a broader concept) are fairly strict. (This parallels identification of a cited invention from drawings.))

European Patent Practice (4) <Pitfalls in Novelty>

(1) Few exceptions to loss of novelty ⇒ There is no equivalent of Article 30(2) of the Japanese Patent Act!!

(2) Intended use ⇒ In principle, it does not limit the claim!

([Takaishi] Practice differs greatly from Japan.)

(3) ★ Selection inventions ⇒ Novelty is not recognized unless the selection is from two or more lists!!!!

([Takaishi] Practice differs greatly from Japan. In South Korea, too, a recent Supreme Court judgment took the same approach as Japan.)

(Note) The EPO Guidelines for Examination (2023 edition, G-VI, 8; G-VI, 7 from the 2024 edition onward) state that a selection from a single list of specifically disclosed elements does not confer novelty, and that, where a selection from two or more lists of a certain length has to be made, the resulting combination not specifically disclosed in the prior art confers novelty. Novelty of a sub-range selected from a numerical range is assessed under separate criteria.

(4) Self-collision ⇒ There is no equivalent of Article 29-2 of the Japanese Patent Act!

(Note) Article 54(3) EPC includes in the state of the art, for the assessment of novelty, the content of European patent applications filed earlier and published later. However, there is no provision corresponding to the proviso to Article 29-2 of the Japanese Patent Act (the exception where the applicant is the same). An applicant’s own earlier application may therefore destroy the novelty of its own later application (self-collision).

<Article> “Consideration of Publicly Known Designs in Assessing Design Similarity” (Professor Motoki Kato)

Original Ameblo publication: 2022-04-06

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12735909107.html

<Article> “Consideration of Publicly Known Designs in Assessing Design Similarity” (Professor Motoki Kato)

(Design infringement cases) The temporal reference point for publicly known designs considered when identifying the essential parts of a design

—Case law is divided on whether they are limited to those known by the filing date.

* Osaka High Court, 2020 (Ne) 211 held that designs becoming publicly known after the application for the registered design also affect identification of the essential parts.

Consideration of Publicly Known Designs in Assessing Design Similarity (jpaa.or.jp)

English translation of the figure

(Designs publicly known after the filing of the registered design also affect identification of the essential features!!) Osaka District Court, 2017 (Wa) 5109, “Training Equipment”; appeal: Osaka High Court, 2020 (Ne) 211 — appeal dismissed.

Left: registered design at issue (1536247). Right: accused design. Product marking: DOCTORAIR EMS SIX PAD.

Identification of essential features: “basic overall configuration” plus “the shape of each pad piece, the state of connection of each pad piece, and the shape and depth of the cuts between the pads.” Same as the first instance ⇒ dissimilar (no infringement).

(Excerpt from the judgment) “The appellant criticizes the original judgment for referring, when identifying the essential features, to publicly known designs subsequent to the design at issue. However, when identifying the essential features of a registered design, we consider that observing designs publicly known after the filing (including those that follow the registered design) makes it possible to determine whether the relevant configuration included in the registered design attracts the attention of consumers.” “A likelihood of confusion in a broad sense is not what the Design Act regulates.”

Slide 5.

<Article> “The Support Requirement for Parameter Inventions” (Hideki Takaishi, May 2021)

Original Ameblo publication: 2022-04-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12736081534.html

<Article> “The Support Requirement for Parameter Inventions” (Hideki Takaishi, May 2021)

The IP High Court Grand Panel judgment in Polarizing Film imposed an additional requirement for a “parameter invention” to satisfy support: that “the technical meaning of the relationship between the range indicated by the formula and the effect (performance) obtained” be recognizable.

⇒ However, since that Grand Panel judgment, the only decision assessing support by applying this additional requirement is the [Tomato-Containing Beverage case] (IP High Court, 2016 (Gyo-Ke) 10147)!!

⇒ Are there almost no “parameter inventions” in the sense used by the Grand Panel judgment!?

The Support Requirement for Parameter Inventions—Prompted by 2019 (Gyo-Ke) 10173 [Double-Sided Adhesive Tape Case]—(jpaa.or.jp)

<Article> [Brunnian Link Making Device] Case (Kazuo Shibata)

Original Ameblo publication: 2022-04-08

<Article> Comparators and the Position of “Unpredictable Remarkable Effects” in Inventive-Step Assessment (2021, Hideki Takaishi)

Original Ameblo publication: 2022-04-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12737522502.html

<Article> “Supreme Court Judgment of August 27, 2019, 2018 (Gyo-Hi) 69, ‘... Eye Drops’ Case (Comparators and the Position of ‘Unpredictable Remarkable Effects’ in Inventive-Step Assessment)” (January 2021, Hideki Takaishi)

Although the prior judgment holding the configuration (medical use) obvious had become final and was binding, inventive step could still be recognized based on “unpredictable remarkable effects.” Compatible with the independent-requirement theory.

“Ultimately, the court below must be understood as having revoked the trial decision by immediately denying that the effects of the inventions at issue were unpredictable and remarkable, solely because it was known at the priority date that the other compounds at issue had effects equivalent to the compound at issue, on the premise that applying that compound to the uses of the inventions at issue could readily have been conceived, without adequately examining whether those effects, particularly their degree, were unpredictable and remarkable from the perspectives of whether a person skilled in the art could not have predicted them at the priority date as effects produced by the configurations of the inventions, and whether they were remarkable effects exceeding the range that such a person could have predicted from those configurations. Such a determination by the court below must be said to involve an unlawful error in the interpretation and application of law.”

⇒ After remand: IP High Court, 2019 (Gyo-Ke) 10118 <Mori>

“... Even where there is motivation to arrive at an invention's configuration, if, at the priority date, its effects are remarkable and exceed the range of effects that a person skilled in the art could have predicted as resulting from that configuration, the invention cannot be found to have been readily made by such a person. The prior judgment did not decide whether such unpredictable remarkable effects existed, and its binding effect (Administrative Case Litigation Act, Article 33(1)) does not extend to that issue ....”

⇒ Inventive step recognized based on “unpredictable remarkable effects”

Supreme Court Judgment of August 27, 2019, 2018 (Gyo-Hi) 69, “Eye Drops for Treating Allergic Eye Disease” Case—Comparators and the Position of “Unpredictable Remarkable Effects” in Inventive-Step Assessment (jpaa.or.jp)

<Article> “Intermediate Generalization—A Special EPC Patent Procedure” (November 2019, Christian Koster)

<Article> “Intermediate Generalization—A Special EPC Patent Procedure” (November 2019, Christian Koster, German and European Patent Attorney)

At the EPO, intermediate generalization is in principle not allowed, but there are instances in which it is permitted.

⇒ By citing decisions allowing and disallowing it, this article proposes assessment criteria and approaches to argument—useful for European patent practice!!

Intermediate Generalization—A Special EPC Patent Procedure—(jpaa.or.jp)

<Article> “Judicial Assessment of Whether Computer Programs Qualify as Trade Secrets” (July 2019, Takayuki Ishimoto)

Original Ameblo publication: 2022-04-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12738053378.html

<Article> “Judicial Assessment of Whether Computer Programs Qualify as Trade Secrets” (July 2019, Takayuki Ishimoto)

Where source code contains no distinctive processing, the subject protected as a trade secret is construed as the actual source code itself, and the scope of unauthorized use is narrow.

There are no decisions recognizing an algorithm as a trade secret.

Judicial Assessment of Whether Computer Programs Qualify as Trade Secrets (jpaa.or.jp)

<Article> “Analysis of Case Law Trends on the Extended Effect of Earlier Applications” (January 2019, Japan Patent Attorneys Association Patent Committee)

Original Ameblo publication: 2022-04-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12738054292.html

<Article> “Analysis of Case Law Trends on the Extended Effect of Earlier Applications” (January 2019, Japan Patent Attorneys Association Patent Committee)

<Relationship between the extended effect of earlier applications and added matter>

In light of the purpose of the system, the scope of an earlier application's effect in excluding later applications ... should coincide with the standard for determining added matter, which governs whether amendment, correction, or division is permissible.

Exception—IP High Court, 2014 (Ne) 10080

As an exception, in the IP High Court case 2014 (Ne) 10080, “Method of Manufacturing Spinel-Type Lithium Manganate,” the court held: “... The description at issue does not expressly disclose spinel-type lithium manganate excluding forms that ‘substantially contain sodium or potassium in the crystal structure,’ nor can this be said to be a matter self-evident from the description; therefore, the technical matter ‘(excluding those substantially containing sodium or potassium in the crystal structure)’ cannot be said to be disclosed in the description.” It thus found the correction introducing a “disclaimer claim” to constitute added matter. However, since that case differs from a typical disclaimer-claim case excluding a single point in the structural formula of a chemical substance, careful examination is required before generalizing it. In any event, whether this approach is appropriate will be an issue for future examination.

<Article> “Claim Satisfaction and the Clarity Requirement for Numerically Limited Inventions” (May 2018, Hideki Takaishi)

1. Numerical values (parameters) have multiple meanings.

2. Significant digits where a value falls slightly outside the numerical range

3. Elements outside the numerical range coexist in a single product.

4. Manufacturing tolerances

5. Changes over time after manufacture

6. Claims expressing degree—sufficiently, approximately, substantially

Claim Satisfaction and the Clarity Requirement for Numerically Limited Inventions (jpaa.or.jp)

IP High Court, 2020 (Gyo-Ke) 10057 [Electric Bed] <Kanno>

Original Ameblo publication: 2022-04-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12739302480.html

IP High Court, 2020 (Gyo-Ke) 10057 [Electric Bed] <Kanno>

The technical fields of the primary and secondary references are far apart.

⇒ Motivation to combine denied (Claim 2)

Does being in a different technical field mean that a person skilled in the art would not know it?

If so, why is this an issue of motivation to combine?

If the technical field differs from that of the claimed invention, is suitability as the primary reference denied?

(Excerpts from the judgment)

The Exhibit Ko 1 invention concerns a medical bed 10 and addresses setting it at a preselected vertical height according to the patient's anticipated needs; it selects a “convenient height for getting into and out of bed 10” as the lower intermediate position (that height also prevents entrapment even if the caregiver's or patient's feet are present ...). In contrast, the Exhibit Ko 3 invention concerns ... a vehicle convertible-roof opening and closing device. In view of the risk of trapping an object when closing the roof, its problem is to provide such a device that automatically pauses just before the roof closes completely, allowing safety to be reliably checked; it additionally seeks to avoid causing discomfort to the operator.

The two technical fields are far apart and have in common only the abstracted problem of avoiding the risk of trapping objects. Extracting a common problem from different inventions in such different technical fields and attempting to apply specific solutions suited to their respective characteristics across those fields requires particular creativity .... There is no motivation to apply the Exhibit Ko 3 invention to the Exhibit Ko 1 invention ....

IP High Court, 2020 (Gyo-Ke) 10053 [Composition for Percutaneous and Transmucosal Absorption of Carbon Dioxide] <Kanno>

Original Ameblo publication: 2022-04-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12739302910.html

IP High Court, 2020 (Gyo-Ke) 10053 [Composition for Percutaneous and Transmucosal Absorption of Carbon Dioxide] <Kanno>

The primary reference cannot be recognized as having the problem of the invention at issue.

⇒ Inventive step affirmed.

⇒ It is necessary to consider, above all, what problem can be recognized from the primary reference.

⇒ Difference 1 (“thickener content of 1–15 mass%”) is not obvious.

(Excerpts from the judgment)

The deliberate instruction in the Exhibit Ko 1 invention to “wait until [Babu] has completely dissolved” is understood to have the technical significance of waiting until a sufficient amount of carbon dioxide is generated from Babu and dissolved in the water. A person skilled in the art encountering Exhibit Ko 1 would therefore understand from that disclosure that its invention completely dissolves the Babu pieces and seeks to promote blood circulation through percutaneous absorption of carbon dioxide dissolved in the hot water. Such a person cannot be found to recognize a problem of “continuously retaining carbon dioxide in bubble form” in that invention. ... Exhibit Ko 1 expressly instructs one to “wait until [the Babu pieces] have completely dissolved.” Even if a person skilled in the art visually observed carbon dioxide bubbles being generated from Babu, it is difficult to find that the person would focus on carbon dioxide in bubble form, which is merely a process or means of producing dissolved carbon dioxide and cannot itself be said to contribute to percutaneous absorption. Nor is there sufficient evidence to establish, in the first place, that preventing carbon dioxide from escaping into the air without dissolving in the hot water is a problem of the Exhibit Ko 1 invention. The plaintiff argues that the problem of “continuously retaining carbon dioxide in bubble form” is self-evident or readily discoverable and that it is therefore unnecessary to determine whether it can be recognized from the Exhibit Ko 1 invention. However, ... in considering whether the invention at issue could readily have been conceived from that invention, it is necessary above all to consider what problem a person skilled in the art encountering the Exhibit Ko 1 invention could recognize from it. The plaintiff's argument must therefore be rejected.

IP High Court, 2012 (Gyo-Ke) 10252 [Thermostable Ribonuclease H] <Shibata>

Original Ameblo publication: 2022-04-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12739303434.html

IP High Court, 2012 (Gyo-Ke) 10252 [Thermostable Ribonuclease H] <Shibata>

* Remarkable effects cannot be established from a publication distributed after filing.

* Identifying pre-filing inventions or common general technical knowledge based on knowledge disclosed in the patent description is impermissible, because it may result in assessing inventive step for the patent application with hindsight.

(Excerpts from the judgment)

In general, inventive step is assessed as of the filing date (or the claimed priority date where priority is claimed), not at the time of examination (Patent Act, Article 29(2)). The knowledge that may be considered in assessing inventive step is therefore knowledge available before filing; this applies equally to assessing whether the configuration is obvious and whether the effects are remarkable. Moreover, identifying pre-filing inventions or common general technical knowledge based on knowledge disclosed in the description of the patent application may result in assessing that invention's inventive step with hindsight, contrary to the purpose of that paragraph, and is impermissible.

Osaka High Court, 2002 (Ne) 2776 [Object Embedded in Concrete]

= Tokyo High Court, 2003 (Gyo-Ke) 65

The child application violates the divisional requirements because of an amendment's retroactive effect.

⇒ The grandchild application's filing date does not relate back to the parent application.

* A final finding of invalidity of the child application is irrelevant to whether the grandchild application's filing date relates back to the parent application.

Everything depends on whether the child application satisfies the divisional requirements!!

Tokyo High Court, 2001 (Gyo-Ke) 421 <Yamashita> [Drainage Channel Structure]

* All claims deleted by correction ⇒ No interest in maintaining the action

“All claims were deleted ... deemed never to have existed from the outset ....”

★ For a grandchild divisional application, when the child application receives a final notice of reasons for rejection for added matter, is an amendment deleting all claims OK!?

2015 (Wa) 8517 [Paddy Ridge Plastering Machine] <Shimasue> The judgment concerned a third-generation patent in a chain of original application ⇒ first generation ⇒ second generation ⇒ third generation. Although the second-generation application had been withdrawn, it was never disputed that the third generation's filing date could relate back to the first generation and original application.

Tokyo High Court, 1989 (Gyo-Ke) 135 <Takeda> [Aqueous Suspension Polymerization Method for Vinyl Chloride]

* Withdrawal of an application has no retroactive effect except under Article 39(5) of the Patent Act.

⇒ Withdrawal cannot cure a child's failure to meet the divisional requirements due to added matter.

⇒ At worst, amend to delete all claims; but if one prepares a claim that does not add matter at the time of division ...

99F18E381FDF9C6049256D39000E304 (courts.go.jp)

Tokyo District Court, 2019 (Wa) 25152 [Comment Distribution System] <Kokubu> (Dwango v. FC2)

Original Ameblo publication: 2022-05-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12742511150.html

2019 (Wa) 25152 [Comment Distribution System] <Kokubu> (Dwango v. FC2)

* To constitute “production” of a product invention, a product satisfying all the elements of the patented invention must be newly created within Japan.

⇒ No “production” within Japan

⇒ The elements are satisfied, but no infringement!!

(Excerpts from the judgment)

... “Production” as “working” a product invention (Patent Act, Article 2(3)(i)) is understood as the act of newly creating a “product” falling within the technical scope of the invention. Further, under the principle of territoriality, meaning that a patent right is effective only within the territory of the country concerned (see Supreme Court, Third Petty Bench judgment of July 1, 1997, 1995 (O) 1988, Minshu Vol. 51, No. 6, p. 2299; and Supreme Court, First Petty Bench judgment of September 26, 2002, 2000 (Ju) 580, Minshu Vol. 56, No. 7, p. 1551), it is appropriate to construe such “production” as limited to production within Japan. Accordingly, to constitute “production,” a product satisfying all the elements of the patented invention must be newly created within Japan. ... The “server” ... must be regarded as playing an important role as a component achieving the objective. From this standpoint too, ... the mere fact that the user terminals are located in Japan does not establish that most components of Defendant's System 1, the subject of “production,” are located within Japan ....

The defendant's service supported Japanese and appears to have been provided to users residing in Japan; ... it is also established that Defendant HPS, a Japanese corporation, was commissioned by Defendant FC2 to perform work relating to services operated by FC2, including the defendant's service. Nevertheless, ... no circumstances supporting an assessment that the result would be grossly inappropriate have been established, such as Defendant FC2, a US corporation, placing the video-distribution and comment-distribution servers outside Japan to evade liability for infringement of the patent at issue while substantially managing them from within Japan. ...

... Although the defendant's system is found to fall within the technical scope of the invention at issue, ... production of that system by the defendants within Japan after May 17, 2019, when the patent was registered, is not established, nor can the defendants be found to have worked the invention within Japan. Accordingly, infringement of the patent right by the defendants cannot be established.

IP High Court, 2021 (Ne) 10007 [Infusion Preparation Containing Sulfur-Containing Compounds and Trace Metal Elements] <Honda> Reversal Finding Literal Claim Satisfaction

Original Ameblo publication: 2022-05-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12743084420.html

IP High Court, 2021 (Ne) 10007 [Infusion Preparation Containing Sulfur-Containing Compounds and Trace Metal Elements] <Honda> (First instance: Tokyo District Court, 2018 (Wa) 29802 <Tanaka>)

Construction of the claim language “multiple chambers”—the product invention limited by “capable of communication” was held not satisfied, while the method invention without that limitation was held satisfied.

⇒ Reversing the first-instance judgment that neither was satisfied!!

[Summary of This Judgment and Some Observations]

1. Claims (Claim 1 and Claim 10)

(Claim 1)

1A In an infusion container having multiple chambers partitioned by partition means capable of opening communication through external pressure,

1B one chamber is filled with a solution containing at least one substance selected from the group consisting of sulfur-containing amino acids and sulfites,

1C another chamber houses a trace-metal-element container containing a liquid that includes at least one trace metal element selected from the group consisting of iron, manganese, and copper,

1D the trace-metal-element container being a bag made of thermoplastic resin film,

1E An infusion preparation characterized by the foregoing.

(Claim 10)

10A In a multichamber infusion preparation,

10B a chamber containing a solution that includes at least one substance selected from the group consisting of sulfur-containing amino acids and sulfites, and

10C a separate chamber housing a trace-metal-element container containing a liquid that includes at least one trace metal element selected from the group consisting of iron, manganese, and copper,

10D the trace-metal-element container being a bag made of thermoplastic resin film,

10E A method of stabilizing an infusion preparation during storage, characterized by the foregoing.

2. Claim Construction in the First Instance, Tokyo District Court, 2018 (Wa) 29802 (Excerpts from the Judgment)

The court will determine ... whether the defendant's product and method have the configuration in Elements 1C and 10C of “a trace-metal-element container ... housed in a chamber.” ...

Because infusion solutions ordinarily do not contain trace metal elements such as copper, patients receiving long-term infusions develop so-called trace metal deficiency. However, storing the trace metal elements needed to prevent this in a mixture with the infusion solution causes quality deterioration through chemical

reactions. To prevent this, when one chamber is filled with an amino-acid infusion solution containing sulfur-containing amino acids and the trace-metal-element container is placed in that same chamber, a technical problem arises: the solution containing trace metal elements becomes unstable even though the amino-acid infusion solution and the trace metal elements are isolated from one another.

The inventions at issue should be regarded as solving this technical problem by adopting a configuration in which one of multiple chambers partitioned by partition means capable of opening communication is filled with a solution containing sulfur-containing amino acids, and a container containing trace metal elements is housed in a different chamber, thereby achieving the effect of providing an infusion preparation having a solution containing sulfur-containing compounds, characterized by the stable presence of the trace metal elements.

Accordingly, the distinctive technical configuration of the inventions at issue in terms of solving the problem lies in housing the trace-metal-element container not in the same chamber as the solution containing sulfur-containing amino acids, but in another chamber capable of communicating with it. On the premise of an infusion container having multiple chambers partitioned by partition means capable of opening communication, each of the multiple “chambers” is structured to be filled with and store a different infusion solution; the adopted technical configuration is therefore one in which the “chamber” housing the trace-metal-element container is structured to be filled with and store an infusion solution different from the solution containing sulfur-containing amino acids.

In other words, in the inventions at issue, “multiple chambers” in Element 1A and “multichamber” in Element 10A are construed as respective spaces structured to be filled with and store various infusion solutions. For a space provided in an infusion container to constitute the “chamber” in Elements 1C and 10C, one of those chambers, it must have a structure capable of being filled with and storing an infusion solution ....

Considering the defendant's product and method, ... the space between the outer and inner resin films of small chamber T does not communicate with the middle chamber and small chamber V during use. In light of this, that space cannot be found to have a structure capable of being filled with and storing an infusion solution, and cannot be regarded as a “chamber.”

3. Claim Construction in the IP High Court, 2021 (Ne) 10007 (Excerpts from the Judgment)

... Regarding the problem of the corrected inventions at issue ...

The corrected inventions at issue concern the following circumstances. Infusion containers having multiple chambers partitioned by partition means capable of opening communication are used in hospitals. Infusion solutions ordinarily lack trace metal elements, causing trace metal deficiency with long-term administration. However, storing trace metal elements mixed with infusion solutions causes quality deterioration, so they continue to be mixed immediately before infusion. In light of this, research began to create an infusion preparation using a container with multiple chambers partitioned by partition means capable of opening communication through external pressure, allowing trace metal elements to be mixed in at the time of use without the possibility of bacterial contamination, and offering excellent storage stability. It was then discovered that filling one chamber with an amino-acid infusion solution containing sulfur-containing amino acids and placing the trace-metal-element container in that same chamber creates the problem that the trace-metal-element solution is unstable even when the amino-acid infusion solution and trace metal elements are isolated. On that basis, the inventions aim to provide an infusion preparation having a solution containing sulfur-containing compounds, characterized by the stable presence of trace metal elements. ...

Corrected Inventions 1 and 2 at Issue address providing an infusion preparation having a solution containing sulfur-containing compounds, characterized by the stable presence of trace metal elements. More specifically, they are understood to address providing an infusion preparation using a container

having multiple chambers partitioned by partition means capable of opening communication through external pressure, with trace metal elements stored in advance in a form allowing their admixture at use, in which those elements remain stable even when one chamber is filled with a solution containing sulfur-containing compounds. Similarly, Corrected Inventions 10 and 11 at Issue address providing a method of stabilizing such an infusion preparation during storage. ...

... Regarding “chambers” ...

... In the infusion container of the appellee's product, the space formed by the fundamental series of members in its configuration can be described as the space formed by the series of members directly constituting the large and middle chambers and also constituting the exterior of small chambers T and V. ... Paragraph [0024] of the description at issue expressly states that the “chamber housing the trace-metal-element container” may or may not be filled with a solution, and paragraph [0033] expressly states that “in the infusion preparation of this embodiment, first chamber 4 of the infusion container shown in Figure 1 may or may not be filled with a solution.” Accordingly, in the corrected inventions at issue, whether a space is filled with an infusion solution is not an indispensable factor in determining whether it is a “chamber” ....

In Element 1A ..., the specification “partitioned by partition means capable of opening communication through external pressure” precedes “an infusion container having multiple chambers.” ... The appellee's product does not satisfy the requirement that the “chambers” be “capable of communication,” and therefore does not satisfy Element 1A ....

Unlike Element 1A ..., Element 10A ... does not require the “chambers” to be “capable of communication.” Accordingly, ... the appellee's method satisfies Element 10A ....

4. Some Observations

The first-instance judgment stated that it would determine “whether the defendant's product and method have the configuration in Elements 1C and 10C of ‘a trace-metal-element container ... housed in a chamber.’ ...” It then construed the “chambers” of the invention at issue, “on the premise of an infusion container having multiple chambers partitioned by partition means capable of opening communication,” as structures for filling with and storing different infusion solutions, solving the “technical problem that, when one chamber is filled with an amino-acid infusion solution containing sulfur-containing amino acids and the trace-metal-element container is placed in that same chamber, the trace-metal-element solution becomes unstable even though the amino-acid infusion solution and trace metal elements are isolated from one another.” It found non-satisfaction, holding: “Considering the defendant's product and method, ... the space between the outer and inner resin films of small chamber T does not communicate with the middle chamber and small chamber V during use. In light of this, that space cannot be found to have a structure capable of being filled with and storing an infusion solution, and cannot be regarded as a ‘chamber.’”

By contrast, unlike the first-instance judgment, the appellate judgment did not premise its analysis on the multiple chambers being capable of communication. It identified the invention's problem as “providing an infusion preparation having a solution containing sulfur-containing compounds, characterized by the stable presence of trace metal elements.” It then held that Element 1A (product invention) includes, before “an infusion container having multiple chambers,” the specification “partitioned by partition means capable of opening communication through external pressure,” and thus is not satisfied by the defendant's product, which is not “capable of communication.” Element 10A (method invention), however, does not require the “chambers” to be “capable of communication,” so it is satisfied even by the defendant's method that is not “capable of communication.”

Thus, the difference in conclusions between the first-instance and appellate judgments arose because, although Element 10A (method invention) did not require the “chambers” to be “capable of communication,” the first-instance court construed it as being “on the premise of an infusion container

having multiple chambers partitioned by partition means capable of opening communication," adopting a narrow construction that added a "capable of communication" limitation absent from the claim language. The appellate judgment, in contrast, pointed out that Claim 1 (product invention) has the defining feature "capable of communication," while Claim 10 (method invention) does not, and declined that narrow construction. Where multiple claims include one with the defining feature "capable of communication" and one without it (although not in a dependent relationship), the latter claim was held not to carry that limitation, resulting in non-satisfaction of the former and satisfaction of the latter. This is not a typical "claim differentiation" case, but it can be understood as a case making manifest the entirely possible difference in outcomes between claims with and without a defining feature, whether dependent or independent. (Of course, the result might have been the same had Claim 1 not existed and only Claim 10 been disputed. Still, varying defining features among multiple claims in this way—for example, establishing a relationship in which a limited dependent claim corresponds to a more specific "problem"—may reduce uncertainty arising from narrow construction.)

The appellate judgment first identified the problem as "providing an infusion preparation having a solution containing sulfur-containing compounds, characterized by the stable presence of trace metal elements," and then identified it "more specifically" as "providing an infusion preparation using a container having multiple chambers partitioned by partition means capable of opening communication through external pressure, with trace metal elements stored in advance in a form allowing their admixture at use, in which those elements remain stable even when one chamber is filled with a solution containing sulfur-containing compounds." I considered whether the result had changed (been reversed) because the first-instance and appellate judgments interpreted the invention's problem differently, as in the IP High Court judgment in 2017 (Ne) 10092, "Device for Cooling Power Electronics," cited below. However, insofar as I have examined the appellate judgment's logic, identifying the problem more specifically does not appear directly related to the conclusion that the method invention of Claim 10 should not be narrowly construed as including "capable of communication," which is absent from the claim language.

[Introduction to Related Decisions (Comprehensive Coverage of the Last 16 Years' Decisions Reversed on Appeal)]

≪(1) Claim Not Satisfied ⇒ Satisfied (Reversal in Favor of the Patentee)≫

(1) ★ IP High Court, 2009 (Ne) 10006, "Hollow Golf Club Head" case <Iimura>

"(1) Possibility of substitution ... The purpose and effects (or principle of solving the problem) are shared.

(2) Ease of substitution

(3) Whether the difference is a non-essential part

The purpose and effects of the invention at issue ... lie in increasing the bonding strength between the metal shell member and the fiber-reinforced-plastic shell member." ⇒ Infringement under the doctrine of equivalents: yes

First instance: Tokyo District Court, 2007 (Wa) 28614 <Abe>

"The invention at issue ... increases the bonding strength between the two shell members by using ... a stitching material in addition to adhesive bonding, because simply bonding the joint portion of the metal shell member to the joint portion of the fiber-reinforced-plastic shell member does not provide sufficient strength. ... Joining the metal shell member and the fiber-reinforced-plastic shell member with stitching material is the distinctive configuration for solving the problem, and that stitching material must be regarded as an essential part of the invention." ⇒ Infringement under the doctrine of equivalents: no (first requirement not satisfied)

(2) ★★★ IP High Court, 2017 (Ne) 10092, “Device for Cooling Power Electronics” case <Takabe>

“The cooling-fluid passage is a configuration for cooling the heat-dissipating bridge .... From the standpoint of cooling efficiency, the wall formed by the bottom surface of the heat-dissipating bridge must extend over the entire length of the cooling-fluid passage. In contrast, ... the rear bearing is not cooled by air passing through the cooling-fluid passage, ... and [the wall] need not necessarily extend over the entire cooling passage.”

⇒ The accused product's “rear-bearing bridge-side passage” does not extend along the entire longitudinal length, but literal claim satisfaction was found on reversal.

* Limiting the problem of the invention to cooling the “heat-dissipating bridge” broadened the invention!!

First instance: Tokyo District Court, 2016 (Wa) 13239 <Shibata>

“The claims prescribe that Invention 1 at Issue has multiple portions serving as paths for fluid, ... and can be said to prescribe that the ‘cooling-fluid passage (17)’ is the space in which the above longitudinal walls face one another.” ⇒ Claim not satisfied

(3) IP High Court, 2010 (Ne) 10031, “Kitchen Sink” case <Iimura>

“Element C1 ... addresses the prior-art problem that ... dedicated cooking plates had to be separately prepared ... for the upper and middle stepped portions. To solve that problem, the rear wall is formed so that the front-to-back distances of the upper and middle stepped portions are substantially equal, allowing the same plate to be selectively laid across either stepped portion.” ⇒ Claim satisfied

⇒ The accused product's “inclined surface” includes a vertical surface beyond the portion extending rearward, but literal claim satisfaction was found on reversal.

* Identifying the problem as eliminating the need to prepare dedicated cooking plates broadened the invention!!

First instance: Tokyo District Court, 2009 (Wa) 5610 <Shimizu>

* Being able to “enlarge the interior space” (paragraph [0018]) is a problem of the invention at issue.

“From the statement ‘...’ ([0018]), ... the ‘inclined surface extending rearward as it extends downward’ in Element C1 means an inclined surface having a certain area and angle of inclination, which, between the upper and middle stepped portions, extends rearward as it extends downward to form an ‘interior space’ with a certain rearward expanse.” ⇒ Claim not satisfied

(4) Tokyo High Court, 2003 (Ne) 1223, “Method for Searching for a Stable Complex Structure of Ligand Molecules” case <Yamashita>

* The problem of the invention at issue was identified differently from the court below. ⇒ Even numerous “dummy atoms” are OK.

“The core technical concept of the patented invention ... lies in searching for ligand molecules that bind stably in the hydrogen-bonding region of a biopolymer, focusing on hydrogen bonds, etc., and comparing the distances between dummy atoms placed at positions of heteroatoms capable of serving as hydrogen-bonding partners for hydrogen-bonding functional groups in the biopolymer with the distances between hydrogen-bonding heteroatoms in the ligand molecule, while simultaneously estimating the ligand molecule's active conformation. Although dummy atoms themselves are indispensable, their number is not directly related to this technical concept of the patented invention ....” ⇒ Reversal finding literal claim satisfaction

First instance: Tokyo District Court, 2001 (Wa) 21278 <Mimura>

“A ‘dummy atom’ in the patented invention is set as one atom for each hydrogen-bonding region of each atom capable of hydrogen bonding in the biopolymer.” ⇒ Claim not satisfied

(Reasons) (i) The description uses it to indicate a single point. (ii) The plaintiff's own paper also sets only one dummy atom. (iii) Numerous dummy atoms would fail to achieve the invention's purpose of speeding up calculation. (iv) If numerous dummy atoms are included, the disclosure requirements are violated.

(5) ★ IP High Court, 2018 (Ne) 10016, “Nozzle for Spraying a Liquid as Fine Particles” case <Otaka>

“Claim 4 ... contains no wording limiting the particle diameter of ‘fine particles’ to a particular numerical range. ... Reading the description ... as a whole, ... it does not state that being able to spray fine particles with a diameter of ‘10 μm or less’ has any particular effect. ... ‘Fine particles’ means particles with a small diameter; the numerical range of that diameter is not limited ....” ⇒ Reversal finding literal claim satisfaction

* The numerical value stated in the description was not what solved the invention's problem. ⇒ No numerical limitation!!

First instance: Osaka District Court, 2015 (Wa) 12965 <Takamatsu>

“The description at issue first points out the prior-art drawback that nozzles capable of spraying fine particles with a diameter of 10 μm or less clog extremely easily, then explains that the invention aims to solve that clogging problem, and further explains in the section on means for solving the problem ... that it ‘succeeds’ in spraying fine-particle droplets with a diameter of 10 μm or less. ... ‘Spraying a liquid as fine particles’ in the invention means that the thin-film flow of liquid pressed by high-speed air becomes fine droplets of 10 μm or less when it leaves the smooth or inclined surface.”—Limited to the numerical value in the description ⇒ Claim not satisfied

(6) IP High Court, 2011 (Ne) 10002, “(Cut) Rice Cake” case <Iimura> ⇒ Reversal finding literal claim satisfaction

≪Issue≫ Whether the claim “providing ... a groove on the peripheral side surface, which is the upright side face of the upper surface portion of this small rice-cake body, rather than the bottom resting surface or flat top surface of the cut rice cake” includes the accused product, which has “grooves” not only on the body's “peripheral side surface” but also on its “flat top surface.”

(i) There is no punctuation as in “rather than the bottom resting surface or flat top surface, on the peripheral side surface, which is the upright side face of the upper surface portion of this small rice-cake body.” (ii) “There is no passage in the detailed description ... explaining, for example, that forming cuts, etc. on the bottom resting surface or flat top surface prevents the above effects.” (iii) An amendment to “only on the peripheral side surface” was met with a notice of reasons for rejection on the ground of added matter, and the applicant withdrew it.

First instance: Tokyo District Court, 2009 (Wa) 7718 <Otaka> ⇒ Claim not satisfied

(i) “If the intention were not to exclude such an embodiment, the appropriate claim expression would have been ‘the ... peripheral side surface that is not the bottom resting surface or flat top surface.’” (ii) “The effect of being ‘capable of practical use without impairing the aesthetic appearance of the rice cake after grilling’ ... excludes embodiments with grooves on the bottom resting surface or flat top surface.” (iii) The applicant's written opinion, submitted with the withdrawal of the amendment and stating that the claim was not limited, did not affect the conclusion.

(7) IP High Court, 2014 (Ne) 10082, “Method for Manufacturing 4H-Type Single-Crystal Silicon Carbide” case <Takabe>

Neither the claims nor the description at issue contains language limiting the starting material charged into the crucible.

References “expressly stating that the material charged into the crucible is not limited to solid silicon carbide” (Exhibits Ko 14 and Ko 40-5)

Based on the descriptions in “books on semiconductor silicon carbide technology” (Exhibits Ko 3 and 25), the court found no fundamental difference between seeded sublimation recrystallization and the Lely method as to the starting material charged into the crucible.

“It cannot be said that interpretation should be limited only to the embodiments .... ‘Sublimation recrystallization’ ... also includes an embodiment using silicon and carbon as starting materials ... to form crystalline silicon carbide, and sublimating that silicon carbide to form single-crystal silicon carbide on the seed crystal.” ⇒ Reversal finding literal claim satisfaction

First instance: Tokyo District Court, 2011 (Wa) 23651 <Takano> ⇒ Claim not satisfied

“To solve a problem that could not be solved even by the improved Lely method introduced to obtain high-quality single-crystal silicon carbide, which uses silicon carbide powder as the raw material and performs sublimation recrystallization using a seed crystal, the invention adopted ... a method of heating and sublimating silicon carbide raw material, supplying it onto a seed crystal of single-crystal silicon carbide, and growing single-crystal silicon carbide on that seed crystal .... ‘Sublimation recrystallization’ ... means sublimating a polycrystalline solid raw material consisting of the same substance as the product (note: solid silicon carbide) and then crystallizing it to obtain a single-crystal product.”

(8) IP High Court, 2010 (Ne) 10089, “Method and Apparatus for Encrusting and Forming Food” case <Takizawa>

“Although the effects described assume that a pushing member enters the outer skin material to a certain depth, forms it into a ‘bowl shape,’ and then places the filling inside the bowl-shaped portion while the pushing member rises, they do not exclude other placement methods, and the claims impose no particular limitation on the manner of placement. ... If the pushing member enters the outer skin material to a certain depth, forms it into a ‘bowl shape’ (Element 1D), and supplies filling from the pushing member so that filling is placed in the outer skin material, ... the element is satisfied.” ⇒ Reversal finding claim satisfaction (another element satisfied by equivalence)

First instance: Tokyo District Court, 2009 (Wa) 1201 <Abe>

“The ‘pushing member’ in Invention 1 at Issue ... is contemplated to enter deeply into the outer skin material, to an extent requiring prevention of ‘the outer skin material stretching farther downward than necessary’ and ‘contraction of the outer skin material as the pushing member rises,’ and to form the outer skin material into a bowl shape while stretching its peripheral region. It means a member that forms the outer skin material into a ‘bowl’ shape with a depth approximately equal to the height of the formed product and discharges filling into the bowl-shaped portion formed by that member.”—The accused product's “nozzle member” does not constitute the “pushing member” ⇒ Claim not satisfied

(9) IP High Court, 2005 (Ne) 10119, “Range Hood Filter Device” case <Tsukahara>

Although there were grounds for invalidity, negligence in communicating or disseminating false facts under the Unfair Competition Prevention Act was denied because the claim was satisfied.

≪Caution≫ Negligence in communicating or disseminating false facts is not invariably denied simply because the patent is “invalid but the claim is satisfied”!!

“Given that Element (7) provides ‘formed into similar rectangular shapes in plan view,’ and that ‘similar shapes’ modifies ‘rectangular shapes in plan view,’ mere rectangularity cannot be construed as satisfying ‘similar shapes.’ However, construing ‘similar shapes’ with mathematical rigor would make even practicing the invention difficult. Ultimately, if the ratios of the lengths of the vertical and horizontal sides are approximately equal, the shapes can be considered similar.” ⇒ Reversal finding literal claim satisfaction (negligence in communicating or disseminating false facts denied)

First instance: Osaka District Court, 2005 (Wa) 1394 and 2005 (Wa) 3681 <Yamada>

“In ordinary usage, a square and a rectangle, or rectangles with markedly different length-to-width ratios, are not called ‘similar’ shapes .... Even considering the statement ... ‘The filter may have a similar shape corresponding to the planar shape of the metal filter or filter element. For example, the filter may be rectangular in plan view, corresponding to a rectangular metal filter or filter element’ ([0018]), ‘similar shapes’ cannot be understood as used in a sense different from ordinary usage.” ⇒ Claim not satisfied

(10) IP High Court, 2007 (Ne) 10025, “Seal Base Material” case <Tsukahara>

“Although the ‘core material’ ... is defined, insofar as the claim wording is concerned, as ‘consisting of transparent synthetic resin injected into the tubular body,’ its shape is not specifically prescribed. ... ‘Core material’ must exist inside the inner circumferential surface of the tubular body and inside the sheet body, but nothing further is prescribed. ... According to the description, ‘core material’ means a transparent synthetic resin injected in liquid form inside the sheet body within the tubular body and subsequently hardened by a solidification treatment ...; however, no wording ... indicating the limitation imposed by the original judgment ... that it must be located in the middle or center can be found. ... ‘Core’ also means ‘the essential part,’ and the synthetic resin here ... performs that function. Thus, even taking dictionary meanings into account, the original judgment's determination is inappropriate.” ⇒ Reversal finding literal claim satisfaction

First instance: Osaka District Court, 2005 (Wa) 3668 <Yamada>

“Linguistically, ‘core’ is also written with the character meaning ‘heart,’ and is generally understood from dictionaries to mean ‘the middle of an object: (1) the central (hard) portion of an object; (2) the essential part, foundation, or inherent nature; (3) fabric inserted in a collar, obi, etc. to maintain and arrange its shape; (4) in flower arrangement, the name of the principal central branch.’ Because the invention ... concerns a seal base material, ... ‘core’ is construed in sense (1), not (2), (3), or (4).” ⇒ Claim not satisfied

(11) IP High Court, 2008 (Ne) 10065, “Device for Automatically Creating Telephone Number Information” case <Iimura>

Other claim language and the technical level at filing (ISDN) led to reversal of the first-instance construction limited to the embodiments!!

“Given that the ‘connection signal’ in Element B ... should be understood as a broader concept encompassing both audible and inaudible signals, there is no basis for limiting the ‘response message’ in Element C to audible messages either. ... Since ISDN technology already existed at filing, and obtaining information returned from an ISDN network and determining telephone-number validity from it were known, a person skilled in the art encountering the description would not recognize the technical concept of the invention as being disclosed with ISDN technology excluded ....”—Not limited to voice messages!! ⇒ Reversal finding literal claim satisfaction

First instance: Tokyo District Court, 2007 (Wa) 32525 <Otaka> ⇒ Claim not satisfied

“In the description, ‘message’ is used to mean a voice announcement (voice communication) returned from an exchange. ... The expression ‘response message’ is not used, nor is there any disclosure or suggestion that the three types of telephone numbers can be identified and sorted using connection signals other than ‘voice messages.’”—Limited to voice messages

(12) ★ IP High Court, 2017 (Ne) 10027, “Financial Instruments Transaction Management Method” case <Mori>

* The identification of the accused method differs from that of the court below!! ⇒ Reversal finding literal claim satisfaction

“On Screen 2, the customer recognizes the ‘price interval’ between multiple orders and the ‘profit margin’ from the difference between the newly designated rate and the profit-taking rate, and after making changes as necessary can choose not to order by clicking ‘Back’ or ‘Cancel.’ Nevertheless, the customer can click

‘Order’ ... to place the order. The customer therefore inputs ‘information indicating the price interval’ and ‘information indicating the profit margin’ as buy/sell order application information ....”

First instance: Tokyo District Court, 2015 (Wa) 4461 <Shoji>

“Defendant's Service 1 ... has no field for inputting, as buy/sell order application information, the ‘profit margin’ when buying (selling) at a prescribed price and then selling (buying) at another price; it therefore does not receive and accept the ‘profit margin’ as buy/sell order application information.” ⇒ Claim not satisfied

(13) IP High Court, 2012 (Ne) 10023, “Apparatus for Processing Material with a Laser” case <Iimura>

* Claim construction is the same as in the court below. The accused product was found to use a “green laser”!!

“Considering that (i) the defendant's product uses a green laser, and even with a green laser, insufficient flow speed causing water to remain in the focus-cone tip region for a long time can lead over time to a thermal lens and damage to the nozzle wall, and (ii) measures to prevent nozzle-wall damage are required in the defendant's product, among other matters, the flow speed in the focus-cone tip region within its liquid reservoir can be said to be sufficiently high to suppress thermal-lens formation to the point where part of the laser beam does not damage the nozzle wall. The defendant's product therefore ... satisfies the element.” ⇒ Reversal finding literal claim satisfaction

First instance: Tokyo District Court, 2008 (Wa) 12409 <Otaka>

“‘Without a stagnation space’ means ... that the liquid flow speed is sufficiently high ... to suppress formation of a thermal lens that causes nozzle-wall damage .... ‘The liquid flow speed is sufficiently high’ means that the speed is high enough that ‘in the focus-cone tip region (56), thermal-lens formation is suppressed to the point where part of the laser beam does not damage the nozzle wall.’”—Causal relationship denied between the absence of damage and the configuration “without a stagnation space” ⇒ Claim not satisfied

≪(2) Claim Satisfied ⇒ Not Satisfied (Reversal against the Patentee)≫

(1) IP High Court, 2016 (Ne) 10031, “Oxaliplatin Solution Composition” case <Tsuruoka>

“The invention ... aims to provide an oxaliplatin solution composition containing fewer impurities ... than the Exhibit Otsu 1 invention, etc., and adopts as its solution a configuration containing a prescribed quantity of ‘oxalic acid ...’ as a ‘buffering agent’ .... The ‘buffering agent’ of the invention acts so that ... fewer impurities are produced than in the Exhibit Otsu 1 invention .... Dissociated oxalic acid naturally generated ... by decomposition of oxaliplatin naturally exists in the Exhibit Otsu 1 invention as well ....”

“In the embodiments too, the ‘buffering agent’ ... is added from outside .... Compared with ... Example 18(b), which is similar to the Exhibit Otsu 1 invention, ... only a significantly smaller quantity of impurities is produced ....”

⇒ The “buffering agent” does not include dissociated oxalic acid naturally generated by decomposition of oxaliplatin.

First instance: Tokyo District Court, 2015 (Wa) 12416 <Hasegawa>

No limitation in the claim. / Dissociated oxalic acid also functions as a buffering agent. / The embodiments are one factor to consider.

⇒ The “buffering agent” includes dissociated oxalic acid naturally generated by decomposition of oxaliplatin.

* Argument that including dissociated oxalic acid would negate novelty—the accuracy of the replication experiment was rejected.

(2) ★ IP High Court, 2009 (Ne) 10033, “Heat-Dissipating Sheet Made of a Thermally Conductive Silicone Rubber Composition” case <Nakano>

[Claim 1] “Thermally conductive inorganic filler ... 40 vol%–80 vol% of the total composition”

“The embodiments also show coupling treatment of the entire amount of thermally conductive inorganic filler before filling it into silicone rubber, and confirm the effect by comparison with entirely untreated filler. ... A person skilled in the art would understand ... that the entire amount undergoes coupling treatment ....”

⇒ If the entirely treated thermally conductive inorganic filler is “80 vol% or less,” the cured molded article can be prevented from becoming hard and brittle. Under the plaintiff's argument (that the amount excludes the coupling agent), even 1% surface-treated thermally conductive inorganic filler and 39–79% untreated filler would satisfy the claim, including configurations not producing the effects. ⇒ The numerical amount includes the coupling agent. ⇒ Claim not satisfied

First instance: Osaka District Court, 2006 (Wa) 11429 <Tanaka>

“Given the statement explaining the numerical limitation that ‘it is difficult to obtain high thermal conductivity below 40 vol%,’ what must be at least 40 vol% is the amount of the thermally conductive inorganic filler itself affecting thermal conductivity, not the amount including the coupling agent ....” ⇒ Accused product (GR-n) literally satisfies the claim

(3) IP High Court, 2006 (Ne) 10075, “Method of Inhibiting Decomposition of a Fluoroether Composition ...” case <Tanaka>

[Element D] A step of coating the inner wall surface of the container with a Lewis acid inhibitor that supplies electrons to the vacant orbital of a Lewis acid having a vacant orbital

[Accused method d] A step of coating the inner wall surface of the container ... with an epoxy phenolic resin lacquer

⇒ From the description, the purpose of the “Lewis acid inhibitor” was identified as inhibition through “neutralization.” Non-satisfaction was found even assuming that Lewis-acid inhibition could be achieved through a different causal mechanism.

IP High Court, 2008 (Gyo-Ke) 10276: “Enablement requirement not satisfied”—Since the concept of “Lewis acid” is unclear, the concept of a “Lewis acid inhibitor” donating electrons to that “Lewis acid's” vacant orbital is also unclear ....

First instance: Tokyo District Court, 2005 (Wa) 10524 <Shitara>

“Epoxy phenolic resin interacts with the vacant orbital of a Lewis acid, thereby blocking its potential reactive sites and inhibiting the Lewis-acid-induced decomposition of fluoroether compounds, such as sevoflurane, contacting that acid. It therefore constitutes ... the ‘Lewis acid inhibitor’ of the patented invention.” ⇒ Claim satisfied (no failure of enablement)

(4) ★ IP High Court, 2005 (Ne) 10047, “Chair-Type Air Massage Machine” case <Tsukahara>

The appellate court found no literal satisfaction ⇒ Doctrine of equivalents applied to a narrowed claim (the only such case in a Tokyo high court)

(Note) In this case, literal infringement was rejected, but infringement under the doctrine of equivalents was found for Accused Products 3 and 4. This does not mean that all of the patentee’s claims were dismissed.

⇒ Numerous cases at the Osaka District Court and Osaka High Court. Tokyo District Court, 2017 (Wa) 18184, “Osteotomy Spreader” <Sato>

“The description contains no suggestion of placing a bag on only one side of a leg and holding both legs together, or of a specific configuration for doing so; the embodiments and drawings disclose or depict only

configurations in which leg bags are arranged on both sides of each of the left and right legs. ... Considering also that, to achieve the objective ... of securely holding the legs with air bags, ... a configuration holding each leg from both sides with bags is more suitable, while holding both legs together with air-inflated bags is decidedly unstable, ‘the user's legs’ means ‘each of the left and right legs.’” ⇒ No literal satisfaction

First instance: Tokyo District Court, 2001 (Wa) 3485 <Iimura>

* The claim language is not limited to “a configuration in which leg bags are arranged on both sides of each of the left and right legs.” Nor is it limited by the embodiments, etc. ⇒ Literal satisfaction

(5) ★★★ IP High Court, 2020 (Ne) 10044, “Fluid Supply Device ...” case <Tsuruoka>

Problem of the invention—“Because the prepaid card cannot be seen, there is a risk that, after refueling, the user will forget that the prepaid card is inserted and leave the gas station with the card still there,” plus two other problems

((i) Whether a “judicial admission” was established) “... Whether an admission has been established should be examined in light of the party's answer as a whole .... Although the first-instance answer stated that satisfaction of Element 1C was ‘admitted,’ ... it should substantively be understood as arguing that the processing performed in the defendant's refueling device differs from the processing performed in Element 1C of Invention 1 at Issue ....”

((ii) No literal satisfaction) “... Unless the storage medium contemplates settlement combining ‘retention of the medium’ with ‘later deduction,’ the three problems at issue do not arise; consequently, the configuration of the invention cannot be said to achieve the effect of solving them. A storage medium that cannot contemplate settlement using that combination therefore does not constitute the ‘storage medium’ of the invention.” ⇒ Claim not satisfied

First instance: Tokyo District Court, 2017 (Wa) 29228 <Shibata>

* Judicial admission established for Element 1C

* Doctrine of equivalents satisfied for other elements

* Indirect infringement established for the program invention

(6) ★★★ IP High Court, 2017 (Ne) 10033, “Renovation Sliding Door Device” case <Tsuruoka>

Problem of the invention—“does not reduce the effective opening area”—“substantially the same height” = does not include a step

“‘Substantially the same height’ ... is understood as an expression intended also to include cases where dimensional or design tolerances, etc. prevent the two from being exactly ‘the same height.’ ... It does not include ... cases reaching a level that would be considered a ‘step’ .... The invention concerns ... ‘renovation,’ ... and interpreting ‘substantially the same height’ as including something deliberately installed during renovation ... that would be considered a ‘step’ would differ from a person skilled in the art's ordinary understanding. According to the evidence (Exhibits Otsu ...), ... step shapes with design dimensions of 3 mm or less are treated as ‘no step’ under barrier-free housing standards.” ⇒ Claim not satisfied

First instance: Tokyo District Court, 2014 (Wa) 7643 <Shoji>

Problem of the invention—“the degree ... of reduction of the effective opening area is substantially smaller than in the prior art”

“... Making the height ‘substantially the same’ is a configuration for achieving the effect of securing a large opening area .... In view of the above problem and effect, ... a difference substantially smaller ... than the height difference in the prior art ... can be regarded as ‘substantially the same height.’”

[Patents ★] Appeal in a Patent Infringement Injunction Action (Construction of “Multiple Chambers”—Product Invention Limited by “Capable of Communication” Not Satisfied, Method Invention without That Limitation Satisfied. Reversal of the First-Instance Finding That Neither Was Satisfied. Patentee Wins. - NAKAMURA & PARTNERS (nakapat.gr.jp)

Tokyo District Court, 2020 (Wa) 19924 <Sato> et al. [... Analgesic]—Use Invention Not Satisfied Because the Use Was Excluded; Correction Requirements Also Not Satisfied

Original Ameblo publication: 2022-05-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12743383652.html

Tokyo District Court, 2020 (Wa) 19924 <Sato>, 19932 <Sato>, 19918 <Tanaka>, 19919 <Kokubu> [Analgesic Containing Isobutyl GABA or Its Derivatives]

The use of the defendant's drug is a use excluded during prosecution.

⇒ The “use” limitation is not satisfied!!

“Even if there are cases in which it is difficult to determine what type of pain the patient is complaining of, ... that does not affect ... claim satisfaction.”

* Enablement requirement not satisfied

* Support requirement also not satisfied

* Correction requirements also not satisfied (without disclosure enabling practice so as to produce the effect, correction requirements for a use invention are not met) = IP High Court, 2020 (Gyo-Ke) 10135

(Excerpts from the judgment <(1) Claim satisfaction>)

Element 3B is “in the treatment of pain caused by inflammation or pain caused by surgery,” ... and Element 4B is “in the treatment of hyperalgesic pain due to inflammatory pain, or hyperalgesic or allodynic pain due to postoperative pain.” ... In the written submission ... filed with the JPO at the time of the correction, the plaintiff explained, among other things, that “in Corrected Inventions 3 and 4, the pain to be treated with the analgesic was limited to ‘pain caused by inflammation (inflammatory pain)’ and ‘pain caused by surgery (postoperative pain),’ which the advance notice of the trial decision found to satisfy the enablement and support requirements.” ... Thus, “pain caused by inflammation” and “pain caused by surgery” in Element 3B and “inflammatory pain” and “postoperative pain” in Element 4B all mean inflammatory or postoperative pain classified as nociceptive pain, and do not include neuropathic pain or fibromyalgia .... The defendant's drug has “neuropathic pain and pain associated with fibromyalgia as its indications and effects,” and does not target “pain caused by inflammation,” “pain caused by surgery,” “inflammatory pain,” or “postoperative pain”; it therefore does not satisfy Elements 3B and 4B. ...

The plaintiff argues that the defendant's drug, indicated for neuropathic pain, is used for pain caused by inflammation or surgery, on grounds including that tissue damage from inflammation or surgery causes neuronal sensitization, a functional abnormality of the nerves, leading to hyperalgesia and allodynia. However, even if neuronal sensitization can occur in nociceptive pain, this does not mean that the defendant's drug, indicated for “neuropathic pain and pain associated with fibromyalgia,” is used for pain caused by inflammation or surgery, etc. ...

The plaintiff argues that pain is a patient's subjective psychological state and that, in mixed pain, nociceptive and neuropathic pain constitute one pain in the same patient and cannot be distinguished. However, even if in actual clinical practice it is sometimes difficult to determine the type of pain a patient complains of, that does not alter the above conclusion concerning satisfaction of the claim elements.

(Excerpts from the judgment <(2) Enablement and support requirements>)

For a pharmaceutical use invention, merely identifying the substance, chemical structure, etc. generally makes it difficult to predict the usefulness of the use, and the drug cannot be used for that use. To satisfy

enablement, the detailed description must therefore disclose pharmacological test results enabling a person skilled in the art to understand the drug's usefulness. As held above, however, the description, etc. at issue contains no pharmacological test results enabling such a person to understand that the compound at issue is effective for treating hyperalgesic or allodynic pain due to neuropathic or psychogenic pain. ...

Even if hyperalgesia appearing in nociceptive pain, neuropathic pain, etc. can be said to be related to central sensitization caused by activation of spinal NMDA receptors, it is difficult to find that, at the patent filing date, it was common general technical knowledge that all hyperalgesia appearing in the nociceptive pain (inflammatory pain, postoperative pain, osteoarthritic pain associated with metastatic cancer, gout, burn pain, etc.) or neuropathic pain (trigeminal neuralgia, acute herpetic neuralgia, diabetic neuropathy, causalgia, etc.) described in the description, etc. resulted from functional nerve abnormalities consisting of sensitization of peripheral or central neurons. Still less can it be said that those passages, without pharmacological test results, enabled a person skilled in the art to recognize the compound's effectiveness in treating neuropathic pain.

(Excerpts from the judgment <(3) Correction requirements (for a use invention)>)

The correction relating to Invention 1 at Issue limits the targeted pain to “hyperalgesic or allodynic pain.” However, the description, etc. contains only test results relating to nociceptive pain. It does not disclose that the compound is effective for “hyperalgesic or allodynic pain due to neuropathy,” which is neuropathic pain, or “hyperalgesic or allodynic pain due to fibromyalgia,” included in psychogenic pain, nor is this self-evident from the description, etc. The same is true even considering common general technical knowledge at the patent filing date .... The correction relating to Invention 2 at Issue limits the pain treated by the analgesic to “hyperalgesic or allodynic pain due to neuropathy or fibromyalgia.” However, for the same reasons as above ..., this correction adds new matter not disclosed in the description, etc., and therefore fails the correction requirements ....

On the premise of the plaintiff's argument that Inventions 3 and 4 at Issue include “pain due to neuropathy” or “fibromyalgia,” the corrections relating to those inventions add new matter absent from the description and violate the correction requirements ....

IP High Court, 2020 (Ne) 10059 <Presiding Judge Honda> (Appeal) [Method of Manufacturing an Equol-Containing Extract ...]

Original Ameblo publication: 2022-05-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12743735915.html

IP High Court, 2020 (Ne) 10059 <Presiding Judge Honda> (Appeal) [Method of Manufacturing an Equol-Containing Extract ...]

The “filing date of the patent application for the patent at issue” could relate back to the priority date (also in relation to the defendant's method). (The conclusion differs from the original judgment on this point.)

Products publicly known only between the priority date and the parent application’s filing date were not considered; the product was held not to have been publicly known as of the priority date.

⇒ Article 104 of the Patent Act was applied!!

⇒ Reversal in favor of the patentee

(Passage concerning the “filing date of the patent application for the patent at issue”)

“A person skilled in the art encountering the above disclosure in Basic Applications A and B, together with the common general technical knowledge at the priority date, should be regarded as having been able to recognize that, even when ‘a raw material containing daidzeins’ other than ‘soybean hypocotyls’ is used as the fermentation material, allowing the ‘daidzeins’ in that material to be metabolized together with arginine by a microorganism capable of producing equol and ornithine, such as Lactococcus strain 20-92, can produce a powdered fermentation product for use as a food ingredient, containing at least 8 mg of ornithine and at least 1 mg of equol per gram of dry weight. The corrected invention at issue can therefore be read from Basic Applications A and B. Accordingly, it is at least an invention disclosed, or equivalent to one disclosed, in Basic Applications A and B, and should enjoy the effect of the priority claims based on those applications.

Accordingly, for application of Article 104 of the Patent Act, the patent at issue is deemed to have been applied for on the priority date .... In considering whether the product of the corrected invention was ‘not publicly known’ in Japan before the patent application under that Article, Exhibit Otsu B3 ..., published after the priority date, cannot be considered. ... The product of the corrected invention can be said to have been ‘not publicly known’ at the priority date. ... Since it has not been proven that the method of the corrected invention was not used to produce the appellees' raw material, the presumption under Article 104 cannot be found rebutted.”

(Passage concerning “not publicly known”)

“For a product to qualify as ‘publicly known’ under Article 104 of the Patent Act, there must, at the reference date, be facts known at least to an extent that gives a person skilled in the art a clue to manufacturing it. The product of the corrected invention cannot be said to have been disclosed in Exhibits Otsu B16 and B24, which were publicly known at the priority date, nor could the corrected invention readily have been conceived from either reference .... Thus, a person skilled in the art encountering Exhibit Otsu B16 or B24 at the priority date cannot be said to have obtained a clue to manufacturing the product of the corrected invention.

The appellees also argue that the product of the corrected invention is ‘publicly known’ because it is merely ‘992 mg’ of the fermentation product of ‘Example 1’ in Exhibit Otsu B16, in which ‘1–3 mg of equol is produced per gram of dry weight,’ with ‘8 mg’ of ornithine of ‘97.48%’ purity added as a

nutritional fortification additive (the international publication of Exhibit Otsu B67, WO2006/051940). However, ... the product of the corrected invention is ‘a powdered fermentation product containing ornithine and equol, in which at least 8 mg of ornithine and at least 1 mg of equol are produced per gram of dry weight of the fermentation product, used as a food ingredient.’ Even combining Exhibit Otsu B67 with Exhibit Otsu B16 does not yield a product in which ‘at least 8 mg of ornithine and at least 1 mg of equol were produced per gram of dry weight of the fermentation product.’ The appellees' argument therefore cannot be accepted.”

<Some Observations>

In this decision (the appellate judgment), the presumption concerning a process for producing a new substance under Article 104 of the Patent Act was recognized, and the patentee won.

Of that Article's requirements, “before the patent application,” where a priority claim is recognized, means before the priority date (the filing date of the basic application). In this case, the description of the basic applications disclosed only “soybean hypocotyls” as the fermentation material, not daidzeins other than soybean hypocotyls. On those facts, the first-instance judgment took a partial-priority approach: the “patent application” date was the priority date only for “an invention in which the fermentation material is soybean hypocotyls,” whereas for “an invention in which the fermentation material is daidzeins other than soybean hypocotyls,” the “filing date of the patent application for the patent” did not relate back to the priority date. The appellate judgment, by contrast, held that the problem-solving mechanism disclosed in the basic applications' descriptions applies equally whether the fermentation material is “soybean hypocotyls” or “daidzeins other than soybean hypocotyls.” Thus, even for “daidzeins other than soybean hypocotyls” as in the defendant's product, the “filing date of the patent application for the patent” was the priority date, and products becoming publicly known after that date were not “publicly known products” under Article 104.

In applying “publicly known product” under Article 104, the appellate judgment held: “Since the product of the corrected invention is ‘a powdered fermentation product containing ornithine and equol, in which at least 8 mg of ornithine and at least 1 mg of equol are produced per gram of dry weight of the fermentation product, used as a food ingredient,’ even combining Exhibit Otsu B67 with Exhibit Otsu B16 does not yield a product in which ‘at least 8 mg of ornithine and at least 1 mg of equol were produced per gram of dry weight of the fermentation product.’” Under this logic, narrowing the claim wording by amendment or correction so that “the defendant's product just barely falls within it,” irrespective of inventive step, makes it harder for past publicly known products to fall within “publicly known products” under Article 104. This should be kept in mind when enforcing a patented process for producing a new substance. Conversely, for defendants, the appellate judgment does not reject, in the first place, the very possibility of asserting a product combining products disclosed in two references as a “publicly known product.” Thus, a “publicly known product” under Article 104 may include one obtainable by combination, as in an inventive-step analysis, even if it was not known in a manner depriving it of novelty. In this sense, “publicly known product” under Article 104 is a concept encompassing inventive-step-like arguments for both patentees and accused infringers.

2018 (Wa) 18555 <Tanaka> (First instance)

[Method of Manufacturing an Equol-Containing Extract ...]

* The “filing date of the patent application for the patent at issue” cannot relate back to the priority date (in relation to the defendant's method) ...

⇒ Article 104 of the Patent Act inapplicable because of products becoming publicly known between the priority date and the parent application's filing date

* Partial-priority approach ⇒ The defendant's method is an embodiment not covered by partial priority.

[New YouTube Video] Incorporating Effects into Claims (Inventive Step)

Original Ameblo publication: 2022-05-23

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12744262223.html

[New YouTube Video] Incorporating Effects into Claims (Inventive Step)

* Where an invention's “effect” is incorporated into a claim, the great majority of decisions recognize it as a feature defining the invention unless the configuration necessarily produces that effect.

* In the Examination Guidelines and the inventions in the decisions in which an “effect” stated in a claim was not recognized as a defining feature, the claimed “effect” does not further specify the product (its configuration, use, etc.), and is therefore not recognized as such a feature.

On the other hand, * in the great majority of inventions in decisions recognizing an “effect” stated in a claim as a defining feature, that claimed “effect” further specifies the product (its configuration, use, etc.).

* Further, the above-cited IP High Court decisions in 2017 (Gyo-Ke) 10041, “Hot-Pressed Member,” and 2020 (Gyo-Ke) 10015, “... Novel Formulation,” adopt a framework recognizing inventive step unless the claimed “effect” was one that a person skilled in the art could recognize at the priority date. Further case law is awaited on whether an “effect” can become a defining feature even without further specifying the product (its configuration, use, etc.).

[New YouTube Video] Offers to Assign (Etc.) (Place (Domestic or Overseas) + Timing (Offers Shortly before Expiration))

Original Ameblo publication: 2022-05-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12744437118.html

[New YouTube Video] Offers to Assign (Etc.) (Place (Domestic or Overseas) + Timing (Offers Shortly before Expiration))

(1) Must an act of “offering to assign” take place within Japan?

⇒ Japan—yes (IP High Court, 2010 (Ne) 10001, “Motor,” Presiding Judge Nakano—a case concerning international jurisdiction)

⇒ United States—not necessary? (Is it enough that the “assignment” takes place within the US?) (Transocean decision (2010))

(2) Can an “offer to assign” be established even if the “assignment” takes place abroad?

⇒ Japan—most academic views hold that no “offer to assign” is established.

* “Method of Producing L-Glutamic Acid” case—“all overseas sales were intended to be sales to buyers in Japan.” Special circumstances existed.

⇒ United States—not established unless the intended future place of sale is within the US (TAOS decision (2018))

* Meaning of (“domestic”) “assignment”—both “transfer of possession” and “transfer of ownership”?

⇒ If the product itself is abroad, does concluding the sales contract domestically still fail to establish a “domestic” assignment? (There is a similar US district court decision.)

(3) Where “assignment” is planned for after expiration of the patent term ⇒ Infringement established

(4) Other matters ⇒ A “general standard” for website presentations constituting “offers to assign” (IP High Court, 2015 (Ne) 10109)

(10) [Patents] Offers to Assign (Etc.) (Place (Domestic or Overseas) + Timing (Shortly before Expiration)) - YouTube

IP High Court, 2020 (Gyo-Ke) 10122 [Method of Improving Myocardial Performance in Fontan Patients Using a Udenafil Composition] <Kanno>

Original Ameblo publication: 2022-05-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12744630707.html

IP High Court, 2020 (Gyo-Ke) 10122 [Method of Improving Myocardial Performance in Fontan Patients Using a Udenafil Composition] <Kanno>

* Problem of the invention: “improving” exercise tolerance—a pharmaceutical use invention

(The description distinguishes “maintenance” from “improvement.”)

⇒ The description must enable a person skilled in the art to understand that it can be used for “improvement.”

Enablement requirement not satisfied

* Support requirement also not satisfied

(Excerpts from the judgment)

... A person skilled in the art encountering the application's description can be said to understand that the regimen at issue can bring about improved exercise tolerance. (The description distinguishes cases where peak-exertion VO2 values are “maintained” from those where they are “improved” ([0078]); a person skilled in the art can therefore be said to understand that mere “maintenance” of peak-exertion VO2 values is not included in “improvement.”) ...

The claimed invention ... is a pharmaceutical composition administering a specified amount of udenafil to Fontan patients, based on the hypothesis that administering a PDE5 inhibitor with a longer half-life than sildenafil prevents or improves the decline in aerobic capacity after Fontan surgery, to improve exercise tolerance measured by peak-exertion VO2 in patients who have undergone that surgery, and because the PDE5 inhibitor udenafil may be useful as once-daily treatment for various conditions. It is therefore a pharmaceutical use invention. To satisfy enablement, the application's detailed description must enable a person skilled in the art to understand that administering udenafil or a pharmaceutically acceptable salt thereof at 87.5 mg per dose, twice daily, can be used to improve exercise tolerance measured by peak-exertion VO2 in patients who have undergone Fontan surgery. ...

The plaintiff argues that some patients actually experienced substantial improvement in symptoms .... However, the description presents the test results in Example 3 as a whole. Considering that disclosure as a whole, it cannot be said that a person skilled in the art would understand that the regimen could be used to improve exercise tolerance measured by peak-exertion VO2 in patients who have undergone Fontan surgery ....

IP High Court, 2020 (Gyo-Ke) 10150 [Equol-Containing Fermented Soybean Hypocotyl Product] <Honda>

Original Ameblo publication: 2022-05-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12745319527.html

IP High Court, 2020 (Gyo-Ke) 10150 [Equol-Containing Fermented Soybean Hypocotyl Product] <Honda>

(1) Novelty: yes

The fermentation materials and conditions differ between Table 3 of the description at issue and the test examples in the cited reference.

⇒ The amount of ornithine per gram of dry weight also changes.

IP High Court, 2019 (Ne) 10015 <Otaka>: narrow construction ⇒ Claim not satisfied

(2) Inventive step: yes

The factors considered when finding an invention obvious by applying a secondary cited invention to a primary cited invention also apply when determining whether it could readily have been invented by applying well-known technology to a cited invention.

(3) Divisional application requirements: satisfied

[(Corrected) Claim 1] A method of manufacturing ... at least 8 mg of ornithine and at least 1 mg of ... per gram of dry weight of the fermentation product

—Only the lower limit of “8–15 mg” in the original description was incorporated into the claim.

(Excerpts from the judgment)

<Violation of the delegated ministerial-ordinance requirement>

... The plaintiff points out that paragraph [0010] under [Problem to Be Solved by the Invention] in the description contains no mention of ornithine. However, ... Article 24-2 of the Regulations under the Patent Act concerns the “statement of the detailed description of the invention,” so it is sufficient that the matter can be understood from the description as a whole; the matters necessary to understand the invention's technical significance need not necessarily appear in the “Problem to Be Solved by the Invention” section.

<Divisional application requirements>

... Paragraph [0050] of the original description states: “Specific examples of the ornithine content in the equol-containing fermented soybean hypocotyl product are approximately 5–20 mg, preferably 8–15 mg, and more preferably 9–12 mg of ornithine per gram of dry weight of the equol-containing fermented soybean hypocotyl product.” It thus states a preference for 8–15 mg of ornithine per gram of dry weight. Configuration (iii) above can be said to be specified by the lower limit of the “8–15 mg” exemplified in the original description.

<Novelty>

... The plaintiff's argument assumes that Table 3 of the description shows conversion from arginine to ornithine well over 100% (approximately 159%). However, ... the fermentation materials and conditions differ. The fermentation product's dry weight can vary greatly with the solid content of the fermentation materials and culture medium, so changing the fermentation material also changes the amount of ornithine per gram of dry weight. Thus, the ornithine yield per gram of dry weight can vary greatly between using soybean hypocotyl solution and using soy milk as the fermentation material. The conversion rate from arginine to ornithine can also differ with culture conditions. Accordingly, it is inappropriate to rely on Table

3 of the description in estimating ornithine production in the test examples of Exhibit Ko 1. ... Because the composition of the BHI broth used as the medium in those examples is unspecified, the Exhibit Ko 1 invention does not necessarily produce at least 8 mg of ornithine per gram of dry weight .... It therefore cannot be said to “produce at least 8 mg of ornithine per gram of dry weight of the fermentation product.”

<Inventive step>

... When determining whether the claimed invention could readily have been made by applying a secondary cited invention to a primary cited invention, it is appropriate (i) to assess motivation to apply the secondary invention to the primary invention and arrive at the claimed invention by comprehensively considering suggestions within either invention, relationships between technical fields, commonality of problems, actions or functions, etc.; and (ii) also to consider factors obstructing application, unpredictable remarkable effects, etc. (see IP High Court judgment of April 13, 2018 [2016 (Gyo-Ke) 10182 and 10184]). This also applies when determining whether the claimed invention could readily have been made by applying well-known technology to a cited invention.

Tokyo District Court, 2019 (Wa) 7470, 7476 [... Graphitic Carbon Material] <Sato>

Original Ameblo publication: 2022-06-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12745869166.html

Tokyo District Court, 2019 (Wa) 7470, 7476 [Graphitic Carbon Material Used as a Graphene Precursor] <Sato>

If a publicly worked product falls within the numerical limitation, public working is established even without recognition of that fact (not disputed).

The defendant's products (publicly worked products) were:

not subject to a prohibition on resale;

generally sold graphite powder;

outside the scope of nondisclosure agreements.

X-ray diffraction is not explained even in the description at issue.

(Excerpts from the judgment)

[Claim 1] ... A graphitic carbon material ... having Rate(3R) of 31% or more. Rate(3R) = P3 / (P3 + P4) × 100 ... (Equation 1), where P3 is the peak intensity of the (101) plane of the rhombohedral graphite layer (3R) measured by X-ray diffraction, and P4 is the peak intensity of the (101) plane of the hexagonal graphite layer (2H) measured by X-ray diffraction.

The defendant's products ... are graphite powders used in conductive materials, conductive paints, etc., and there is no indication that their resale was prohibited .... It is difficult to consider purchasers obligated to keep secret the physical properties of graphite powders such as those products. ... There is insufficient evidence that the defendants concluded nondisclosure agreements imposing such an obligation on customers. The plaintiff submits sample basic agreements ... as evidence, but those agreements merely prescribe confidentiality for “the other party's technical information and business secrets” ...; the sample basic agreements ... submitted by the defendant likewise cover only “business-related confidential matters.” The plaintiff also submits ... a confidentiality agreement ... concluded with Defendant Nippon Graphite Industries, but it concerns “consideration” of matters such as “joint technical development” ... and does not establish that product purchasers owe a confidentiality duty. It is difficult to regard the physical properties of generally sold graphite powder, such as the defendant's products ..., as automatically subject to such a duty. ...

The plaintiff argues that, even if the defendants sold their products ... before the applications at issue, neither the defendants nor their customers possessed technology allowing them to analyze the products and determine whether they fell within the claims of the inventions at issue. However, X-ray diffraction appears to be a general method of analyzing substances, as indicated by its mention without particular explanation in the descriptions, etc. It is found that measurement and analysis could have been outsourced to an external provider. ...

090941_hanrei.pdf (courts.go.jp)

Tokyo District Court, 2020 (Wa) 8506 [Work Gloves for Electrical Work] <Sato>

Original Ameblo publication: 2022-06-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12746044679.html

Tokyo District Court, 2020 (Wa) 8506 [Work Gloves for Electrical Work] <Sato>

“The plaintiff ... argues, on the premise that the “irregularities” must have been intentionally formed, that they are merely “surface roughness” inevitably arising in manufacture. However, ... the irregularities on the surface of the Exhibit Otsu 1 gloves ... cannot be said to have arisen inevitably in manufacture, but were intentionally formed.”

⇒ Does public working require intentional formation?

Even exclusive sales amount to “disclosure to a third party” and constitute public working. (* No evidence establishing a nondisclosure agreement)

The surface irregularities of the publicly worked product were intentionally formed.

Other matters not limited by the claim language are not differences.

(Excerpts from the judgment)

[Claim 1] ... Work gloves for electrical work, characterized by irregularities formed along the fibers and mesh portions of the fabric body.

The plaintiff argues that Tohoku Electric Power was a joint developer because the design of the Exhibit Otsu 1 product was based on its workers' requests. However, Tohoku Electric Power merely collected its workers' opinions and requests about revising the size of the previous product and conveyed the results to Defendant Yotsugi. There is no other sufficient evidence that Tohoku Electric Power jointly developed the Exhibit Otsu 1 product with Yotsugi. ...

The plaintiff argues that Tohoku Electric Power was the exclusive purchaser of the Exhibit Otsu 1 product and would not disclose the Exhibit Otsu 1 invention to third parties under commercial custom. However, there is no evidence establishing such a custom. Yotsugi sold the product to Tohoku Electric Power and transferred ownership, and there is insufficient evidence that Tohoku Electric Power had a duty not to disclose the configuration of its purchased products to third parties. In fact, the product was used by Tohoku Electric Power's on-site workers, so the invention's content must be regarded as having been disclosed to third parties ....

The plaintiff argues, on the premise that the “irregularities” in Element H must have been intentionally formed, that they are merely “surface roughness” inevitably arising in manufacture. However, ... the surface of the Exhibit Otsu 1 gloves displays a mesh-like pattern formed by the knit fabric in the intermediate portion, with irregularities along the fibers and mesh portions of the fabric body. They therefore cannot be said to have arisen inevitably in manufacture, but must be regarded as intentionally formed. ...

The plaintiff argues ... . However, ... Element E ... is not limited to ... .

= IP High Court, 2020 (Gyo-Ke) 10038 <Kanno>

* Limiting the treated patients (50 or more and less than 80) is obvious.

The deliberation results report classifies renal impairment using creatinine clearance as the indicator: “80 or more,” “50 or more and less than 80,” “30 or more and less than 50,” and “less than 30.”

(Excerpts from the judgment)

... Since Condition (4) at Issue merely selects from osteoporosis patients the group satisfying all Three Conditions at Issue and confirms safety in that group, the Three Conditions and Condition (4) can be understood as independent conditions serving different purposes. The plaintiff argues that the Four Conditions are organically combined into a single whole, but ... that argument cannot be accepted. ...

... A person skilled in the art encountering Exhibit Ko 7's express exclusion of patients with severe renal impairment would recognize that the treated patients in the Exhibit Ko 7 invention include a substantial number with mild or moderate renal impairment .... Further, ... it is clear that safety confirmation in patients with renal impairment was also required for osteoporosis drugs. Thus, a person skilled in the art encountering the Exhibit Ko 7 invention would naturally focus on the treated patients' renal function; doing so is nothing exceptional. ...

Exhibit Ko 10 defines patients with “mild” renal impairment as those with “GFR 50–79 ml/min,” treating patients with creatinine clearance of 50–79 ml/min as mildly impaired. ... The deliberation results report ... classifies renal impairment by creatinine clearance along those values as “80 or more,” “50 or more and less than 80,” “30 or more and less than 50,” and “less than 30” .... Accordingly, selecting from the treated patients of the Exhibit Ko 7 invention those with ... “50 or more and less than 80 ml/min” would present no difficulty to a person skilled in the art.

IP High Court, 2020 (Gyo-Ke) 10123 [Fuel Cell System] <Honda>

Original Ameblo publication: 2022-06-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12746440268.html

IP High Court, 2020 (Gyo-Ke) 10123 [Fuel Cell System] <Honda>

* It is not obvious to change a cited invention detecting a malfunction into a configuration checking periodically.

⇒ Inventive step: yes (rejection decision revoked)

(Difference)

The “prescribed condition” for adjusting gas flow is:

Claimed invention—“periodically”

Cited invention—“output voltage below approximately 0.4 V”

(Excerpts from the judgment)

It is difficult to say that a person skilled in the art could readily conceive of performing “periodically,” irrespective of whether the actual output has changed to or above the threshold, the cited invention's operation “when the fuel cell output voltage falls below 0.4 V,” which specifically detects a condition indicative of fuel-cell malfunction .... Exhibit Ko 3 ... contains descriptions other than ... “when [the voltage] falls to a range below approximately 0.4 V,” but the other characteristic parameters listed likewise remain within the category of detecting a condition indicative of fuel-cell malfunction. Reference to the well-known matter ... of periodically increasing the fuel cell's moisture level does not alter this conclusion.

090621_hanrei.pdf (courts.go.jp)

<South Korea> Manufacturing According to a Prior Reference “Necessarily” Produces the Same Product as the Patented Invention ⇛ No Novelty

Original Ameblo publication: 2022-06-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12746441185.html

<South Korea>

If it is proven that manufacture according to the production method described in the prior reference “necessarily” produces the same product as the patented invention, novelty is denied.

Supreme Court, 2017 Hu 1304

Japan takes the same approach, but proving “necessity” is difficult.

⇒ The hurdle is high already at the stage of showing that the replication experiment follows the same manufacturing method as the prior reference.

IP High Court, 2020 (Ne) 10057 <Otaka>, “Ricoh Case” ⇛ First-Instance Finding of an Antimonopoly Act Violation Changed!!

Original Ameblo publication: 2022-06-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12748421034.html

IP High Court, 2020 (Ne) 10057 <Otaka>, “Ricoh Case”

⇒ The first-instance judgment finding an Antimonopoly Act violation and treating the injunction and damages claims as an abuse of rights was changed!!

“Even when remanufactured cartridges are installed in the plaintiff's printers, the remaining-toner display shows ‘?’ together with ‘Printing is possible.’ Users can therefore readily recognize that the remaining amount is not displayed because the cartridge is remanufactured, and are not found to harbor concerns that printing functionality is impaired .... Some users choose remanufactured products in light of the above functional difference—the absence of a remaining-toner display—and the price difference from genuine products.”

“By devising the shape of the electronic components, it is technically possible to manufacture components outside the technical scope of Inventions 1 through 3 at Issue, replace the plaintiff's electronic components with them, avoid infringement of the patents, and enable remaining-toner display.”

<Conclusion>

⇒ “It cannot be found that the sole purpose was to exclude recycled products from the market.”

“It cannot be found that the appellant, by an unreasonable and unnecessary act in the form of the rewriting restriction at issue, forced the appellees to remove the plaintiff's electronic components installed in the plaintiff's products and replace them with the defendants' components, thereby preventing the above exhaustion. Considering comprehensively the above findings and all other circumstances appearing in this case, the appellant's exercise against the appellees of injunction and damages claims based on the patents in relation to the defendants' electronic components cannot be said to contravene the Antimonopoly Act as interference with a competitor's transactions (Articles 19 and 2(9)(vi) of that Act; paragraph 14 of the General Designation). Nor can it be said to impede ‘the development of industry,’ the purpose of the Patent Act, or depart from the purpose of the patent system. Accordingly, it cannot be regarded as an abuse of rights.”

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12750619436.html

IP High Court, 2019 (Gyo-Ke) 10174 [Aerosol Generation Device] <Mori>

Even the Lipase judgment does not prohibit considering the description and drawings as necessary to clarify the meaning, etc. of defining features when assessing the support requirement!!

* The claim language was construed in light of the problem of the invention.

⇒ Support requirement: satisfied

(Excerpts from the judgment)

The support requirement is assessed by comparing the claims with the detailed description of the invention. As a premise for that comparison, however, when identifying the invention from the claims, if it is necessary to clarify the meaning or technical significance of the features defining the invention stated in the claims, consideration of the description and drawings as necessary should not be precluded. The Lipase judgment cited by the parties cannot be construed as prohibiting this. ...

The plaintiff argues that allowing a narrow construction of the claims based on the detailed description when assessing support would mean that, however broadly worded the claims, they would never fail the support requirement, defeating its purpose, and would also allow infringement to be asserted on the basis of broad claims, creating an improper double benefit. However, even where the detailed description is considered in assessing support, a violation of the support requirement can still arise if the content of the invention recognized from the claims with reference to the detailed description is not supported by that description (for example, where the invention recognized from the claim language with reference to the detailed description includes both A and B, but only B appears in the examples, etc., A may be found unsupported). Thus, failure to meet the support requirement is not invariably avoided. Further, because the description and drawings are to be taken into account when determining the technical scope of a patented invention (Patent Act, Article 70(2)), the double benefit alleged by the plaintiff cannot be said to arise.

IP High Court, 2021 (Gyo-Ke) 10056 [Information Processing Device Case] <Shoji>

* The other component of the subcombination claim does not limit the configuration of the claimed invention in any way.

⇒ Not a feature defining the invention!!

⇒ The trial decision finding lack of novelty was upheld, identifying the gist of the invention after excluding elements specifying only server processing.

(Excerpts from the judgment)

In a subcombination invention, the gist of the invention must be identified by understanding what significance matters concerning the “other apparatus” stated in the claim have in defining the claimed invention in terms of shape, structure, components, composition, actions, functions, nature, characteristics, conduct or operation, use, etc. (collectively, “structure, functions, etc.”). Where those matters specify only the “other apparatus” and do not specify any structure, functions, etc. of the claimed invention, they have no significance in defining that invention, so it is appropriate to exclude them when identifying its gist ....

The wording in Element (B), “as first information including information serving as the basis for the server's extraction of second and third information,” merely specifies processing at the server (Elements (C1) and (C2)), namely that the server receiving notification of the first information extracts the second and third information from it. It does not specify that the first information itself includes any special information differing from an ordinary publication for extracting the second and third information. Thus, this wording in Element (B) of the amended invention at issue specifies server processing, not the content of the publication-notification means provided in the information processing device. It is therefore appropriate to exclude that wording when identifying the features defined by Element (B), and the trial decision's identification as (B') is not erroneous.

IP High Court, 2020 (Gyo-Ke) 10128 [Safety Confirmation System] <Shoji>

A difference was overlooked ⇒ JPO decision revoked

In the claimed invention, the lighting device has a transmitter and follows safety-notification rules corresponding to the ID of the identified installation location.

The cited invention has a detector ID for the lighting device, but cannot identify the installation location, so additional information is necessary.

Amendments deleting features from independent claims upon entry into the European phase face strict requirements. The same applies to divisional applications.

Original Ameblo publication: 2022-06-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12750963164.html

<Blog of German Patent Attorney Kan Hasegawa>

Under the European Patent Office Guidelines, an amendment of this kind that deletes features from an independent claim as filed is not allowed unless three requirements are satisfied (GL H-V, 3.1; T 0331/87).

(* Here, “as filed” means at the time the PCT application was filed.)

The practice in Japan of “filing a divisional application with a challenging claim that deletes several features from original claim 1 of the parent application” is, in principle, not possible at the European Patent Office. (GL C-IX, 1.4)

In Europe, deleting features from independent claims as filed is extremely difficult | Random Thoughts on European Intellectual Property Practice (hasegawa-ip.com)

IP High Court, 2019 (Gyo-Ke) 10108 [Control Channels in a Communication Network System] <Kanno>

Original Ameblo publication: 2022-07-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12751142341.html

IP High Court, 2019 (Gyo-Ke) 10108 [Control Channels in a Communication Network System] <Kanno>

① An example in which a correction abstracting an embodiment and incorporating it into the claims was held not to add new matter.

The specific disclosure in Figure 4 was abstracted.

The relationship between the problem addressed by the invention and the corrections was not a focus of attention.

⇒ Although the correction did not add new matter, it substantially changed the scope of the claims. The court therefore upheld the JPO decision refusing the correction and dismissed the plaintiff's claim.

② A correction adding claim language was held to constitute a substantial change in the scope of the claims.

(Excerpts from the judgment)

① ... Taking Figure 4 together with the above statements in the description, it can be said that the following is tantamount to being disclosed regarding the proportions of control-channel candidates available for scheduling that are restricted by the tree structure: in the embodiment in Figure 4, at aggregation level 1, the highest level, the 24 control channels are restricted to four candidates (a candidate proportion of one-sixth); at aggregation level 2, a relatively lower level, the 12 control channels are restricted to four candidates (a candidate proportion of one-third); and at aggregation level 4, the six control channels are restricted to four candidates (a candidate proportion of two-thirds); while the three control channels at aggregation level 8 are not restricted (a candidate proportion of one).

② ... Corrected claim 1 adds the concept of "control-channel candidates available for allocation to user equipment," which was not in the claims before correction, and then adds the following matters: "performing allocation to user equipment by making the proportion of control-channel candidates available for allocation to user equipment at each level lower than said highest level greater than the proportion of control-channel candidates available for allocation to user equipment at said highest level," and "the lower the level in the tree structure, the greater the proportion of control-channel candidates available for allocation to user equipment." As a result, the defining features of the invention now include making the proportion of control-channel candidates available for allocation to user equipment greater at lower levels in the tree structure, whereas the method before correction had made no particular provision regarding allocation at the relatively lower levels represented by the tree structure .... Accordingly, Corrections 1 through 3 substantially change the scope of the claims and cannot be regarded as complying with Article 126(5) of the Patent Act.

IP High Court, 2020 (Gyo-Ke) 10037 [Gaming Machine] <Otaka>

Original Ameblo publication: 2022-07-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12751507838.html

IP High Court, 2020 (Gyo-Ke) 10037 [Gaming Machine] <Otaka>

* Even where the passages come from the same primary cited document, new technical matters cannot be asserted in an action to revoke the JPO decision.

“This changes, at the stage of this litigation, ... the grounds for refusal stated in the JPO decision ... and the assertion itself should not be permitted simply because the primary reference is the same.” — ★ Does binding effect not extend to this?

Claimed invention: the jackpot is revealed “when the button is pressed for the first time.”

Cited reference: each time the button is pressed, a character with a higher expected chance appears; finally, a school doctor with a 100% expected chance appears.

⇒ Because they differ, novelty affirmed (inventive step was not discussed).

(Excerpts from the judgment)

... The defendant's above assertion is nothing other than an assertion that the amended claimed invention lacks novelty based on an invention relating to Technical Matter A that differs from the cited invention identified in the JPO decision as the invention described in Cited Document 1. It changes the grounds for refusal of the application stated in the JPO decision at the stage of this litigation. Allowing such a change in the grounds for refusal would deprive the appellant of the opportunity to defend itself in the proceedings for an appeal against a decision of refusal (Articles 159(2) and 50 of the Patent Act). Therefore, the assertion itself should not be permitted simply because the primary reference is the same ....

IP High Court, 2016 (Gyo-Ke) 10078 [System for Managing Combined Execution of Instruction Threads] <Mori>

Original Ameblo publication: 2022-07-06

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12752023242.html

IP High Court, 2016 (Gyo-Ke) 10078 [System for Managing Combined Execution of Instruction Threads] <Mori>

The symbol “(S, C)” in the claim wording “type (S, C),” added by amendment, was narrowly interpreted as “(service type, computation type),” avoiding an addition of new matter.

★ The JPO's argument: if the intention was to specify the types of instruction threads, ... the wording should have been “type (computation type, service type).”

⇒ To be safe, claim language should describe matters in words, not symbols!!

(Excerpts from the judgment)

When the meaning of the terms used in the claims is interpreted in light of the original description and other documents, the wording “type (S, C),” used for instruction-thread types in amended claims 6–8, can be understood to mean “service type” and “computation type.” ... This amendment changes “type” of instruction threads in claim 6 before amendment, which did not state what kinds of types existed, to “type (S, C),” meaning “type (service type, computation type)” described in the original description and other documents, and does not go beyond the matters described in the original description and other documents.

Osaka District Court, 2020 (Wa) 7486 [Apparatus and Method for Instantaneous Removal of Blood from a Fish by Injecting High-Pressure Water into the Hemal Arch] <Sugiura>

Original Ameblo publication: 2022-07-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12752842092.html

Osaka District Court, 2020 (Wa) 7486 [Apparatus and Method for Instantaneous Removal of Blood from a Fish by Injecting High-Pressure Water into the Hemal Arch] <Sugiura>

Joint inventorship affirmed ⇒ Claim for transfer of an ownership share granted.

Feature ①: although prompted by seeing the defendant's prototype, it was based on the plaintiff's conception and its embodiment.

Feature ②: although the defendant's idea was adopted, the plaintiff also made a creative contribution.

(Excerpts from the judgment)

The inventions at issue concern an apparatus and method for dispatching live fish that enable blood to be removed instantly, simply and reliably from fish of any size. They are recognized as a fish-bleeding apparatus and method characterized by ① bleeding fish by injecting pressurized high-pressure liquid from the hemal arch in the fish's tail into blood vessels, including arteries or veins (hereinafter “Characteristic Feature ①”), and ② making the nozzle tip tapered in order to achieve a close-contact sealing structure at the hemal arch accommodating fish of all sizes while suppressing damage to the nozzle tip (hereinafter “Characteristic Feature ②”). ...

Although Characteristic Feature ① of the inventions was prompted by the plaintiff's exposure to the foot-operated prototype made by the defendant, it may be said to be based on the plaintiff's conception and its embodiment, against the background of many years working at a fisheries company and, in particular, practical experience dispatching live fish. Therefore, not only the defendant but also the plaintiff should be regarded as having contributed creatively to the completion of Characteristic Feature ① of the inventions. ...

As to Characteristic Feature ②, although it was ultimately completed as an invention based on the defendant's idea, not only the defendant but also the plaintiff should be regarded as having contributed creatively during the process of conceiving a solution to the problem and embodying it. ...

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-90980.pdf

IP High Court, 2010 (Gyo-Ke) 10265 [Socks] <Takizawa>

Original Ameblo publication: 2022-07-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12752842372.html

IP High Court, 2010 (Gyo-Ke) 10265 [Socks] <Takizawa>

* Wording such as “substantially,” which was not in the original priority description, was added to the description, but it “does not affect the V-shape or structure” of the socks. “... Compared with the invention described in the original priority description, ... the scope of rights under claims 1 and 3 has not ... been broadened.”

⇒ Priority affirmed.

* Under this judgment, adding new matter to a description constitutes a ground for invalidity of claims that are broadened thereby. In practice, it should be noted that, since the Artificial Nipple case, there has been no judgment finding invalidity based on new matter added to the description without a change to the claims.

(Excerpts from the judgment)

For example, the statement “In the explanation of Figure 1 above, ‘substantially the same number’ means that a difference of approximately 10% of the number of knitting needles involved in knitting is permissible between the decrease or increase in the number of needles when the needle cylinder rotates in the forward direction and the decrease and increase in the number of needles when it rotates in the reverse direction” (paragraph [0016] of the corrected description), and the statement “The decreases in the number of needles in the forward and reverse directions are substantially the same” (paragraph [0018]), are not in the original priority description. However, “substantially” here does not refer to the V-shape in either case; it refers to the difference between the decrease or increase in the number of needles when the needle cylinder rotates forward and the decrease or increase when it rotates in reverse. Since the V-shape is defined by connecting lines HJ and HM, or NT and VN, which are the turning ends upon forward rotation, differences in increases or decreases in needle numbers between forward and reverse rotation do not affect the V-shape or structure. Accordingly, it cannot be said that the scope of rights under claims 1 and 3 of the corrected invention is broader than that of the invention described in the original priority description.

Original Ameblo publication: 2022-07-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12753184291.html

IP High Court, 2020 (Gyo-Ke) 10015 [Novel Formulations for Stabilizing Immunogenic Compositions and Inhibiting Precipitation] <Tsuruoka>

* After determining that the effect incorporated into the claims was a defining feature of the invention, the court held that it was not readily conceivable.

* The court rejected the “ease of discovering the problem of inhibiting silicone-induced aggregation” addressed by the invention. ⇒ Inventive step affirmed.

[Claim 1] A formulation comprising a polysaccharide–protein conjugate comprising ... that inhibits silicone-induced aggregation of the protein conjugate.

(Excerpts from the judgment)

In light of the ... disclosures in the description, the technical significance of the defining feature that the formulation of the invention produces the effect of inhibiting silicone-induced aggregation is understood as follows. ① Free pneumococcal conjugates are involved in silicone-induced aggregation regardless of pneumococcal serotype. ② Because the formulation of the invention has the composition in (i)–(iii), the pneumococcal CRM conjugates and aluminum salts bind in solution, leaving a relatively reduced amount of free pneumococcal CRM conjugates. ③ Being in the state described in ② inhibits silicone-induced aggregation arising through the mechanism in ①. ...

The defining feature of the invention relating to Difference 4, namely, “inhibiting silicone-induced aggregation of polysaccharide–protein conjugates contained in a siliconized container,” means that silicone-induced aggregation involving free pneumococcal CRM conjugates is inhibited because pneumococcal CRM conjugates and aluminum salts bind, reducing the amount of free pneumococcal CRM conjugates in solution to the intended level. In contrast, ... a person skilled in the art encountering Publicly Known Invention 1 would merely recognize that its formulation contains pneumococcal CRM conjugates adsorbed onto aluminum phosphate; it would not have been easy to recognize the presence or absence, and amount, of free pneumococcal conjugates in its formulation solution in relation to the problem of silicone aggregation involving free pneumococcal conjugates. Moreover, the amount of free pneumococcal CRM conjugates in the formulation of the invention may vary according to the amount of pneumococcal CRM conjugates of the six serotypes added to the 7vPnC of Publicly Known Invention 1, and also according to the ease with which each added serotype adsorbs onto aluminum salts. Thus, a person skilled in the art could not predict from Publicly Known Invention 1 even whether free pneumococcal CRM conjugates would be present in a solution of a formulation having the composition of the invention. Consequently, neither could that person predict whether silicone-induced aggregation involving free pneumococcal CRM conjugates would be inhibited in a formulation having the composition of the invention.

... The plaintiff ... argues that Difference 4 is substantially a point of identity and is not a difference. However, ... it cannot necessarily be said, as the plaintiff argues, that one could understand that aggregation might occur but would ordinarily be inhibited; much less can one definitively determine whether that aggregation is induced by silicone. In contrast, the invention expressly identifies silicone-induced aggregation as the cause of aggregation of 13vPnC and makes inhibition of that aggregation a defining feature of the invention. In this respect, there is a difference from Publicly Known Invention 1. ...

B. Ease of discovering the problem of inhibiting silicone-induced aggregation

The plaintiff argues that silicone-induced aggregation in protein formulations was known and that a person skilled in the art understood protein aggregation to be the driving force behind polysaccharide–protein conjugate aggregation. Therefore, it argues, silicone-induced aggregation was foreseeable in a 13-valent pneumococcal CRM conjugate formulation whose protein content was increased by adding six types of pneumococcal CRM conjugates to Publicly Known Invention 1. However, the publicly known documents ... on which the plaintiff relies merely describe aggregation associated with structural instability of polysaccharide–protein conjugates whose carrier protein is CRM or tetanus toxin (TT). Thus, these documents do not establish that silicone-induced aggregation of polysaccharide–protein conjugates was recognized as a problem by persons skilled in the art at the priority date.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12753325997.html

IP High Court, 2008 (Gyo-Ke) 10304 [Oxygen Absorbent for Incorporation into Resin] <Takizawa>

* Enablement requirement for a use invention

⇒ The purpose, constitution and effects of the invention must be described sufficiently to substantiate the usefulness of the use.

⇒ A description sufficient to substantiate that the invention produces its intended functions and effects for the relevant resins generally is necessary.

(Excerpts from the judgment)

... In an invention such as the present invention, concerning a composition used for a specific purpose (incorporation into resin) and consisting of known substances at specified composition ratios, merely identifying the substances constituting the composition and their composition ratios generally does not enable a person skilled in the art to predict the usefulness of that use, and the composition cannot readily be put into practice for that use. Accordingly, for such an invention to satisfy the enablement requirement, it is appropriate to construe the requirement as demanding that the detailed description state the purpose, constitution and effects of the invention sufficiently to substantiate the usefulness of that use.

Furthermore, because the invention specifies its use merely as “for incorporation into resin,” and because the invention must be described in a manner satisfying the enablement requirement, the detailed description should be construed as requiring a description sufficient to substantiate that applying the invention's oxygen absorbent is useful for resins generally to which an oxygen absorbent is applied; that is, that the invention produces its intended functions and effects for such resins generally.

IP High Court, 2019 (Gyo-Ke) 10026 [Fluid-Pressure Cylinder and Clamping Device] <Tsuruoka>

Original Ameblo publication: 2022-07-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12753746056.html

Trial and Appeal Practitioners Study Group 2021, Case 1, p. 12

IP High Court, 2019 (Gyo-Ke) 10026 [Fluid-Pressure Cylinder and Clamping Device] <Tsuruoka>

The matter deleted by amendment is the principal means of solving the invention's problem.

⇒ Violation of amendment requirements.

— If the principal and subordinate roles of components are expressly stated, the principal component is held to be essential, making an amendment/division deleting it impossible.

(Excerpts from the judgment)

The amendment includes, with respect to an “opening/closing valve mechanism” having a “valve body,” deletion from pre-amendment claim 1 of the defining feature “comprising a valve seat against which this valve body can abut, a fluid-pressure introduction chamber that maintains said valve body advanced toward said output member by the fluid pressure of said fluid chamber, and a fluid-pressure introduction passage communicating said fluid chamber with said fluid-pressure introduction chamber,” and the new introduction of the defining feature “including ... an elastic member that elastically biases said large-diameter shaft portion of said valve body toward said fluid chamber and maintains said valve body advanced toward said fluid chamber.” Therefore, amended Invention 1 also includes a configuration that uses only an elastic member, without a fluid-pressure introduction chamber and passage for utilizing the fluid pressure of the fluid chamber, as the configuration maintaining the valve body advanced toward the output member ....

... In Embodiment 2, the hydraulic-pressure introduction chamber 53 and hydraulic-pressure introduction passage 54 can be said to be components linked to the effects of the invention. ...

... The configuration of Embodiment 2 uses biasing by hydraulic pressure, provided through the hydraulic-pressure introduction chamber 53 and passage 54, as its principal means, and uses biasing by compression coil spring 53a as a supplementary means .... It must be said that one cannot derive from such a configuration a configuration that deliberately eliminates the principal hydraulic-biasing components and provides biasing solely through the compression coil spring, which is merely supplementary. This is all the more so considering ... that, in Embodiment 2, the hydraulic-pressure introduction chamber 53 and passage 54 are described in connection with the effects of the invention. ...

A configuration that maintains the valve body advanced toward the output member solely by an elastic member, without providing a fluid-pressure introduction chamber and passage in the opening/closing valve mechanism, cannot be regarded as a technical matter derivable by a person skilled in the art from all the statements in the original description and other documents taken together.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12754330332.html

Trial and Appeal Practitioners Study Group 2021, Case 8, p. 96

IP High Court, 2017 (Gyo-Ke) 10006, 10015 [Run-Flat Tire] <Takabe> — Clarity requirement satisfied

The clarity requirement is satisfied even if the calculation method causes a minute difference.

The intersection temperature differs by only 1°C depending on how the lines are drawn. ... It cannot be regarded as so unclear as to unduly prejudice third parties' interests.

(Excerpts from the judgment)

[Claim 1] ... A run-flat tire ... in which the temperature at the intersection of extrapolated line A and ... extrapolated line B is at least 170°C ....

... The temperature of 170°C specified as the intersection temperature of extrapolated lines A and B was derived by focusing on the variation in the dynamic storage modulus of the reinforcing rubber composition from 180°C to 200°C, and this intersection temperature differs by only 1°C depending on how the lines are drawn. Accordingly, the claim language specifying the constitution of the rubber composition by the intersection temperature of extrapolated lines A and B cannot be regarded as so unclear as to unduly prejudice third parties' interests.

IP High Court, 2021 (Gyo-Ke) 10111 [Laser Processing Apparatus] <Kanno>

Original Ameblo publication: 2022-07-23

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12754825876.html

IP High Court, 2021 (Gyo-Ke) 10111 [Laser Processing Apparatus] <Kanno>

The absence of a “groove” can be discerned from the drawings in the description ⇒ A claim correction excluding the configuration “in which a groove is formed” is permitted.

(The first court decision in which “non”-existence could be read from drawings.)

⇒ A “groove” is an essential component of the primary reference, and there is a teaching away from its removal. Inventive step affirmed.

(Excerpts from the judgment)

<Addition of new matter>

Correction 1 merely excludes from the invention of claim 1 before correction the conceptually encompassed “silicon wafer in which a groove along said planned cutting line is formed in the silicon single-crystal structure portion,” or a groove-essential apparatus. Thus, Correction 1, whose purpose is to narrow the scope of the claims, does not add a new technical matter to the “laser processing apparatus” of the invention of claim 1. Even in light of the description, ... Figures 1 and 3 are plan views depicting planned cutting lines on workpiece 1, while neither Figure 2, a cross-sectional view along line II–II in Figure 1, nor Figure 4, a cross-sectional view along line IV–IV in Figure 3, shows a groove being formed. ... In Figures 1 through 4, “planned cutting lines” are depicted but “grooves” are not. If the invention before correction presupposed the presence of “grooves,” it would be unnatural to depict “planned cutting lines” yet deliberately omit “grooves.”

<Inventive step>

It is inconceivable that a person skilled in the art encountering Exhibit Ko 11 would eliminate from substrate 201 the grooves 203 that generate the internal stress used to cut a semiconductor wafer. There is not only no motivation to adopt as the workpiece a substrate 201 having no grooves along the break lines and modify it to form a processing-altered region inside substrate 201, whose surface has no grooves; rather, there is a teaching away from such a modification ....

IP High Court, 2015 (Gyo-Ke) 10206 [Base Fabric for Airbags] <Takabe>

Original Ameblo publication: 2022-07-23

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12754826208.html

IP High Court, 2015 (Gyo-Ke) 10206 [Base Fabric for Airbags] <Takabe>

<JPO decision>

Because this is an existing product optimized for its function, a corresponding motivation is required to modify it.

⇒ Inventive step affirmed.

<This judgment>

There is motivation to move the numerical values of the publicly worked product toward those of the invention, but the required extent of the change is unknown.

⇒ Inventive step affirmed.

(Excerpts from the judgment)

Difference 1B: dynamic air permeability. In Invention 1 it is “1,300 mm/s or less,” whereas in the cited invention it is “1,498 mm/s.”

Difference 1C: yarn pull-out resistance. In Invention 3 it is “146–200 N/cm/cm,” whereas in Cited Invention 1 it is “53 N/cm/cm.”

<JPO decision (conclusion: inventive step affirmed; upheld)>

Even if the problem is well known, the invention of Exhibit Ko 1 is an “existing product” optimized for its function, so a corresponding motivation is considered necessary to modify it. It cannot be said that there is motivation to modify its boiling-water shrinkage, individual filament fineness, yarn pull-out resistance and cover factor, which influence dynamic air permeability, within the ranges specified by Invention 1 to bring the dynamic air permeability into the specific range of “1,300 mm/s or less”; nor is there evidence showing this to be possible.

<This judgment>

(b) Increasing the cover factor

... It can be said that, at the priority date, a person skilled in the art would attempt to increase the cover factor of Cited Invention 1 above 2,131 in order to reduce yarn slippage at the sewn boundaries during airbag inflation and deployment and reduce dynamic air permeability after loading. However, the evidence does not establish the relationship between the degree of increase in cover factor and the degree of decrease in dynamic air permeability after loading; nor does it indicate that common general technical knowledge on this point existed at the priority date. Therefore, it is unknown how far the cover factor of 2,131 in Cited Invention 1 must be raised to reduce its dynamic air permeability after loading from 1,498 mm/s ... to 1,300 mm/s or less. It is conceivable that the cover factor would need to be raised above the upper limit of the 2,100–2,500 range described ... as more preferable in Invention 1 “from the standpoint of compatibility between deployment performance and productivity.” Moreover, because the cover factor is calculated from the mean total yarn fineness and mean weave density in the warp and weft directions ..., changes to the cover factor can also affect the total yarn fineness. ...

(c) Increasing yarn pull-out resistance

... It can be said that, at the priority date, a person skilled in the art had motivation to increase the yarn pull-out resistance in Cited Invention 1 to reduce yarn slippage at sewn boundaries during airbag inflation and deployment and reduce dynamic air permeability after loading. However, the evidence does not establish how far the mean warp/weft yarn pull-out resistance of 53 N/cm/cm in Cited Invention 1 must be raised to reduce its dynamic air permeability after loading from 1,498 mm/s ... to 1,300 mm/s or less. It is also unknown whether raising it to 200 N/cm/cm, the upper limit of that mean value in Invention 1, stated ... to ensure that “localized stress concentration in the constituent yarns no longer occurs and airbag rupture is not caused,” would suffice. It is conceivable that it might need to be raised above that upper limit.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-86260.pdf

IP High Court, 2013 (Gyo-Ke) 10275 [Vulcanized Rubber Composition] <Ishii>

Original Ameblo publication: 2022-07-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12755163026.html

IP High Court, 2013 (Gyo-Ke) 10275 [Vulcanized Rubber Composition] <Ishii>

Even without recognizing the invention's problem, inventive step is denied if the invention's "configuration" can readily be conceived.

"It is sufficient to be able to explain rationally how the configuration of Invention 1 is reached; there is no need to follow the same thought process as that actually leading to Invention 1, such as recognizing its problem."

(Excerpts from the judgment)

The defendant argues that Exhibits Ko 1 through Ko 3 do not disclose the problem of Invention 1, namely improving the balance of rolling-resistance characteristics, handling stability and durability in a vulcanized rubber composition containing chemically modified microfibrillated cellulose, and provide no suggestion of using rubber components such as natural rubber to solve that problem; therefore, it cannot be said that a person skilled in the art could readily have conceived the configuration of Invention 1. ... However, ... the statements in Exhibit Ko 3 can be understood to show that solving the problem of improved dispersibility by using modified microfibrillated cellulose applies generally to hydrophobic media, such as various polymers conventionally used as materials for different products. Thus, there is motivation to replace the styrene-butadiene copolymer in Invention A of Exhibit Ko 3 with a well-known rubber component such as natural rubber. In assessing the obviousness of Invention 1, it is sufficient to be able to explain rationally how its configuration is reached from Invention A of Exhibit Ko 3; there is no need to follow the same thought process as that actually leading to Invention 1, such as recognizing its problem.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-84497.pdf

IP High Court, 2018 (Gyo-Ke) 10108 [Waste Treatment Method] <Takabe>

Original Ameblo publication: 2022-07-26

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12755339448.html

IP High Court, 2018 (Gyo-Ke) 10108 [Waste Treatment Method] <Takabe>

* Inherent as a self-evident problem of the cited invention.

“Even if not ... expressly stated in Cited Reference 1 ... it is inherent as a self-evident problem .... The cited invention and the technology of Exhibit Ko 2 share the problem to be solved of preventing leaching of heavy metals from waste.”

(Excerpts from the judgment)

... It is recognized that the possibility that the “organic waste” treated in the cited invention may also contain heavy metals, and prevention of their leaching, are matters that a person skilled in the art would naturally consider in the technical field of the cited invention. Even though this is not expressly stated in Cited Reference 1, which focuses on separation of treated waste from liquid, it is inherent as a self-evident problem of the cited invention .... The cited invention and the technology of Exhibit Ko 2 share the problem to be solved of preventing leaching of heavy metals from waste ....

... Exhibit Ko 2 does not state that a tobermorite structure is formed as a layer on the solid matter of said organic waste .... It is not established that it was well-known technology for a tobermorite structure to be “formed” as a “layer” “on the solid matter of said organic waste”; ... the configuration of the claimed invention relating to Difference 2′ cannot be reached by applying the technology of Exhibit Ko 2 to Cited Invention 1.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-88951.pdf

IP High Court, 2012 (Gyo-Ke) 10005 [Glucosamine-Containing Poultice] <Shiotsuki>

Original Ameblo publication: 2022-07-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12755495414.html

IP High Court, 2012 (Gyo-Ke) 10005 [Glucosamine-Containing Poultice] <Shiotsuki>

The cited invention limits the crosslinking agent to one suitable for solving problems specific to vitamin C.

⇒ Even if glucosamine and vitamin C are known as skin-whitening agents, their physicochemical properties, such as chemical structures, are not necessarily similar.

⇒ Modification is difficult.

(Excerpts from the judgment)

... Cited Invention A limits the crosslinking agent to one suitable for solving problems specific to using vitamin C or its derivatives as an active ingredient, and concerns a poultice characterized by a particular combination of active ingredient and crosslinking agent. ... Even though glucosamine and vitamin C ... have both long been known as typical skin-whitening agents ..., glucosamine does not have physicochemical properties, such as chemical structure, similar to those of vitamin C. Therefore, their interactions with a metal crosslinking agent in a poultice cannot be considered similar.

IP High Court, 2016 (Gyo-Ke) 10152 [Charge Control Agent] <Mori>

Original Ameblo publication: 2022-07-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12755885240.html

IP High Court, 2016 (Gyo-Ke) 10152 [Charge Control Agent] <Mori>

<Novelty>

Reproduction of the cited reference rejected.

— Identity of the starting material and manufactured substance denied.

The defendant had been selling an iron complex compound under the product name “T-77” since before the patent application ... relating to the invention of Exhibit Ko 1, but has never sold a product named “Aizen Color T-77” ....

(Excerpts from the judgment)

[Claim 1] ... A charge control agent ... having an electrical conductivity of 110 μS/cm or less when the metal complex compound is dispersed at 1% by weight in ion-exchanged water ....

<Clarity requirement>

... The electrical conductivity difference between measurement samples 1 and 2, prepared under different dispersion conditions, is only 1 μS/cm. Thus, these experimental results can be said to show that no marked difference can arise in the measured electrical conductivity even when different dispersion methods are used.

<Novelty>

... The defendant had been selling an iron complex compound under the product name “T-77” since before the patent application ... relating to the invention of Exhibit Ko 1, but has never sold a product named “Aizen Color T-77” .... It cannot be found that the Chinese corporation that performed the Exhibit Ko 4 experiment purchased “Aizen Color T-77” around April 1999 and kept it until the time of that experiment .... The starting material used in the Exhibit Ko 4 experiment cannot be found to be the same product as the “Aizen Color T-77” described in Exhibit Ko 1.

Original Ameblo publication: 2022-07-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12756022957.html

IP High Court, 2015 (Gyo-Ke) 10081 [Crystals of Pitavastatin Calcium Salt] <Takabe>

* The court did not accept the permissible error stated in the Commentary on the Japanese Pharmacopoeia.

⇒ Identity between the cited reference and the invention denied.

"... It cannot be said to have been common general technical knowledge among persons skilled in the art that values within ±0.2° could be regarded as identical."

(Excerpts from the judgment)

... Based on the statements in the Commentary on the 14th Japanese Pharmacopoeia ..., the JPO decision held that diffraction angles within ±0.2° could be regarded as identical. ...

The criterion of a permissible error "within ±0.2°" stated in the Commentary on the 14th Japanese Pharmacopoeia and in the 16th Japanese Pharmacopoeia cannot be construed as applicable generally to numerical diffraction-angle values measured by powder X-ray diffraction in patented inventions. Moreover, among patent applications specifying crystalline forms by numerical diffraction-angle values from powder X-ray diffraction measurements, some state only particular values in the claims without stating a permissible-error range, while others state such a range. The permissible-error ranges in the latter applications vary and are not limited to ±0.2° .... Therefore, the statements in the Commentary on the 14th Japanese Pharmacopoeia or the 16th Japanese Pharmacopoeia do not establish that, at the priority date, it was common general technical knowledge among persons skilled in the art that numerical diffraction-angle values measured by powder X-ray diffraction could be regarded as identical if they were within ±0.2°, when determining the identity of patented inventions. Accordingly, Invention 1 and the crystals of Exhibit Ko 3 cannot be regarded as identical.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-85691.pdf

IP High Court, 2015 (Gyo-Ke) 10256 [Backflow Prevention Device] <Shimizu>

Original Ameblo publication: 2022-07-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12756023264.html

IP High Court, 2015 (Gyo-Ke) 10256 [Backflow Prevention Device] <Shimizu>

* The mere possibility that a device having the same structure as the cited invention could perform the same operation as the invention at issue does not establish identity between the cited invention and the invention at issue.

... This means only that such operation is possible ...; it cannot be found ... that Exhibit Ko 2 describes the above operation.

(Excerpts from the judgment)

... The experimental report (Exhibit Ko 38-1) means only that a backflow prevention device having a structure similar to that shown in Figure 2 of Exhibit Ko 2 can be made to operate such that valve (23) does not open even when water solenoid valve (7) is closed, in a state without a pressure drop in the water supply. That experimental report does not establish that Exhibit Ko 2 describes shutoff device (16) of its invention as performing the above operation.

IP High Court, 2017 (Gyo-Ke) 10113 [... Foamable Composition] <Tsuruoka>

Original Ameblo publication: 2022-08-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12756387433.html

IP High Court, 2017 (Gyo-Ke) 10113 [... Foamable Composition] <Tsuruoka>

① The court recognized errors in the examples and found the enablement requirement satisfied.

* A case in which post-filing reproduction tests could not negate enablement.

* Reproduction-test results were submitted showing inability to solve the problem in an extreme case.

⇒ The premise was erroneous because the alcohol concentration is inherently subject to limitations.

② Although the numerical range's upper limit was not incorporated into the claims, the support requirement was satisfied because a practical upper limit could be contemplated.

(Extract from the judgment: ① Enablement requirement)

... For the composition invention, the description is found to provide specific disclosures enabling a person skilled in the art to produce and use the composition based on the description and common general technical knowledge at the filing date of the parent application; for the method invention, it similarly enables use of the method. ... Even considering the statement above the table, “The prepared solutions were evaluated for whether foam was generated and, if so, the generated foam was described as follows,” it is reasonable to consider that foam was generated in Examples 33–36 in light of their compositions and the entries in the “Foam evaluation/description/characteristics” column. Accordingly, it is appropriate to find that a person skilled in the art would understand “No” in the “Foam generation” column as likely a typographical error. Therefore, the plaintiff's arguments concerning the descriptions of Examples 33–36 are difficult to accept. ...

The plaintiff argues that, in an experiment it performed, no foam formed in a composition containing 99.5 v/v% ethanol and only 0.01 wt% bis-PEG-12 dimethicone as surfactant. However, compliance with the enablement requirement should be determined from the detailed description of the invention, premised on common general technical knowledge at filing. Unless those experimental results are recognized as common general technical knowledge at the time of filing the parent application of the patent, compliance or noncompliance cannot be proved on the basis of experimental results merely obtained after filing. Even setting this point aside, ... the invention may contain a second surfactant and a foam stabilizer in addition to alcohol, bis-PEG-[10-20] dimethicone or a mixture of bis-PEG-[10-20] dimethicones, and water. Thus, the alcohol concentration is inherently subject to limitations, and the plaintiff's argument, which fails to take such limitations into account, is erroneous in its premise.

(Extract from the judgment: ② Support requirement)

... The plaintiff argues ... that, when the concentration of lower alcohol is 99.99 wt% or close to that value, the problem of providing a foamable composition capable of forming stable foam cannot be solved. However, ... Invention 1 may contain a second surfactant and a foam stabilizer in addition to alcohol, bis-PEG-[10-20] dimethicone or a mixture of bis-PEG-[10-20] dimethicones, and water. Accordingly, Invention 1 should be understood as contemplating ... a practical upper limit on the alcohol concentration. ...

The plaintiff's argument is based on an erroneous premise ... that does not take account of ... the detailed description of the invention ....

<Article> “... The ‘Problem’ in the Support Requirement” (2019.6, Intellectual Property Management, Hideki Takaishi)

The standard for the support requirement: the Polarizing Film Grand Panel judgment.

⇒ The outcome depends on the level of abstraction at which the invention's problem is understood.

The trend shifted toward a pro-patent approach with the Pyrimidine Grand Panel judgment, and this continues as of 2022.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12758168407.html

IP High Court, 2020 (Gyo-Ke) 10077 [5-HT1A Receptor Subtype Agonists] <Otaka>

= Same year and case type, Nos. 10078 and 10082; Nos. 10079 and 10083; Nos. 10080 and 10084.

“The risk of various adverse events” does not constitute a “special circumstance” negating enablement.

The support requirement is also satisfied.

“Unless it is clear ... that administration should be avoided ..., it is sufficient that a person skilled in the art can understand that it has a therapeutic effect.”

(Excerpts from the judgment)

It is recognized that, at the filing date, it was common general technical knowledge that 5-HT1A receptor partial agonists generally had therapeutic effects on depressive episodes in bipolar disorder through their antidepressant action. ... In light of the realities of pharmaceutical development, the contents of the pharmaceutical approval-review system, and the fact that examination of the Patent Act's disclosure requirements (enablement and support) should be conducted with regard to the Act's purpose, under the first-to-file principle, of encouraging inventions and thereby contributing to industrial development through their protection and utilization, the following is sufficient for a pharmaceutical-use invention, which is a product invention, to be capable of being “worked” through “the act of using that product”: unless there are special circumstances, such as it being clear that administration should be avoided because administering the drug to patients suffering from the disease targeted by the pharmaceutical use creates a risk of serious side effects or adverse events, a person skilled in the art can understand from the detailed description and common general technical knowledge at filing that the drug has a therapeutic effect on the target disease ....

IP High Court, 2011 (Gyo-Ke) 10127 [Swing Clamp] <Shiotsuki>

Original Ameblo publication: 2022-08-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12758441320.html

IP High Court, 2011 (Gyo-Ke) 10127 [Swing Clamp] <Shiotsuki>

Claims 1 and 2 use the same claim wording as the basic application.

⇒ Priority is recognized!! (But inventive step is still denied.)

Added claim 3 adds new matter.

*Claim Differentiation

⇒ Assessed claim by claim, priority is denied only for the added claim as adding new matter.

(Excerpts from the judgment)

The claims for Invention 3 specify “in the swing clamp of claim 1 or 2,” thereby referring to the configuration of Invention 1 or 2 (a dependent claim). However, as to the guide grooves of the clamp rod, Invention 1 merely imposes the limitations “a plurality arranged at approximately equal intervals circumferentially,” “a plurality provided in the second sliding portion (12),” and “said plurality of guide grooves (26) each comprise a swing groove (27) and a straight groove (28) provided in succession from the other axial end to the one axial end, said plurality of swing grooves (27) being arranged parallel to one another and said plurality of straight grooves (28) being arranged parallel to one another.” Likewise, Invention 2 merely imposes a limitation on the number of clamp-rod guide grooves: “three or four of said guide grooves (26) are provided.”

Accordingly, Inventions 1 and 2 do not specify the inclination angle of the guide grooves. The fact that the defining feature of Invention 3 relating to that angle, “the inclination angle is within the range of 10 to 30 degrees,” is not disclosed in the descriptions (including drawings) of the first through third basic applications does not mean that Inventions 1 and 2 were specified, filed and registered as including that matter as a defining feature. This reasoning becomes clearer if, for example, one assumes that claim 3 (Invention 3) is deleted from the claims. Therefore, in light of the claims for Inventions 1 and 2 (claims 1 and 2), the patent application can be said to have been filed “based on an invention described in the description or drawings ... originally attached to the application” of the earlier application within the meaning of Article 41(1) of the former Patent Act. There is no reason why the plaintiff should lose the benefit of priority for Inventions 1 and 2, and the earliest priority date (... the filing date of the first basic application) may be used as the reference date for applying Article 29 of the Patent Act.

However, as determined regarding Grounds for Revocation 1 and 2 above, even using that date as the reference date, the patents for Inventions 1 and 2 are invalid for lack of inventive step based on the invention of Exhibit Ko 12 and other evidence.

IP High Court, 2021 (Ne) 10022 [Webpage Browsing Method] <Shoji>

Original Ameblo publication: 2022-08-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12758894838.html

IP High Court, 2021 (Ne) 10022 [Webpage Browsing Method] <Shoji>

“Area corresponding to an access point” = the location where the access point is installed and a certain area in its vicinity.

⇒ Reversed; claim elements not satisfied.

The first instance (2017 (Wa) 24942) found the claim elements satisfied.

= The area corresponding to the geographical extent of the physical network or similar infrastructure used by the access point assigning the IP address.

(Excerpts from the judgment)

... “Area corresponding to an access point” and similar expressions should be construed as “the location where the access point is installed and a certain area in its vicinity.” In principle, “a certain area in its vicinity” should be construed, assuming a dial-up connection, as the area in which communication is available at the same local-call rate, namely a unit charging area. ... The defendant's methods do not identify “the location where the access point is installed and the area in its vicinity”; thus, they do not use a database or the like providing a one-to-one correspondence between “IP address” and “area corresponding to an access point” (the access point's installation location and its vicinity), nor do they identify “the area to which the access point belongs” (the access point's installation location and its vicinity) ....

★ Extract from the first-instance judgment: Tokyo District Court, 2017 (Wa) 24942 <Sato>

“‘Area corresponding to an access point’ and similar expressions in Constituent Element 1B1 and other elements mean ‘the area corresponding to the geographical extent of the physical network or similar infrastructure used by the access point assigning the IP address.’”

Tokyo District Court, 2017 (Wa) 3569 [Solenoid] <Shimasue>

Original Ameblo publication: 2022-08-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12759081720.html

Tokyo District Court, 2017 (Wa) 3569 [Solenoid] <Shimasue>

* “Sealingly fitted” requires the end member itself to produce an effect preventing corrosion of the solenoid.

⇒ The claim element is not satisfied even if the effect is produced in combination with an O-ring.

⇒ Reversed on appeal (IP High Court, 2018 (Ne) 10034).

* Both the first instance and the appeal concern the interpretation of “sealingly fitted.”

(Excerpts from the judgment)

[Claim 1] ... A solenoid characterized by providing ... an end member made of corrosion-resistant material that is sealingly fitted into the mounting hole and closes its opening ....

... Because the degree of sealing required by “sealingly fitted” is not uniquely and clearly determined by the above alone, it should be interpreted taking into account the statements outside the claims and the drawings in the description (Article 70(2) of the Patent Act ...). ... The invention has a structure advantageous for corrosion resistance and is intended, among other things, to achieve high reliability and a long service life (paragraph [0014]). As the means to that end, it uses an end member made of corrosion-resistant material, sealingly fitted into the mounting hole in the housing member to close its opening, to inhibit ingress of the external atmosphere (fluids such as moisture and water) (paragraphs [0015] and [0016]). Its effect is to enable improved corrosion resistance of the solenoid (paragraph [0046]). Accordingly, the degree to which the end member is sealingly fitted into the mounting hole must inhibit ingress of the external atmosphere sufficiently to produce the effect of improving the solenoid's corrosion resistance. ...

... The defendant's product with the O-ring removed is not recognized as having the effect of inhibiting water ingress into the mounting hole .... In response, the plaintiff argues that the experiments in Exhibits Otsu 14 and 15 are meaningless because they show results under extreme conditions wholly different from those in which the defendant's product is actually used. However, as stated above, normal use of the defendant's product requires that the control valve remain free of corrosion for at least about ten years even in an environment exposed to sea breezes. Accordingly, experiments involving 400 hours of saltwater spray (Exhibit Otsu 14), or large amounts of water and vibration (Exhibit Otsu 15), cannot be said to show results under extreme conditions wholly different from normal use.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-87629.pdf

Appeal: IP High Court, 2018 (Ne) 10034 [Solenoid] <Kanno>

Original Ameblo publication: 2022-08-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12759244637.html

Appeal: IP High Court, 2018 (Ne) 10034 [Solenoid] <Kanno>

* “Sealingly fitted” does not require the end member itself to produce an effect preventing corrosion of the solenoid.

⇒ The claim element is satisfied because the effect is produced in combination with the O-ring.

⇒ The first instance found non-satisfaction (2017 (Wa) 3569 <Shimasue>).

* In both the first instance and the appeal, interpretation of “sealingly fitted” was at issue. ⇒ Opposite conclusions.

(Excerpts from the judgment)

[Claim 1] ... A solenoid characterized by providing ... an end member made of corrosion-resistant material that is sealingly fitted into the mounting hole and closes its opening ....

... The degree to which mechanical parts must be “fitted” so as to “seal tightly” to constitute “sealingly fitted” in the invention is not necessarily uniquely specified by the claims. Turning to the description to interpret the term, it states: “characterized by comprising an end member made of corrosion-resistant material that is sealingly fitted into said mounting hole and closes the opening thereof” (paragraph [0015]); and “As a result, the components of the solenoid housed inside the mounting hole and located farther inward than the end member are not exposed to the outside, and ingress of the external atmosphere (fluids such as moisture and water) is inhibited by the end member, making it possible to improve corrosion resistance in the state assembled to the mating housing member” (paragraph [0016]). In light of these statements, ... “sealing” in “sealingly fitted” refers to a degree that “inhibits” ingress of the external atmosphere (fluids such as moisture and water) ....

It is undisputed between the parties that the defendant's product ... has a sealing member at the outer end of the plate and, when housed in said mounting hole, has a configuration ... that seals between the body and the mounting hole to inhibit ingress of external air, moisture and other substances. ...

According to the results of the experiments in Exhibits Otsu 1 and 14, Ko 49 and 58, and Otsu 19 and 20, ingress of the external atmosphere (moisture, water and the like) is completely suppressed in the defendant's product having an end member and sealing member (O-ring). Accordingly, by fitting end member (H) into the opening at the upper side of the body, the defendant's product inhibits ingress of the external atmosphere; and by including the sealing member, it produces the further effect of sealing between the body and the mounting hole to inhibit such ingress more strongly. Therefore, the defendant's product also satisfies ... the wording “‘sealingly’ fitted.” ...

In response, the appellee argues, on the premise ... that “sealingly fitted” must inhibit ingress of the external atmosphere sufficiently for the end member itself to prevent corrosion of the solenoid, that the test results show that the defendant's product with the O-ring removed fails to inhibit ingress into the mounting interior. However, ... the appellee's interpretation of “sealingly fitted” in Constituent Element B6 is erroneous, so the argument lacks its premise and cannot be accepted.

Tokyo District Court, 2003 (Wa) 3552 [Quartz Crystal Resonator] <Takabe>

Original Ameblo publication: 2022-08-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12760644885.html

Tokyo District Court, 2003 (Wa) 3552 [Quartz Crystal Resonator] <Takabe>

(Claim 1) ... A quartz crystal resonator ... provided with ... a holding-container outer-surface positioning piece having a curved surface conforming to the shape of the outer surface of the holding container ....

* Construction of the claim phrase “a curved surface conforming to ...”

⇒ A shape producing the effect is sufficient; it need not coincide with the shape of the outer surface of the holding container.

(Excerpts from the judgment)

[Claim 1] ... A quartz crystal resonator characterized by being provided with ... a holding-container outer-surface positioning piece having a curved surface conforming to the shape of the outer surface of the holding container ....

The purposes of the invention are ① to prevent the quartz crystal resonator body from tilting during manufacture and causing the lead weld to come off, and ② to enable grounding of the holding container during mounting so that the quartz crystal resonator can be used with high resistance to noise. To those ends, it is characterized by i) positioning and molding the quartz crystal resonator body using an outer-surface positioning piece and a holding-container top-surface positioning piece (Constituent Element D), and ii) using said outer-surface positioning piece or holding-container top-surface positioning piece as an external terminal for grounding the resonator body (Constituent Element E).

Accordingly, the outer-surface positioning piece in Constituent Element B must also have a shape that enables positioning without tilting the quartz crystal resonator and can serve as an external grounding terminal; any shape meeting those conditions achieves the purpose. That is, the outer-surface positioning piece must have a curved surface conforming to the holding container's outer surface so that the resonator does not tilt during molding, and must contact the holding container so as to serve as an external grounding terminal. However, a shape capable of supporting the resonator is sufficient, and coincidence with the shape of the outer surface is not required.

https://www.nakapat.gr.jp/ja/legal_updates_jp/%E3%80%90%E7%89%B9%E8%A8%B1%E2%98%85%E2%98%85%E3%80%91%E3%80%8C%E8%96%AC%E5%89%A4%E5%88%86%E5%8C%85%E7%94%A8%E3%83%AD%E3%83%BC%E3%83%AB%E3%83%9A%E3%83%BC%E3%83%91%E3%80%8D%E4%BA%8B%E4%BB%B6%EF%BC%8D/

Osaka District Court, 2002 (Wa) 6178 [Artificial Kidney Perfusion Agent for Bicarbonate Dialysis] <Komatsu>

Original Ameblo publication: 2022-08-26

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12760813127.html

Osaka District Court, 2002 (Wa) 6178 [Artificial Kidney Perfusion Agent for Bicarbonate Dialysis] <Komatsu>

(Claim 7) ... An artificial kidney perfusion agent ... consisting of granules in which a plurality of sodium chloride particles are bonded through said coating layer ....

* Construction of the claim phrase “consisting of”

⇒ It is sufficient that granules are formed to an extent producing the effects.

⇒ Claim elements satisfied.

(Excerpts from the judgment)

... The invention selects a powdered form for Agent A used in an artificial kidney perfusion agent, rather than a solution form with problems concerning transport costs, storage space, disposal of containers and the like. To solve problems such as contamination by foreign matter and variation in component composition when a known granulation method is adopted to powder Agent A, it forms a uniform-composition “coating” containing as essential components the electrolyte compounds specified in its claims (claim 7), and uses that coating layer as a binder to bond sodium chloride particles together. This enables Agent A to be obtained with each component proportion at a substantially constant, specified value ....

... Accordingly, the “coating layer” in Constituent Elements A and B of the invention requires only that the surfaces of the sodium chloride particles be coated sufficiently to produce the above functions and effects (the uniformity asserted by the defendants likewise need only be satisfied to that extent), and does not require complete (100%) or nearly complete coverage. Similarly, “consisting of” in Constituent Element B requires only that granules in which a plurality of sodium chloride particles are bonded through the coating layer be formed sufficiently to produce those functions and effects; it does not require the complete absence of individual sodium chloride particles.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-10298.pdf

Osaka District Court, 2016 (Wa) 2688 [Coated Copper Wire for Ball Bonding]

Original Ameblo publication: 2022-08-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12761079089.html

Osaka District Court, 2016 (Wa) 2688 [Coated Copper Wire for Ball Bonding]

* The permissible range of impurities is the range within which the problem of the invention can be solved.

⇒ The permissible Pd content is approximately 2%.

“If the admixture of palladium is within approximately 2% ..., the problem-solving principle of the inventions, utilizing the relative melting points of the metals, remains applicable ....”

(Excerpts from the judgment)

... When palladium is used for the intermediate coating layer, ... the melting point rises above approximately 1,064°C as the palladium content increases, and exceeds copper's intrinsic melting point of approximately 1,085°C when the palladium content exceeds approximately 2% .... In light of this, if more than approximately 2% palladium (Pd) from the inner coating layer mixes into the surface coating layer formed of gold (Au), the problem-solving principle of the inventions, which utilizes the relative melting points of the metals, ceases to apply. Conversely, if palladium admixture is within approximately 2%, the melting point of the gold-palladium alloy is lower than that of copper (Cu), and the alloy's melting point reflects the intrinsic melting points of gold (Au) and palladium (Pd) as described above. Thus, the problem-solving principle utilizing the relative melting points of the metals remains applicable. Accordingly, where palladium (Pd) is used for the intermediate coating layer, a “skin layer of gold (Au)” need not consist exclusively of gold (Au), but, as the defendant argues in the alternative, it should be construed as requiring that palladium (Pd) admixture be no more than approximately 2%.

② The extremely low predictability of how changes in constituent elements or added amounts affect an alloy's properties.

③ Arguments during prosecution.

“Consisting essentially of ...”

⇒ Inclusion of elements affecting the alloy's characteristics is not permitted.

(Excerpts from the judgment)

... In light of the facts that ② alloys generally have extremely low predictability as to how changes in constituent elements or added amounts affect their properties, and ③ during prosecution, the plaintiff stated that increasing other elements in a Cu-Ni-Si-based alloy worsens electrical conductivity and bending characteristics, and that an alloy containing 0.39% tin (Sn) cannot be adopted because it reduces conductivity and therefore should be excluded from the technical scope of the invention, “consisting essentially of ...” in Constituent Element A should be construed as permitting, besides nickel (Ni), silicon (Si), magnesium (Mg) and copper (Cu), elements specifically described in the description and elements that a person skilled in the art could readily conceive based on its statements. It cannot, however, be construed as permitting elements beyond that scope that affect the alloy's characteristics. ... The zinc (Zn) and tin (Sn) in the defendant's product exceed in content the magnesium (Mg) specified in Constituent Element A, and cause differences in alloy characteristics by improving stress-relaxation resistance while reducing electrical conductivity. Accordingly, the defendant's product containing zinc (Zn) and tin (Sn) does not satisfy Constituent Element A.

Tokyo District Court, 2003 (Wa) 9102 [Nonaqueous Secondary Battery] <Iimura>

Original Ameblo publication: 2022-08-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12761336015.html

Tokyo District Court, 2003 (Wa) 9102 [Nonaqueous Secondary Battery] <Iimura>

[Claim 1] ... A nonaqueous secondary battery characterized by ... being eccentric.

Based on the active expression “make eccentric” in the description and other factors, the claim wording “being eccentric” was construed as excluding displacement of the degree inevitably arising during manufacture.

⇒ Claim element not satisfied. Equivalence not established.

[Claim 1] ... A nonaqueous secondary battery characterized by ... being eccentric.

(Excerpts from the judgment)

... In light of 〈1〉 the fact that a slight displacement inevitably arises in the center pin due to springback (see Exhibits Ko 26-1 and 26-2), and 〈2〉 the active expression “make eccentric” used for the center-pin tube in the detailed description of the invention, it is clear that “being eccentric” does not encompass a displacement of the degree of springback-induced bending back of the winding-end side relative to the winding-start end that inevitably results from bending metal.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12761511689.html

IP High Court, 2005 (Ne) 10052 [Electronically Detectable and Deactivatable Marker] <Tsukahara>

* Based on the meaning of “through-hole” in the description ...

⇒ The “cracks” in the defendant's product were formed accidentally when thinning the insulating layer to create a thin polyethylene portion, and therefore do not constitute the “through-hole” of Constituent Element J.

[Claim 1] ... A resonance label ... in which a predetermined short-circuit path is formed by at least one through-cut or through-hole (11) provided in said insulating layer (1) ....

(Excerpts from the judgment)

... In light of the statements in Description 2, Invention 2 is characterized by specifically cutting open a certain location in the insulator between electrodes by some method to form cuts or holes of certain sizes and spacing, so as to cause discharge at a specified location and deactivate the label. Accordingly, ... “through-cut or through-hole” should mean an opening formed by cutting open the insulating layer between the electrodes. The original judgment found that “cracks arise in the aluminum and polyethylene portions when the crater-shaped portion of the defendant's product is formed.” Those cracks are formed accidentally when thinning the insulating layer to create a thin polyethylene portion, so the “cracks” found by the original judgment cannot be said to constitute the “through-hole” of Constituent Element J.

Tokyo High Court, 2003 (Ne) 1223 [Method for Searching for Stable Complex Structures of Biological Macromolecules and Ligand Molecules] <Yamashita>

Original Ameblo publication: 2022-08-31

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12761687090.html

Tokyo High Court, 2003 (Ne) 1223 [Method for Searching for Stable Complex Structures of Biological Macromolecules and Ligand Molecules] <Yamashita>

Indirect infringement established for an exclusively used product.

"... Insufficient to establish that a use not employing ... is, according to common social understanding, an economic, commercial or practical use."

* Even if an exclusive license is established over the entire scope, the patentee retains the right to seek an injunction.

= Supreme Court, 2004 (Ju) 997 is to the same effect.

(Excerpts from the judgment)

Although SYBYL ... contains various tools necessary for molecular design, the findings made thus far readily establish that FlexX plays an extremely important, central role in molecular design. From the content and functions of Method B found above, it is clear that molecular design without using FlexX is hardly conceivable.

The expression "a product used exclusively for working that invention" in Article 101(ii) of the Patent Act means a product having no use other than use in the method invention. To rebut proof that it is "a product used exclusively for working that invention," it is insufficient merely to state that there is, in the abstract, a use other than use in the method invention; it is necessary to allege and prove facts sufficient to establish that the other use is, according to common social understanding, an economic, commercial or practical use .... However, as to SYBYL, ... even if it includes software other than FlexX, using SYBYL for purposes other than molecular design is not conceivable in practice. Given the importance of FlexX in molecular design described above, examination of all the evidence in this case reveals no evidence sufficient to establish that a use not employing FlexX is, according to common social understanding, an economic, commercial or practical use. ... When using FlexX (Method B), a method of searching for stable complexes using only hydrophobic interactions cannot be regarded as an economic, commercial or practical use according to common social understanding; FlexX (Method B) is used exclusively for a method of searching for stable complexes whose interactions include hydrogen bonding ....

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12761864534.html

Tokyo District Court, 2003 (Wa) 6742 [Narrow-Necked Bottle with Packaging Label] <Takabe>

[Claim 1] ... A narrow-necked bottle with a packaging label, characterized by ... incorporating an ultraviolet absorber into, or applying it to, a heat-shrink film ....

⇒ “Ultraviolet absorber” was narrowly construed as something maintaining transparency; the defendant's white product was held not to satisfy the claim element.

(Excerpts from the judgment)

... The description identifies as effects of the device that applying an ultraviolet absorber enables use of a transparent bottle and allows its contents to be inspected from outside the transparent bottle. ... Moreover, in a supplemental statement of reasons for the appeal against refusal, the applicant obtained the utility model right by emphasizing that the device differs from prevention of ultraviolet light through a light-shielding function described in Cited Document 3 ..., or by adding colorants or pigments or depositing aluminum as illustrated in Cited Document 4 ..., in that it prevents ultraviolet light while maintaining label transparency. Taken together, these circumstances indicate that “ultraviolet absorber” in the device is limited to substances that allow label transparency to be maintained when incorporated. ... The titanium oxide contained in the defendant's white ink is white and does not maintain transparency; for this reason as well, it cannot be considered an “ultraviolet absorber” in the device.

IP High Court, 2021 (Ne) 10007 [Infusion Preparation Containing Sulfur-Containing Compounds and Trace Metal Elements] <Honda>

First instance: Tokyo District Court, 2018 (Wa) 29802 <Tanaka>

Construction of the claim wording referring to multiple “chambers”: the product invention with the limitation “capable of communicating” was not satisfied, while the method invention without that limitation was satisfied.

The original judgment, which found both unsatisfied, was reversed.

Although the product and method claims were not in a dependency relationship, the presence or absence of “capable of communicating” led to differing conclusions on non-satisfaction and satisfaction. This decision can be viewed as consistent with the idea of “claim differentiation.”

⇒ Patentee prevailed.

https://www.nakapat.gr.jp/ja/legal_updates_jp/%E3%80%90%E7%89%B9%E8%A8%B1%E2%98%85%E3%80%91%E7%89%B9%E8%A8%B1%E6%A8%A9%E4%BE%B5%E5%AE%B3%E5%B7%AE%E6%AD%A2%E8%AB%8B%E6%B1%82%E6%8E%A7%E8%A8%B4%E4%BA%8B%E4%BB%B6%EF%BC%88%E8%A4%87%E6%95%B0%E3%81%AE/

IP High Court, 2019 (Ne) 10009 [Roll Paper for Packaging Medicine into Individual Doses] <Otaka>

Original Ameblo publication: 2022-09-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12762337041.html

IP High Court, 2019 (Ne) 10009 [Roll Paper for Packaging Medicine into Individual Doses] <Otaka>

The wording “used in ...” means “capable of being used in ...,” and is satisfied even without actual use in “...”.

Osaka District Court, 2018 (Wa) 3461

For the claim “a roll of packaging paper mountable in ...,” satisfaction of “mountable” was not even at issue!

⇒ The IP High Court decision in 2019 (Ne) 10031 <Mori>, involving a different defendant, is to the same effect.

* In the “Antenna” case, 2018 (Wa) 13400, “for ...” was construed as requiring actual use. ⇒ Claim element not satisfied.

(Excerpts from the judgment)

According to the claims of the corrected invention (claim 1), it is a product invention concerning “roll paper for packaging medicine into individual doses” (Constituent Element E) comprising the configurations in Constituent Elements A through D. Constituent Element A describes matters concerning the medicine packaging apparatus; Constituent Elements B and D describe matters concerning the “hollow core tube,” “roll paper” and “plurality of magnets” of the “roll paper for packaging medicine into individual doses” (collectively, “the roll paper and associated components”); and Constituent Element C describes matters concerning both. In Constituent Element A, the roll paper is described as “used in” a medicine packaging apparatus.

As to “used in” in Constituent Element A ..., the Japanese auxiliary “rareru” expresses possibility as well as the passive voice. In view also of the fact that claims for a product invention should be construed as specifying the product's structure, characteristics and the like, it is natural to construe this as meaning “capable of being used in.”

Next, the description contains neither a definition of “used in” in the wording “used in a medicine packaging apparatus” in Constituent Element A, nor any statement conflicting with the above interpretation.

Accordingly, “used in” in Constituent Element A should be construed as meaning “capable of being used in.”

* In Osaka District Court, 2018 (Wa) 3461, a separate case involving the same defendants, the claim wording was “a roll of packaging paper mountable in a medicine packaging apparatus equipped with magnetic detection means ...,” and satisfaction of “mountable” was not even at issue.

Separate case: Osaka District Court, 2018 (Wa) 3461 (February 18, 2021):

Tokyo District Court, 2002 (Wa) 9503 [Nucleic Acid Amplification Reaction Monitoring Apparatus]

Original Ameblo publication: 2022-09-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12762620891.html

Tokyo District Court, 2002 (Wa) 9503 [Nucleic Acid Amplification Reaction Monitoring Apparatus]

A case in which statements in the same applicant's later application were not taken into account.

⇒ Infringement.

* Although the obligation to refrain arising from the granted injunction covered the defendant's product as a whole, the analysis computer and color printer were excluded from destruction because they were general-purpose products.

(Excerpts from the judgment)

The defendant argues that, in the later application's description, it was emphasized that the apparatus of the later invention was superior in using no optical fibers and using a CCD camera as its optical system, whereas the apparatus described in the U.S. application on which the patent's priority claim was based used optical fibers. On that basis, the defendant argues that the technical scope of the invention is limited to apparatuses using optical fibers and no CCD camera as their optical system, and that a contrary assertion in this case is impermissible as violating good faith and related principles.

However, the technical scope of the invention must be determined based on the claims in its description. In doing so, the detailed description and drawings may be considered, but there is no rational reason to consider statements in the description of the later application, which is separate from this patent application. Further, even if the description of the later application gives a different explanation of the meaning of “optical system” in the invention, this cannot be said, in this case, to violate the principle of estoppel or good faith.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-11162.pdf

Osaka District Court, 2003 (Wa) 13703 [Hair Treatment Promoting Apparatus] <Yamada>

Original Ameblo publication: 2022-09-06

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12762820516.html

Osaka District Court, 2003 (Wa) 13703 [Hair Treatment Promoting Apparatus] <Yamada>

Construction of the claim wording “semicircular.”

⇒ In relation to the two effects stated in the description, whether the semicircular arc is “perfect” is immaterial.

⇒ The term includes approximately semicircular shapes that are substantially the same and produce the invention's effects, even if not perfectly semicircular.

⇒ Claim element satisfied.

(Excerpts from the judgment)

... In light of the effects to be produced by the configurations in Constituent Elements B and C, the “semicircular” heater and heating apparatus in Constituent Element B do not refer only to a “perfect” semicircular arc with a central angle of 180 degrees. If the shape is substantially the same and can produce those effects, the term should also encompass approximately semicircular arcs, such as those whose central angle is slightly less than 180 degrees or whose radius varies slightly from portion to portion.

That is, ... because the object being heated (the hair of the person undergoing treatment) is not a perfect hemisphere, no matter how “perfect” the heater's semicircular arc is, it is impossible in principle and practice to heat that person's hair strictly uniformly and without unevenness. Accordingly, it is also self-evident that whether the heater's semicircular arc is “perfect” has no significance.

Moreover, as to the shape of the heating apparatus, the purpose of reducing the space required during operation is ... to improve the working efficiency of practitioners in hairdressing and beauty salons, so this likewise does not require a “perfect” semicircular arc.

Therefore, “semicircular” in Constituent Element B should be construed, as above, as not limited to a perfect semicircular arc but also including approximately semicircular arcs that are substantially the same and produce the stated effects.

IP High Court, 2020 (Gyo-Ke) 10004; IP High Court, 2020 (Gyo-Ke) 10056

Original Ameblo publication: 2022-09-09

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12763366759.html

IP High Court, 2020 (Gyo-Ke) 10004

Patients receiving administration have creatinine clearance of at least 50 but less than 80 ml/min (mild renal impairment).

IP High Court, 2020 (Gyo-Ke) 10056

Patients receiving administration have creatinine clearance of at least 30 but less than 50 ml/min (moderate renal impairment).

⇒ Knowledge at filing that adverse reactions in patients with mild or moderate renal impairment were the same as in persons with normal renal function. Inventive step denied in both cases.

(Excerpts from the judgment)

... Since Condition (4) merely singles out, from among osteoporosis patients, a group satisfying all three conditions and confirms safety for that group, the three conditions and Condition (4) can be understood as independent conditions with different purposes. The plaintiff argues that the four conditions form an organically integrated whole, but ... this cannot be accepted. ...

... A person skilled in the art encountering Exhibit Ko 7, which expressly states that patients with severe renal impairment are excluded, would recognize that a considerable proportion of the patients receiving administration under the invention of Exhibit Ko 7 have mild or moderate renal impairment .... Furthermore, ... it is clear that confirmation of safety in patients with renal impairment was required for osteoporosis drugs as well. Thus, for a person skilled in the art encountering that invention, focusing on the renal function of the target patients is not exceptional, but something that person would naturally do. ...

Exhibit Ko 10 defines patients with “mild” renal impairment as patients with “GFR 50–79 ml/min,” treating those with creatinine clearance of 50–79 ml/min as having mild renal impairment. ... The review-results report ... classifies renal impairment using creatinine clearance as an indicator, along these values, into “80 or above,” “50 or above but below 80,” “30 or above but below 50,” and “below 30.” ... Accordingly, selecting ... persons with “50 or above but below 80 ml/min” from the patients receiving administration under the invention of Exhibit Ko 7 involves no difficulty whatsoever for a person skilled in the art.

Tokyo High Court, 2000 (Gyo-Ke) 120 [Nickel Electrode Active Material for Alkaline Storage Batteries] <Yamashita>

Original Ameblo publication: 2022-09-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12763883604.html

Tokyo High Court, 2000 (Gyo-Ke) 120 [Nickel Electrode Active Material for Alkaline Storage Batteries] <Yamashita>

* For a product invention, disclosure of a “manufacturing method” is necessary if a person skilled in the art cannot readily manufacture the product.

* The IP High Court decision in 2005 (Gyo-Ke) 10205 is to the same effect.

* The IP High Court decision in 2005 (Gyo-Ke) 10280 is to the same effect.

⇒ The description does not distinguish the manufacturing method sufficiently from those in the references.

⇒ Enablement requirement not satisfied.

(Excerpts from the judgment)

Even for a product invention, if disclosure of the product's purpose, constitution and effects alone does not enable a person skilled in the art readily to manufacture it, the “purpose, constitution and effects of the invention” cannot be said to be described “to an extent enabling a person having ordinary knowledge in the technical field to which the invention pertains readily to work it,” unless a method of manufacturing the product is also disclosed. ... Even if the description states that a product not existing in the prior art has actually been obtained and exhibits particular functions and effects, that establishes only novelty and inventive step. In addition to Article 29(1) and (2) on novelty and inventive step, Article 36(4) of the former Patent Act, as discussed above, also requires that a person skilled in the art be able readily to work the invention. The plaintiff's argument is, in essence, that a patent should be granted for something novel and inventive even if a person skilled in the art cannot work it; this misunderstands the requirements for protecting inventions under the Patent Act ....

The manufacturing method of the invention is not the same as the technologies in the publications of Exhibits Otsu 1 and 2, but insufficient disclosure leaves it indistinguishable from those technologies .... Thus, the description gives only vague operations, pH and temperature ranges, without specific guidance necessary to manufacture the powder or nickel hydroxide powder containing it. Even if a person skilled in the art attempts manufacture according to it, an unreasonably large amount of trial and error would be necessary while success remains uncertain. In such circumstances, that person cannot be said readily to be able to manufacture nickel hydroxide powder containing the powder at issue, and the description cannot be regarded as providing disclosure “to an extent enabling a person having ordinary knowledge in the technical field to which the invention pertains readily to work it” ....

IP High Court, 2021 (Gyo-Ke) 10136, 10138 [Soldering Apparatus] <Honda>

Original Ameblo publication: 2022-09-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12764056199.html

IP High Court, 2021 (Gyo-Ke) 10136, 10138 [Soldering Apparatus] <Honda>

<JPO decision>

Readily conceivable if a “solder piece designated F1” is used as the solder piece in the invention of Exhibit Ko 1.

<This judgment>

Without knowledge of the claimed invention's problem and functions and effects, there is no motivation to use a particular solder piece (F1) in the cited invention.

⇒ Inventive step affirmed (a type of selection invention).

[Claim 1] (The portion relating to “Difference 2,” held not readily conceivable)

“... A soldering apparatus configured such that said heating means is positioned to transfer heat through said nozzle to said solder piece abutting the tip of said terminal; said solder piece before melting receives that heat transfer and melts while abutting the terminal tip; the molten solder piece tends to round into an approximately spherical shape but, because it is constrained by the inner wall of said nozzle and the terminal tip, necessarily remains short of a true sphere and stops while resting on said terminal, without moving in the direction in which the solder piece was supplied; in this stopped state, heat transmitted from the nozzle to the molten solder piece is transferred from the molten solder piece to said terminal to heat it; and, after the terminal is heated by this heating, the molten solder piece flows out.”

<JPO Decision, Invalidation No. 2019-800094> (The portion finding “Difference 2” readily conceivable)

The JPO decision held that “if a solder piece with a flux content of 1.0 mass% (wt%), the standard designated F1, is used as the solder piece of the invention of Exhibit Ko 1,” it “... cannot become a true sphere,” and is therefore readily conceivable. The relevant passage is quoted below.

“Regarding ... the flux (rosin) content of the solder in the invention of Exhibit Ko 1, Exhibit Ko 15 ... states that solder contains 1–4 wt% rosin, and Exhibit Ko 10 ... states that the Japanese Industrial Standard for flux-cored solder designates as F1 a flux content of 1.0 mass%, with a permissible range of 0.5 mass% or more but less than 1.5 mass%. Considering these statements, soldering with solder having a flux content of approximately 1 wt% is recognized as something a person skilled in the art could readily have done. Accordingly, we consider the case where a solder piece having a flux content of 1.0 mass% (wt%), the standard designated F1, is used in the invention of Exhibit Ko 1. ...

By using solder designated F1 under the standard in the invention of Exhibit Ko 1, when the solder piece is heated and melts at the abutment position, it cannot become a true sphere because it is constrained by the inner wall of the through-hole at the soldering iron tip and the tip of the pin. ...”

<Extract from this judgment> (The portion finding “Difference 2” not readily conceivable)

The court rejected obviousness, holding that, because the problem of the claimed invention was not known, there was no motivation to use a particular solder piece (designated F1) in the cited invention (the invention of Exhibit Ko 1). The passage follows.

“... Invention 1 ensures that the solder piece before melting abuts both the nozzle's inner wall and the terminal tip, and that the molten solder piece necessarily remains short of a true sphere while resting on the

terminal and stops without moving downward. Heat conduction from the nozzle and other mechanisms sufficiently heat the solder piece and terminal, thereby enabling soldering at an appropriate temperature and producing the effect of preventing defective soldering. In contrast, Exhibit Ko 1 ... neither describes nor suggests that the molten solder necessarily stops without becoming a true sphere; that is, that the solder piece and terminal are sufficiently heated because the solder continues to abut the nozzle's inner wall after melting. Thus, without knowing the problem to be solved by the configuration in which the molten solder necessarily does not become a true sphere, or the functions and effects produced by that configuration, a person skilled in the art encountering Exhibit Ko 1 has no motivation deliberately to adopt solder having a flux content of 1 wt% to obtain that configuration ....”

<Some observations>

The JPO decision held that the difference would substantially disappear if a particular solder piece (designated F1) were used in the cited invention (the invention of Exhibit Ko 1). In contrast, this judgment rejected the existence of motivation to use that particular solder piece in the cited invention in the first place, and affirmed inventive step.

Generally, where multiple options exist for a component used in the cited invention, the obviousness of choosing one option is at issue as a so-called selection invention.

The JPO decision also reasoned, “Regarding ... the flux (rosin) content of the solder in the invention of Exhibit Ko 1, Exhibit Ko 15 ... states that solder contains 1–4 wt% rosin, and Exhibit Ko 10 ... states that the Japanese Industrial Standard for flux-cored solder designates as F1 a flux content of 1.0 mass%, with a permissible range of 0.5 mass% or more but less than 1.5 mass%.” In this way it sought to demonstrate what the judgment calls “motivation deliberately to adopt solder having a flux content of 1 wt%.” However, this judgment found that the JPO decision had merely presented the available options and had not fully demonstrated obviousness or motivation for focusing, among them, on “solder having a flux content of 1 wt %” (designated F1).

The JPO presumably regarded this as a mere selection from well-known technology and therefore a matter of design choice. Recent court decisions, however, tend to emphasize whether attention could have been directed to the problem of the invention. This judgment likewise resolved the issue with the wording that, “without knowing the problem ... or the functions and effects produced by that configuration, ... there is no motivation deliberately to adopt solder having a flux content of 1 wt% to obtain that configuration ....”

On this point, one might consider whether it is possible to affirm the obviousness of using “solder having a flux content of 1 wt%” (designated F1) in the invention of Exhibit Ko 1 even without necessarily knowing the problem and functions and effects of the invention at issue. Moreover, the description itself states, “[Problem to Be Solved by the Invention] [0007] In view of the above problems, this invention aims to prevent defective soldering.” If the problem is the general one of “preventing defective soldering,” it may have been possible to argue that this was known. Close examination of the judgment shows that it does not identify the invention's problem more specifically than that general problem. If the problem is identified specifically, the next question is whether, under the state of the art at filing, a person skilled in the art could recognize that the problem could be solved (the support requirement). Thus, generally, a party asserting patent invalidity might consider contesting the invention's problem, also as groundwork for arguments concerning support or addition of new matter.

I will speak at “Sugoi Chizai EXPO” (October 6–7, 2022) on “20 Selected Important Patent Decisions.”

This video is a six-minute trailer for the full 40-minute presentation.

Register for Sugoi Chizai EXPO, watch the full presentation too, and pick up some useful knowledge!!

<Contents>

1. Support requirement

2. Addition of new matter (general principles, partial priority, parent/child/grandchild applications)

3. Inventive step (the invention's problem, parameter inventions, incorporating effects into claims)

4. Prior-use rights (+ comparison with publicly worked inventions)

5. Article 104 of the Patent Act (presumption concerning a process for producing a new substance)

6. Doctrine of equivalents (third and fifth requirements; second requirement)

7. Offers to transfer (offers made abroad for transfers within Japan)

8. Filing strategies with entry into other countries in mind (approaches to drafting the priority application's description)

9. Patent infringement and directors' personal liability (Article 429(1) of the Companies Act)

10. Joint infringement

11. Patent enforcement and the Antimonopoly Act

12. Foreign servers and working an invention within Japan

13. Comparison of exhaustion doctrines in Japan and the United States

14. Summary of 12 selected approaches to claim wording

IP High Court, 2020 (Ne) 10059 [Equol-Containing Extract and Method for Producing It] <Honda>

Original Ameblo publication: 2022-09-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12764221143.html

IP High Court, 2020 (Ne) 10059 [Equol-Containing Extract and Method for Producing It] <Honda>

Appeal in an action seeking an injunction against patent infringement (a case in which the production method was presumed under Article 104 of the Patent Act. Priority was recognized, and the date of “the patent application for the patent at issue” was held to be the priority date. The patentee prevailed on reversal.)

[Summary of the Judgment and Some Observations]

1. Claims (Patent No. 6275313, claim 1)

<Before correction>

“A method for producing a fermented product containing ornithine and equol, comprising subjecting a fermentation starting material containing at least one daidzein species selected from the group consisting of daidzein glycosides, daidzein and dihydrodaidzein, and arginine, to fermentation treatment with a microorganism having ornithine-producing and equol-producing abilities.”

<After correction>

“A method for producing a powdered fermented product containing ornithine and equol, comprising adding arginine to at least one daidzein species selected from the group consisting of daidzein glycosides, daidzein and dihydrodaidzein; and

subjecting a fermentation starting material containing said daidzein species and said arginine to fermentation treatment with a microorganism having ornithine-producing and equol-producing abilities,

wherein said fermentation treatment produces at least 8 mg of ornithine and at least 1 mg of equol per 1 g dry weight of said fermented product; and

said fermented product is used as a food ingredient;

said production method.”

2. The principal issue in this litigation: Article 104 of the Patent Act

The principal issue in this case is “whether the appellees' starting material is presumed under Article 104 of the Patent Act to have been produced by the method of the corrected invention (Issue 1-1).”

Article 104 of the Patent Act provides that, where a patent has been granted for an invention of a process for producing a product, if that product was not publicly known in Japan before the patent application, an identical product is presumed to have been produced by that process.

This judgment examined each requirement of Article 104 as follows.

2-1. “Invention of a process for producing a product”

As to ① “invention of a process for producing a product,” the court held: “The patent at issue is a case in which a patent has been granted for a process for producing a product (the product of the corrected invention) that is ‘a powdered fermented product containing ornithine and equol, in which at least 8 mg of ornithine and at least 1 mg of equol are produced per 1 g dry weight of the fermented product, and which is used as a food ingredient.’”

2-2. “An identical product”

As to ② “an identical product,” the court held: “The appellees have neither admitted nor denied, and have not clarified, whether their starting material constitutes the above product of the corrected invention. They shall therefore be deemed to have admitted that their starting material constitutes that product (Article 159(1) of the Code of Civil Procedure).”

Accordingly, “if the product of the corrected invention was not publicly known in Japan before the patent application for the patent at issue, the appellees' starting material is presumed to have been produced by the method of the corrected invention.” Thus, the date of “the patent application for the patent at issue” is decisive. Specifically, the main issue became whether the corrected invention was described in the application documents of the basic application supporting the priority claim for the patent (“the basic application”), or was an invention tantamount to being described there.

2-3. Date of “the patent application for the patent at issue”: whether priority is available

As to ③ the date of “the patent application for the patent at issue,” the court held: “The corrected invention is recognized as having been described, or being tantamount to having been described, at least in Basic Applications A and B, and should be entitled to the benefit of priority based on them. Accordingly, for application of Article 104 of the Patent Act, the patent is deemed to have been applied for on June 13, 2007, its priority date. Thus, when examining whether the product of the corrected invention was ‘not publicly known’ in Japan before the patent application under that Article, Exhibit Otsu B3 (International Publication WO 2007/066655, internationally published June 14, 2007), published after the priority date, cannot be considered.”

The principal disputed issue in this case is whether the corrected invention is recognized as having been described, or being tantamount to having been described, at least in Basic Applications A and B, and whether it is entitled to the benefit of priority based on them. The original judgment examined the issue using the same framework as the appellate judgment but found that the benefit of priority was unavailable. The appellate judgment reached the opposite conclusion on this point. Details are discussed in Section 3 below.

2-4. The requirement “not publicly known”

As to ④ “not publicly known,” the court held: “For a product to be regarded as ‘publicly known’ under Article 104 of the Patent Act, at least facts must have been known at the reference date to an extent enabling a person skilled in the art to obtain a clue to its manufacture. The product of the corrected invention cannot be said to have been described in Exhibits Otsu B16 and B24, which were publicly known at the priority date, and the corrected invention cannot readily be conceived from Exhibit Otsu B16 or B24 .... Accordingly, it cannot be said that a person skilled in the art encountering either document at the priority date could have obtained a clue to manufacturing the product of the corrected invention.

“The appellees also argue that the product of the corrected invention is ‘publicly known’ because it merely adds ‘8 mg’ of ornithine of ‘97.48%’ purity, a nutritional fortification additive (International Publication WO 2006/051940, Exhibit Otsu B67), to ‘992 mg’ of the fermented product of ‘Example 1’ in Exhibit Otsu B16, in which ‘1–3 mg of equol is produced per 1 g dry weight.’ However, ... the product of the corrected invention is ‘a powdered fermented product containing ornithine and equol, in which at least 8 mg of ornithine and at least 1 mg of equol are produced per 1 g dry weight of the fermented product, and which is used as a food ingredient.’ Even combining Exhibits Otsu B16 and B67 does not yield a product ‘in which at least 8 mg of ornithine and at least 1 mg of equol have been produced per 1 g dry weight of the fermented product.’ Therefore, that argument cannot be accepted.”

Thus, according to this judgment, “publicly known product” in Article 104 is construed differently from “publicly known invention” in Article 29(1)(i) of the Patent Act. This judgment requires that “at least facts

were known at the reference date to an extent enabling a person skilled in the art to obtain a clue to manufacturing the product."

Regarding this requirement, for example, Tokyo District Court, 1970 (Wa) No. 7935 also held: "As to the meaning of 'the product ... publicly known in Japan' in Article 104 of the Patent Act, this court considers that the product need not necessarily exist in reality, but at least facts must be known to an extent enabling a person having ordinary knowledge in the technical field to obtain a clue to its manufacture." The presumption under Article 104 was recognized in that judgment.

Osaka District Court, 1997 (Wa) No. 11617 also held: "From the standpoint of whether the above likelihood exists, 'not publicly known' in that Article should be construed as meaning not merely that the product does not exist in reality, but that there are also no facts known to an extent enabling a person having ordinary knowledge in the technical field to obtain a clue to its manufacture." (The presumption under Article 104 was not recognized in that judgment.)

Tokyo High Court, 1979 (Ne) No. 825 held: "The appellee argues that Article 104 of the Patent Act cannot apply because some compounds among the target substances of the patented invention were already publicly known before its patent application. Even if there were such publicly known compounds, however, as stated above, the appellee manufactures and sells dipyridamole, dipyridamole is encompassed within the target substances of the patented invention, and that target substance was not publicly known in Japan before the patent application. Therefore, there is no impediment to applying that Article." (In that judgment, the presumption under Article 104 applied, but was rebutted because the appellee's methods did not fall within the technical scope of the patented invention.)

In the context of whether the product was "publicly known" under Article 104, this judgment stated that "at least facts must have been known at the reference date to an extent enabling a person skilled in the art to obtain a clue to its manufacture. The product of the corrected invention cannot be said to have been described in Exhibits Otsu B16 and B24, which were publicly known at the priority date, and the corrected invention cannot readily be conceived from Exhibit Otsu B16 or B24." If the judgment thereby held that a product readily conceivable from a publicly known invention constitutes a "publicly known" product under Article 104, it goes a step further than earlier decisions. Details are discussed below in the observations, but despite using the same wording as "publicly known" invention in Article 29(1)(i), the interpretation is entirely different, and its appropriateness warrants further examination.

2-5. The Article 104 presumption was not rebutted in this case

As to ⑤ the absence of rebuttal of the Article 104 presumption, the court held: "It cannot be said to have been proved that the method of the corrected invention was not used to produce the appellees' starting material; therefore, the presumption under Article 104 cannot be regarded as rebutted."

3. Date of "the patent application for the patent at issue": whether priority is available

3-1. Original judgment (Tokyo District Court, 2018 (Wa) No. 18555 <Presiding Judge Tanaka>)

The court held that "the patent application date for the patent at issue" could not go back to the priority date (in relation to the defendant's method). ⇒ Article 104 did not apply because of a product publicly known between the priority date and the parent application's filing date. (* A partial-priority approach. ⇒ Partial priority does not extend to the defendant's method.)

"With regard to application of Article 104 ..., if the 'fermented product containing ornithine and equol' was not publicly known in Japan before the patent application for the patent at issue, the defendant's starting material would be presumed to have been produced by the method of the invention. ... We examine the specific date meant by 'the patent application for the patent at issue.' ... That date could be viewed as the priority date .... However, the fermentation starting material in the method of the invention is 'at least one daidzein species selected from the group consisting of daidzein glycosides, daidzein and dihydrodaidzein,' and the description also discloses various daidzein species .... In contrast, the only fermentation starting

material disclosed in the description ... of the basic application for priority ... is ‘soybean hypocotyl,’ and no daidzein species other than soybean hypocotyl are disclosed. Accordingly, for the invention whose fermentation starting material is soybean hypocotyl, the date of ‘the patent application for the patent at issue’ is the priority date ..., whereas for the invention whose fermentation starting material is a daidzein species other than soybean hypocotyl, that date is the parent application's filing date .... The defendant's method ... uses a daidzein species other than soybean hypocotyl as the fermentation starting material. ...

“Accordingly, for the invention in respect of which this defendant's method would be subject to the production-method presumption, the date of ‘the patent application for the patent at issue’ should be the parent application's filing date ..., not the priority date .... At the parent application's filing date, the ‘fermented product containing ornithine and equol’ is recognized as having been publicly known in Japan; thus, the defendant's starting material is not presumed to have been produced by the method of the invention ....”

3-2. This appellate judgment (IP High Court, 2020 (Ne) No. 10059 <Presiding Judge Honda>)

The court held that “the patent application date for the patent at issue” could go back to the priority date (also in relation to the defendant's method). ⇒ Since products publicly known between the priority date and the parent application's filing date are not considered, Article 104 applies.

“A person skilled in the art encountering the above statements in Basic Applications A and B, considered together with common general technical knowledge at the priority date, could recognize that, even when a ‘starting material containing daidzein species’ other than ‘soybean hypocotyl’ is used as the fermentation starting material, a powdered fermented product used as a food ingredient and containing at least 8 mg of ornithine and at least 1 mg of equol per 1 g dry weight can be produced by causing the daidzein species in the fermentation starting material to be metabolized together with arginine by a microorganism capable of producing equol and ornithine, such as Lactococcus strain 20-92. Therefore, the corrected invention can be read from Basic Applications A and B. Accordingly, the corrected invention is recognized as having been described, or being tantamount to having been described, at least in Basic Applications A and B, and should be entitled to the benefit of priority based on them.

“Thus, for application of Article 104 of the Patent Act, the patent is deemed to have been applied for on the priority date .... Therefore, in examining whether the product of the corrected invention was ‘not publicly known’ in Japan before the patent application under that Article, Exhibit Otsu B3 ..., published after the priority date, cannot be considered. ... The product of the corrected invention can be regarded as ‘not publicly known’ at the priority date. ... It cannot be said to have been proved that the method of the corrected invention was not used to produce the appellees' starting material; therefore, the Article 104 presumption cannot be regarded as rebutted.”

4. Some observations

This appellate judgment is a rare case in which the production method for a new substance was presumed under Article 104 of the Patent Act and the patentee prevailed.

Among the requirements of that Article, “before the patent application” means before the priority date where priority is recognized. In this case, the fermentation starting material disclosed in the basic application's description was only “soybean hypocotyl,” with no daidzein species other than soybean hypocotyl disclosed. On those facts, the first-instance judgment adopted a partial-priority approach: only for the “invention whose fermentation starting material is soybean hypocotyl” did the “patent application” date become the priority date, while for the “invention whose fermentation starting material is a daidzein species other than soybean hypocotyl,” the date of “the patent application for the patent at issue” did not go back to the priority date. In contrast, the appellate judgment held that the problem-solving mechanism disclosed in the basic application's description applied equally whether the fermentation starting material was “soybean hypocotyl” or “a daidzein species other than soybean hypocotyl.” Thus, even for a method of

producing a fermented product using “a daidzein species other than soybean hypocotyl” as the starting material, as in the defendant's product, the date of “the patent application for the patent at issue” was the priority date, and products publicly known after that date did not constitute “publicly known products” under Article 104.

In applying “publicly known product” in Article 104, the appellate judgment held: “Since the product of the corrected invention is ‘a powdered fermented product containing ornithine and equol, in which at least 8 mg of ornithine and at least 1 mg of equol are produced per 1 g dry weight of the fermented product, and which is used as a food ingredient,’ even combining Exhibits Otsu B16 and B67 does not yield a product ‘in which at least 8 mg of ornithine and at least 1 mg of equol have been produced per 1 g dry weight of the fermented product.’” Under this reasoning, narrowing claim language by amendment or correction so that “the defendant's product just barely falls within it,” irrespective of inventive step, makes it harder for previously known products to fall within “publicly known product” under Article 104. This should be kept in mind when enforcing a patent on a process for producing a new substance. Conversely, from the defendant's perspective, the appellate judgment does not reject the very possibility of asserting as a “publicly known product” a combination of products described in two documents. In other words, even if the product is not known in a manner depriving it of novelty, “publicly known product” under Article 104 may include a product realized by combining known products as in an inventive-step analysis. In this sense, under this judgment, “publicly known product” under Article 104 can be regarded as a concept encompassing arguments akin to inventive step from both the right holder's and alleged infringer's perspectives; whether that is appropriate requires further examination.

5. <Reference> Action to revoke a JPO decision decided two months before this appellate judgment (IP High Court, 2020 (Gyo-Ke) No. 10150 <Presiding Judge Honda>)

5-1. Divisional-application requirements satisfied — Only the lower limit of “8–15 mg” in the original description was incorporated into the claim.

“[Claim 1 (after correction)] A method for producing ... at least 8 mg of ornithine and at least 1 mg of equol per 1 g dry weight of the fermented product ....

“... Paragraph [0050] of the original description states: ‘Specific examples of the ornithine content in an equol-containing fermented soybean-hypocotyl product include approximately 5–20 mg, preferably 8–15 mg and more preferably 9–12 mg, of ornithine per 1 g dry weight of the equol-containing fermented soybean-hypocotyl product.’ Thus, it states a preference for 8–15 mg of ornithine per 1 g dry weight of the fermented product, and configuration ③ above can be said to be specified by the lower limit of the ‘8–15 mg’ exemplified in the original description.”

5-2. Novelty affirmed

“... The plaintiff's argument is premised on conversion from arginine to ornithine far exceeding 100% (approximately 159%) in [Table 3] of the description, but ... the fermentation starting materials and conditions differ. The dry weight of a fermented product may vary greatly according to the solid content of the starting material and medium, so changing the starting material also changes the amount of ornithine per 1 g dry weight. Thus, ornithine production per 1 g dry weight may vary greatly between use of a soybean-hypocotyl solution and use of soy milk as the starting material. Different culture conditions may also produce different conversion rates from arginine to ornithine. Accordingly, [Table 3] of the description cannot appropriately be used as the premise for estimating ornithine production in the test examples of Exhibit Ko 1. ... Since those examples do not specify the composition of the BHI broth used as the medium, the invention of Exhibit Ko 1 does not necessarily produce at least 8 mg of ornithine per 1 g dry weight of the fermented product .... Accordingly, that invention cannot be regarded as ‘producing at least 8 mg of ornithine per 1 g dry weight of the fermented product.’”

5-3. Inventive step affirmed — Applying well-known technology also requires motivation for combination and other considerations

“When determining whether the claimed invention could readily have been made by applying a secondary cited invention to a primary cited invention, it is appropriate ① to assess whether motivation exists to apply the secondary invention to the primary invention and reach the claimed invention, taking comprehensively into account suggestions in either cited invention, the relationship between their technical fields, commonality of problems, functions and operations, and other factors, and ② to consider together whether factors impede the application and whether unpredictable, remarkable effects exist (see IP High Court judgment of April 13, 2018 [2016 (Gyo-Ke) Nos. 10182 and 10184]). The same applies when determining whether the claimed invention could readily have been made by applying well-known technology to a cited invention.”

https://www.nakapat.gr.jp/ja/legal_updates_jp/%e3%80%90%e7%89%b9%e8%a8%b1%e2%98%85%e3%80%91%e7%89%b9%e8%a8%b1%e6%a8%a9%e4%be%b5%e5%ae%b3%e5%b7%ae%e6%ad%a2%e8%ab%8b%e6%b1%82%e6%8e%a7%e8%a8%b4%e4%ba%8b%e4%bb%b6%ef%bc%88%e7%89%b9%e8%a8%b1%e6%b3%9510/

<Article> A Study of Judicial Determinations on Priority (Intellectual Property Management, Vol. 72, No. 4, 2022)

Original Ameblo publication: 2022-09-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12764402671.html

<Article> A Study of Judicial Determinations on Priority (Intellectual Property Management, Vol. 72, No. 4, 2022)

Since the Artificial Nipple case, there have been six court decisions disputing priority in cases involving added embodiments or partial deletion of defining features, and priority was affirmed in all six!!

Was the Artificial Nipple case unusually strict ...?

The article also explains decisions in other categories.

https://pbs.twimg.com/media/EyWxEH_UcAMF6hH?format=jpg&name=large

* In the Artificial Nipple case, another company filed an application for a spiral shape between the first application and the priority-claiming application. If priority were recognized, that company's working would constitute patent infringement. The patentee had secured rights to nonspiral shapes through a divisional application, then refused to delete the added spiral-shaped embodiment in an effort to maximize the scope of its rights.

Trade Secrets (Keeping Information Confidential) — Choosing a Strategy for Protecting Corporate Technical Information

Original Ameblo publication: 2022-09-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12764473407.html

We have posted the article “Trade Secrets (Keeping Information Confidential) — Choosing a Strategy for Protecting Corporate Technical Information” on the NAKAMURA & PARTNERS website.

① Technical value and nature

② Economic value

③ Differences in legislation and practical operation among the relevant countries

④ Consistency with the company's business strategy for the relevant products and services

Determine the strategy accordingly.

IP High Court, 2008 (Gyo-Ke) 10196 [Die-Bonding Material and Bonding Method] <Nakano>

Original Ameblo publication: 2022-09-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12764566225.html

IP High Court, 2008 (Gyo-Ke) 10196 [Die-Bonding Material and Bonding Method] <Nakano>

* In identifying the gist of the invention, “synthesized from ... and ...” was construed to mean “only,” i.e., a closed form. ⇒ Inventive step affirmed.

⇒ The description contained working and comparative examples comparing and distinguishing characteristics on the premise of compositional differences from other monomers.

(Excerpts from the judgment)

... It is clear that Inventions 1–12 do not have as a defining element that “the peel strength at the stage when the semiconductor element is bonded to the support member using the die-bonding material is at least 0.5 kgf/5 mm × 5 mm chip” (...). Accordingly, enablement of the “invention” is not at issue with respect to the matter identified by the JPO decision, and the decision's above determination is erroneous in its premise ....

The defendant argues, based on statements in the plaintiff's written answer in the trial proceedings, which were based on the description before correction, that “a peel strength of at least 0.5 kgf/5 mm × 5 mm chip” is one of the substantive defining elements of the invention. However, that answer was premised on the claims before correction, and, regardless of what it says, it does not newly add a defining feature absent from the claims. Therefore, the defendant's argument cannot be accepted.

IP High Court, 2019 (Gyo-Ke) 10142 [Roll Product Package] <Mori>

Original Ameblo publication: 2022-09-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12765254603.html

IP High Court, 2019 (Gyo-Ke) 10142 [Roll Product Package] <Mori>

“The portion on which a consumer hooks a finger is highly likely to tear ...; it is unreasonable to say that making the film in such a highly tear-prone portion resistant to tearing is not a problem addressed.”

* The invention's problem was identified specifically!!

Support requirement not satisfied.

(Excerpts from the judgment)

... Solving the problem that “the film is resistant to tearing” by placing the film and roll products within the invention's numerical limitations is indispensable to the invention. If this is not recognized as within the scope in which a person skilled in the art can recognize that the problem can be solved based on the detailed description and common general technical knowledge, the support requirement is violated ....

The plaintiff argues that the invention does not aim to prevent tearing outside the packaging bag, such as breakage of the handle. However, ... when a consumer carries a gusseted package, the portion of the finger hole in the handle on which the consumer hooks a finger is highly likely to tear. It is therefore unreasonable to say that making the film in such a highly tear-prone portion resistant to tearing is not a problem addressed by the invention. ...

Even if the sensory evaluation establishes that the film at the joined portion of the roll product package resists tearing when carried by the handle, it does not establish that the film at the contact portion also resists tearing when a caramel-wrapped package without a handle is carried using the plaintiff's gripping method ....

Tokyo High Court, 2001 (Ne) 959 [Substituted Purines (Acyclovir)] <Yamashita>

Original Ameblo publication: 2022-09-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12765255180.html

Tokyo High Court, 2001 (Ne) 959 [Substituted Purines (Acyclovir)] <Yamashita>

The above acts of extracting acyclovir from the plaintiff's formulation, purifying it and recrystallizing it.

⇒ Insofar as they are regarded as merely using, transferring or otherwise dealing with acyclovir while preserving its identity, exhaustion applies.

⇒ They cannot be characterized as “production.”

— No infringement.

(Excerpts from the judgment)

... Insofar as the above acts of extracting acyclovir from the plaintiff's formulation, purifying it and recrystallizing it are regarded as merely using, transferring or otherwise dealing with the acyclovir contained in the plaintiff's formulation sold by Appellant Glaxo while preserving its identity, the effect of the patent right ... has ceased through exhaustion and does not extend to those acts. It extends only ... to cases evaluated as production of acyclovir, the subject of working the patented invention .... Because the acts should be regarded as mere use, they cannot be considered new acts of production insofar as they are viewed from the standpoint of the subject of working the patented invention ....

[Liquid-Crystal Composition]

Claim wording “consisting of ...” ⇒ Ordinarily used to exclude other third components.

The detailed description explains that components other than those incorporated into the claims are undesirable.

⇒ Claim element not satisfied.

(Excerpts from the judgment)

... The wording “consisting of A and B” is ordinarily used to exclude third components other than A and B. Thus, absent special circumstances, such as an express statement in the claims or detailed description that third components other than A and B are added, that wording cannot be construed, like “using A and B,” as not excluding third components. ... Moreover, the detailed description says nothing about additionally mixing an achiral agent other than those represented by general formula (I), and states: “Compounds having a –CN group or a carboxylic-acid ester structure as a functional group are unsuitable as the achiral component of this invention from the standpoint of maintaining a high voltage-holding ratio in the resulting liquid-crystal element. Similarly, chiral compounds having functional groups such as CN or ester groups are generally undesirable as the chiral component of this invention because of their high adsorptivity and also from the standpoint of voltage-holding ratio”; ... and “Table 3 shows that the compound of formula (X) [court's note: a chiral-agent compound], although an ester compound, has a significantly greater molecular weight than the components of Mixture A and approximately the same adsorptivity as fluorinated compounds, and is therefore preferably used as a component of the composition of this invention.” ... These statements preclude construing the “liquid-crystal composition” in Constituent Element D of the patented invention as including, besides the achiral compound represented by general formula (I), a compound containing an ester group (–COO–) as a third component.

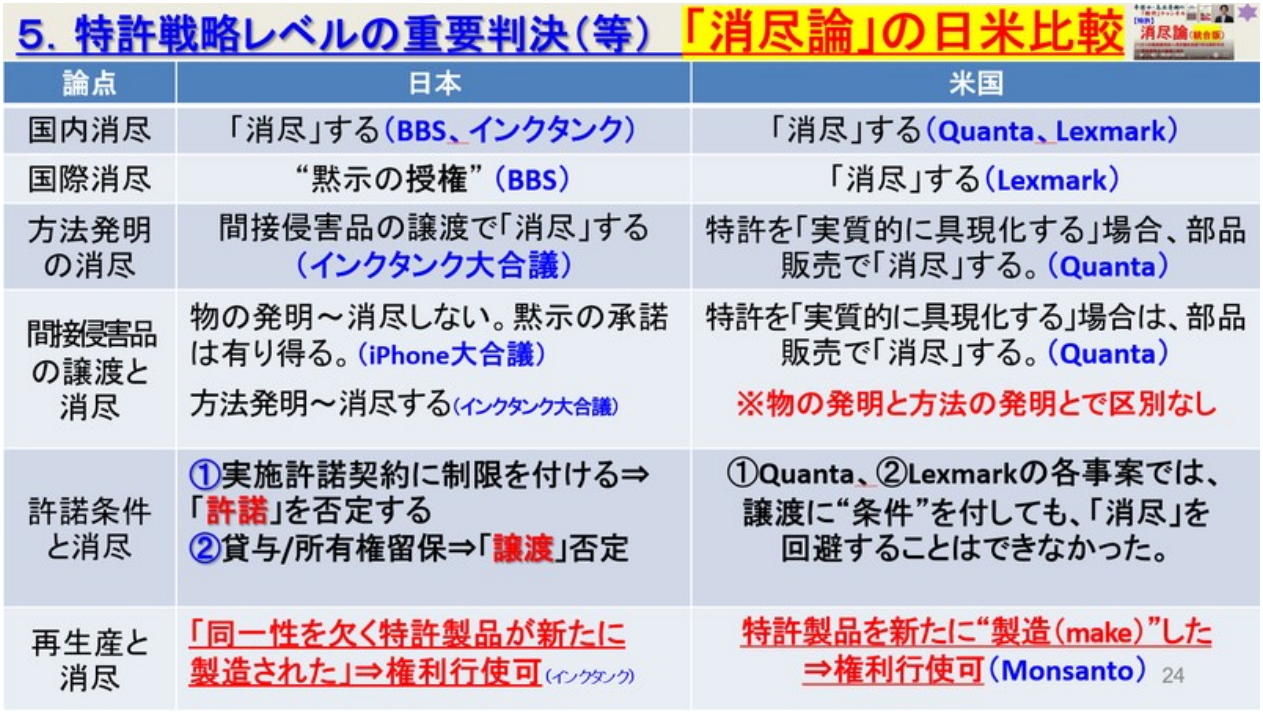
[YouTube Shorts] [Patent] Comparison of Exhaustion Doctrines in Japan and the United States

Original Ameblo publication: 2022-09-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12765257178.html

[YouTube Shorts] [Patent] Comparison of Exhaustion Doctrines in Japan and the United States



International exhaustion: opposite outcomes on whether exhaustion applies.

(Japan uses an implied-authorization approach.)

Transfer of indirectly infringing products: opposite outcomes on whether exhaustion applies.

(In Japan, product inventions are not exhausted [iPhone Grand Panel judgment]. Method inventions are exhausted if the Ink Tank Grand Panel judgment remains applicable.)

https://youtu.be/uwMtinDHKrE

5. 特許戦略レベルの重要判決(等) 「消尽論」の日米比較

論点	日本	米国
国内消尽	「消尽」する(BBS、インクタンク)	「消尽」する(Quanta、Lexmark)
国際消尽	“黙示の授権”(BBS)	「消尽」する(Lexmark)
方法発明の消尽	間接侵害品の譲渡で「消尽」する(インクタンク大合議)	特許を「実質的に具現化する」場合、部品販売で「消尽」する。(Quanta)
間接侵害品の譲渡と消尽	物の発明～消尽しない。黙示の承諾は有り得る。(iPhone大合議) 方法発明～消尽する(インクタンク大合議)	特許を「実質的に具現化する」場合は、部品販売で「消尽」する。(Quanta) ※物の発明と方法の発明とで区別なし
許諾条件と消尽	①実施許諾契約に制限を付ける⇒「許諾」を否定する ②貸与/所有権留保⇒「譲渡」否定	①Quanta、②Lexmarkの各事案では、譲渡に“条件”を付しても、「消尽」を回避することはできなかった。
再生産と消尽	「同一性を欠く特許製品が新たに製造された」⇒権利行使可(インクタンク)	特許製品を新たに“製造(make)”した⇒権利行使可(Monsanto) 24

English translation of the figure

5. Important judgments and other matters at the patent-strategy level: Japan–US comparison of the doctrine of exhaustion.

Issue	Japan	United States
Domestic exhaustion	Exhaustion occurs (BBS; Ink Cartridge).	Exhaustion occurs (Quanta; Lexmark).
International exhaustion	“Implied authorization” (BBS).	Exhaustion occurs (Lexmark).

Issue	Japan	United States
Exhaustion of method inventions	Exhaustion occurs through transfer of products constituting indirect infringement (Ink Cartridge, Grand Panel).	Exhaustion occurs upon sale of components if they “substantially embody” the patent (Quanta).
Transfer of products constituting indirect infringement and exhaustion	Product inventions: no exhaustion; implied consent may exist (iPhone, Grand Panel). Method inventions: exhaustion (Ink Cartridge, Grand Panel).	Exhaustion occurs upon component sales if they “substantially embody” the patent (Quanta). No distinction between product inventions and method inventions.
License conditions and exhaustion	(1) Restrictions in a license agreement ⇒ deny “authorization.” (2) Lease/retention of title ⇒ deny “transfer.”	In Quanta and Lexmark, “conditions” imposed on transfer could not prevent exhaustion.
Reproduction and exhaustion	“A patented product lacking identity was newly manufactured” ⇒ patent enforcement permitted (Ink Cartridge).	A patented product was newly “made” ⇒ patent enforcement permitted (Monsanto).

Slide 24.

[YouTube Shorts] [Patent] The “Resolution” of an Invention

Original Ameblo publication: 2022-09-20

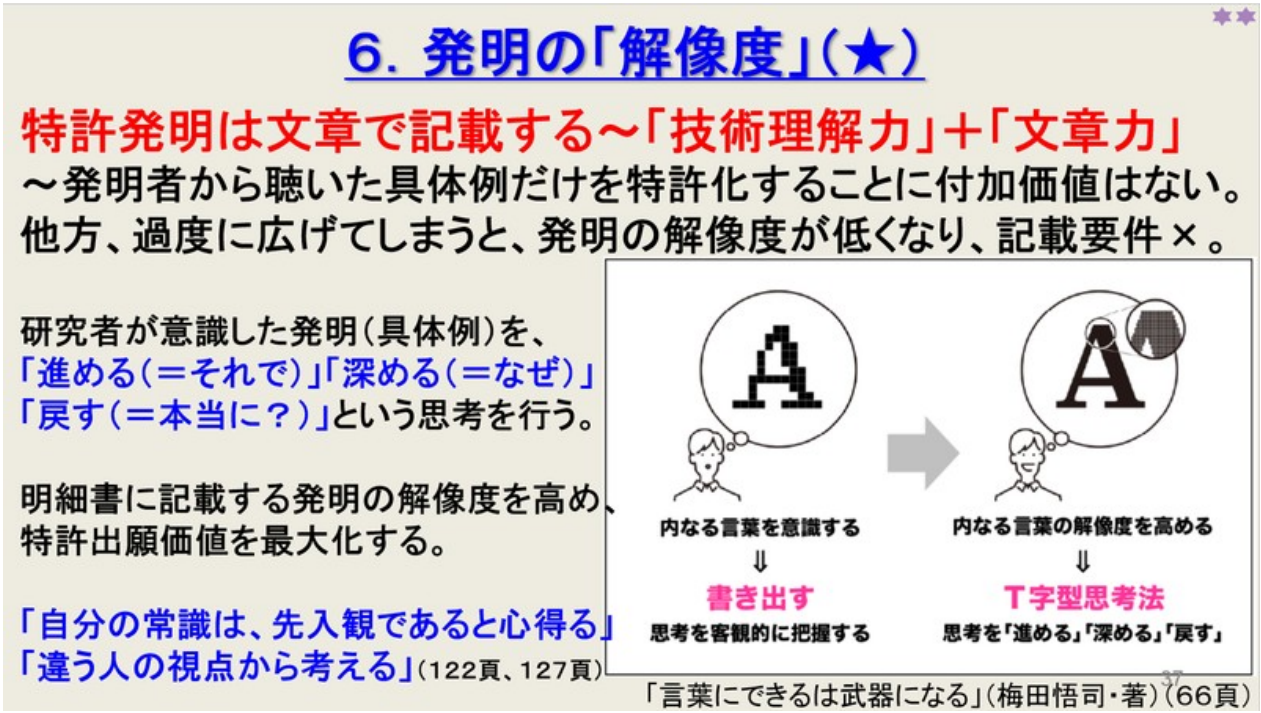
Ameblo: https://ameblo.jp/hideki-takaishi/entry-12765257595.html

[YouTube Shorts] [Patent] The “Resolution” of an Invention

Invention: “technical comprehension” + “writing ability.”

— There is no added value in patenting a specific example.

On the other hand, excessive broadening lowers the invention's resolution and fails the disclosure requirements.



“Move forward (= so what?)”

“Go deeper (= why?)”

“Step back (= really?)”

Repeat this thought process!!

https://www.youtube.com/shorts/5q1T6n04tdw

English translation of the figure

6. The “resolution” of an invention (★). A patented invention is described in words — “technical understanding” + “writing ability.”

There is no added value in patenting only the specific example heard from the inventor. On the other hand, if it is broadened excessively, the resolution of the invention decreases and the description requirements are not satisfied.

For the invention (specific example) of which the researcher is conscious, carry out the thinking processes “advance (= and then?),” “deepen (= why?)” and “go back (= really?).” Increase the resolution of the invention described in the specification and maximize the value of the patent application.

“Recognize that your common sense is a preconception.” “Think from the viewpoint of a different person.” (Pages 122 and 127.)

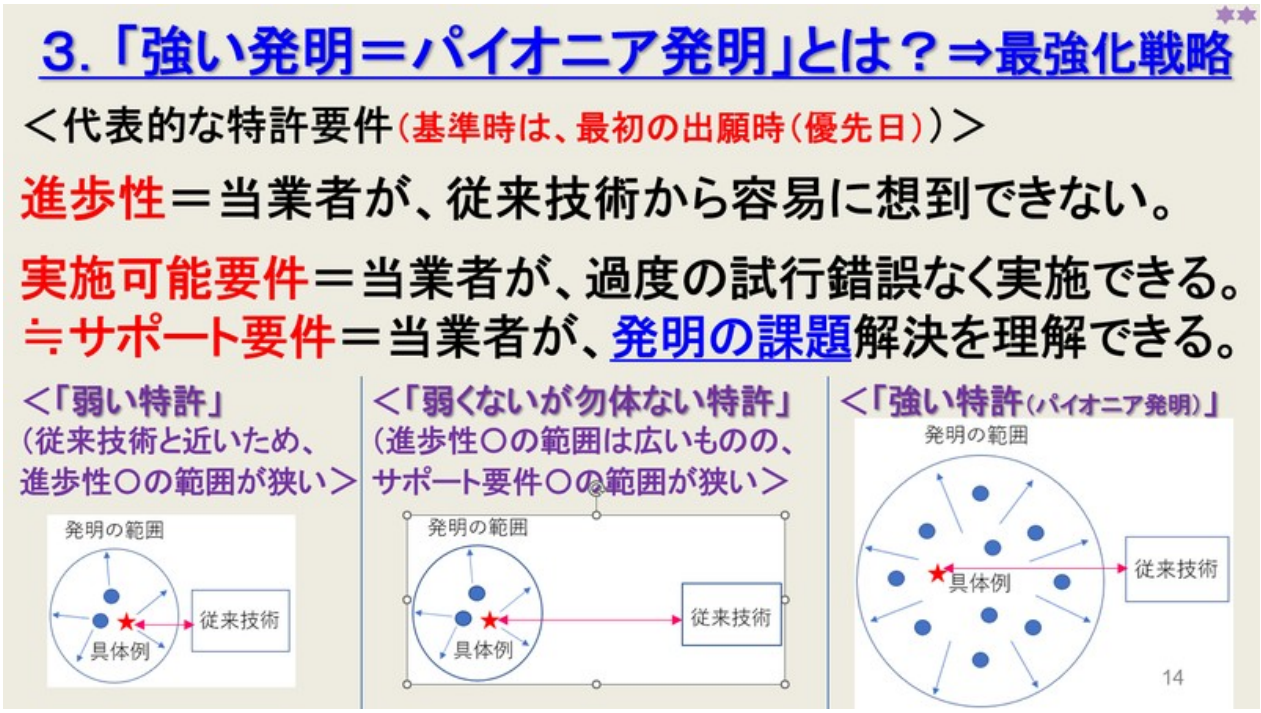
Diagram, left: Be conscious of the words within you → Write them out → Grasp your thoughts objectively.
Diagram, right: Increase the resolution of the words within you → T-shaped thinking → “Advance,” “deepen” and “go back” in your thinking.

“Being Able to Put It into Words Becomes a Weapon” (by Satoshi Umeda), page 66. Slide 37.

[YouTube Shorts] [Patent] What Is a Pioneer Invention?

Original Ameblo publication: 2022-09-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12765309770.html



[YouTube Shorts] [Patent] What Is a Pioneer Invention?

Support requirement = a person skilled in the art can understand how the invention solves its problem.

A “patent with wasted potential”: a broad scope satisfies inventive step, but only a narrow scope satisfies support.

A “strong patent (pioneer invention)”: both the scope satisfying inventive step and the scope satisfying support are broad.

(1) [Patent] What Is a Pioneer Invention? #shorts - YouTube

English translation of the figure

3. What is a “strong invention = pioneer invention”? ⇒ Strategy for making it strongest.

Representative patentability requirements (reference time: the first filing date (priority date)). Inventive step: a person skilled in the art cannot easily conceive it from the prior art. Enablement requirement: a person skilled in the art can work it without excessive trial and error. Approximately equal to the support requirement: a person skilled in the art can understand the solution of the problem of the invention.

Left: “Weak patent” — because it is close to the prior art, the range in which inventive step is satisfied is narrow. Center: “Patent that is not weak but is unsatisfactory” — although the range in which inventive step is satisfied is broad, the range in which the support requirement is satisfied is narrow. Right: “Strong patent (pioneer invention).”

Labels in each diagram: scope of the invention; specific example; prior art. Slide 14.

Tokyo District Court, 2020 (Wa) 22071 [Liquid Cleansing Agent for Removing Keratin Plugs] <Kokubu>

Original Ameblo publication: 2022-09-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12765426895.html

2020 (Wa) 22071 [Liquid Cleansing Agent for Removing Keratin Plugs] <Kokubu>

* The invention's problem was narrowly construed.

— The problem section is interpreted in light of solving the problems of the prior art.

<Problem of the invention>

Incorrect: merely being able to extract proteins.

Correct: being able to extract proteins even with a very small amount of surfactant.

⇒ Support requirement not satisfied.

(Excerpts from the judgment)

... Paragraph [0006] merely states the invention's purpose as “providing a liquid cosmetic capable of extracting proteins,” without referring to the presence or amount of surfactant, or its effect on protein extraction. However, [0006], together with [0005], is positioned in the description as discussing the “Problem to Be Solved by the Invention,” and [0005] states: “Since surfactants may burden the skin and cause roughness or similar problems, there has been demand for a method using no surfactant or only an extremely small amount.” Accordingly, it is reasonable to interpret the purpose in [0006] as premised on solving the prior-art problem stated in [0005]. ...

The problem of the invention cannot be construed merely as providing a liquid cosmetic capable of extracting proteins; it is to provide a liquid cosmetic capable of extracting proteins even without surfactant or with only a very small amount ....

Tokyo High Court, 2002 (Gyo-Ke) 58 “Sewing Machine” (Yamashita)

Original Ameblo publication: 2022-09-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12765606867.html

Tokyo High Court, 2002 (Gyo-Ke) 58 “Sewing Machine” (Yamashita)

The fact that the claimed invention and the reference address different problems is not itself a difference, but may affect inventive step!!

“Different purposes for providing a component common to both inventions may lead to a finding that the configuration relating to a difference is not readily conceivable, but ... the difference in those purposes ... does not constitute a difference between the inventions.”

It is said that inventive-step assessments were strict fifteen years ago, and that many judgments allowed combination where the primary and secondary cited inventions shared a problem, even if the claimed invention and cited invention addressed different problems .... Yet, as in the Sewing Machine judgment, the general principle stated was that “it is possible to find that the configuration relating to the difference is not readily conceivable”!!

(Excerpts from the judgment)

Points of identity and difference between the claimed invention and Cited Invention 1 should be identified by focusing on whether Cited Invention 1 has the configurations of the claimed invention, not on the purposes for providing those configurations. For example, if all configurations are identical, the two should be regarded as the same invention even if the purposes for providing some configurations differ. Where there is a structural difference between inventions, different purposes for providing a configuration common to both may lead to a finding that the configuration relating to the difference is not readily conceivable. Even then, however, the difference in purpose does not constitute a difference between the inventions.

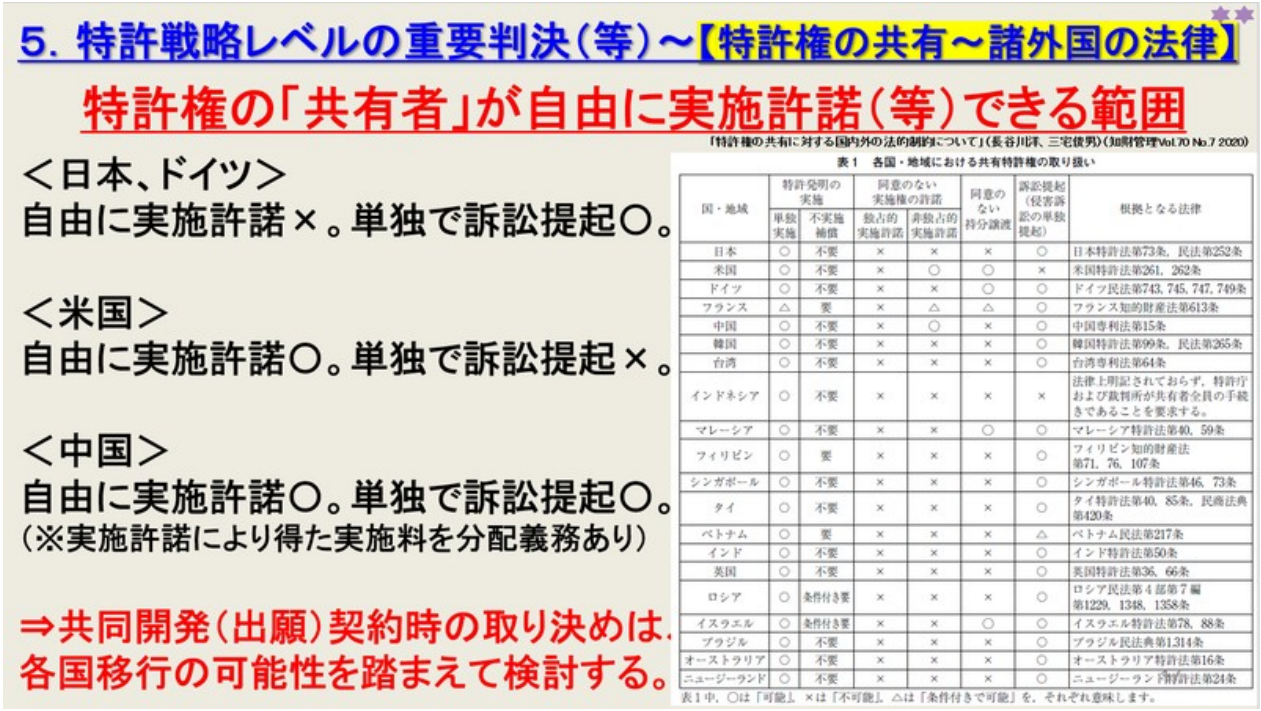
[YouTube Shorts] The Extent to Which a Patent “Co-Owner” May Freely Grant Licenses and Take Similar Actions

Original Ameblo publication: 2022-09-23

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12765827100.html

[YouTube Shorts] Patents That Management Should Know About



The extent to which a patent “co-owner” may freely grant licenses and take similar actions

<Japan, Germany> Free licensing: no. Bringing suit alone: yes.

<United States> Free licensing: yes. Bringing suit alone: no.

<China> In the absence of a different agreement among the co-owners, a co-owner may independently grant a non-exclusive license. Royalties received must be distributed among the co-owners. Bringing suit alone: yes.

[Patent] CGC Revision and Intellectual Property #shorts - YouTube

English translation of the figure

5. Important judgments and other matters at the patent-strategy level — co-ownership of patent rights: laws of various countries. The extent to which a patent “co-owner” can freely grant licenses and take similar actions.

Japan and Germany: freely granting licenses — no; filing suit alone — yes. United States: freely granting licenses — yes; filing suit alone — no. China: freely granting licenses — yes; filing suit alone — yes. (There is an obligation to distribute royalties obtained through licensing.)

Arrangements in joint development (application) agreements should be considered with the possibility of proceeding in each country in mind.

Table 1. Treatment of co-owned patent rights in various countries and regions. “○” means possible; “×” means not possible; “△” means conditionally possible. Column abbreviations below: Working = independent working of the patented invention; Compensation = compensation for non-working;

Exclusive / Non-exclusive = granting that type of license without consent; Share = transfer of a share without consent; Suit = bringing an infringement action alone.

Country/region	Working	Compensation	Exclusive	Non-exclusive	Share	Suit
Japan	○	Unnecessary	×	×	×	○
United States	○	Unnecessary	×	○	○	×
Germany	○	Unnecessary	×	×	○	○
France	△	Required	×	△	△	○
China	○	Unnecessary	×	○	×	○
South Korea	○	Unnecessary	×	×	×	○
Taiwan	○	Unnecessary	×	×	×	○
Indonesia	○	Unnecessary	×	×	×	×
Malaysia	○	Unnecessary	×	×	○	○
Philippines	○	Required	×	×	×	○
Singapore	○	Unnecessary	×	×	○	○
Thailand	○	Unnecessary	×	×	×	○
Vietnam	○	Required	×	×	×	△
India	○	Unnecessary	×	×	×	○
United Kingdom	○	Unnecessary	×	×	○	○
Russia	○	Conditionally required	×	×	×	○
Israel	○	Conditionally required	×	×	○	○
Brazil	○	Unnecessary	×	×	×	○
Australia	○	Unnecessary	×	×	○	○
New Zealand	○	Unnecessary	×	×	○	○

Legal provisions shown in the original table: Japan — Patent Act Article 73; Civil Code Article 252. United States — Patent Act Sections 261 and 262. Germany — Civil Code Sections 743, 745, 747 and 749. France — Intellectual Property Code Article 613. China — Patent Law Article 15. South Korea — Patent Act Article 99; Civil Act Article 265. Taiwan — Patent Act Article 64. Indonesia — not expressly provided in legislation; the patent office and courts require all co-owners to participate in proceedings. Malaysia — Patents Act Sections 40 and 59. Philippines — Intellectual Property Code Sections 71, 76 and 107.

Singapore — Patents Act Sections 46 and 73. Thailand — Patent Act Sections 40 and 85; Civil Code Article 420. Vietnam — Civil Code Article 217. India — Patents Act Section 50. United Kingdom — Patents Act Sections 36 and 66. Russia — Civil Code Part IV, Division VII, Articles 1229, 1348 and 1358. Israel — Patents Law Sections 78 and 88. Brazil — Civil Code Article 1,314. Australia — Patents Act Section 16. New Zealand — Patents Act Section 24.

For China, in the absence of a different agreement among the co-owners, a co-owner may independently grant a non-exclusive license. Royalties received must be distributed among the co-owners.

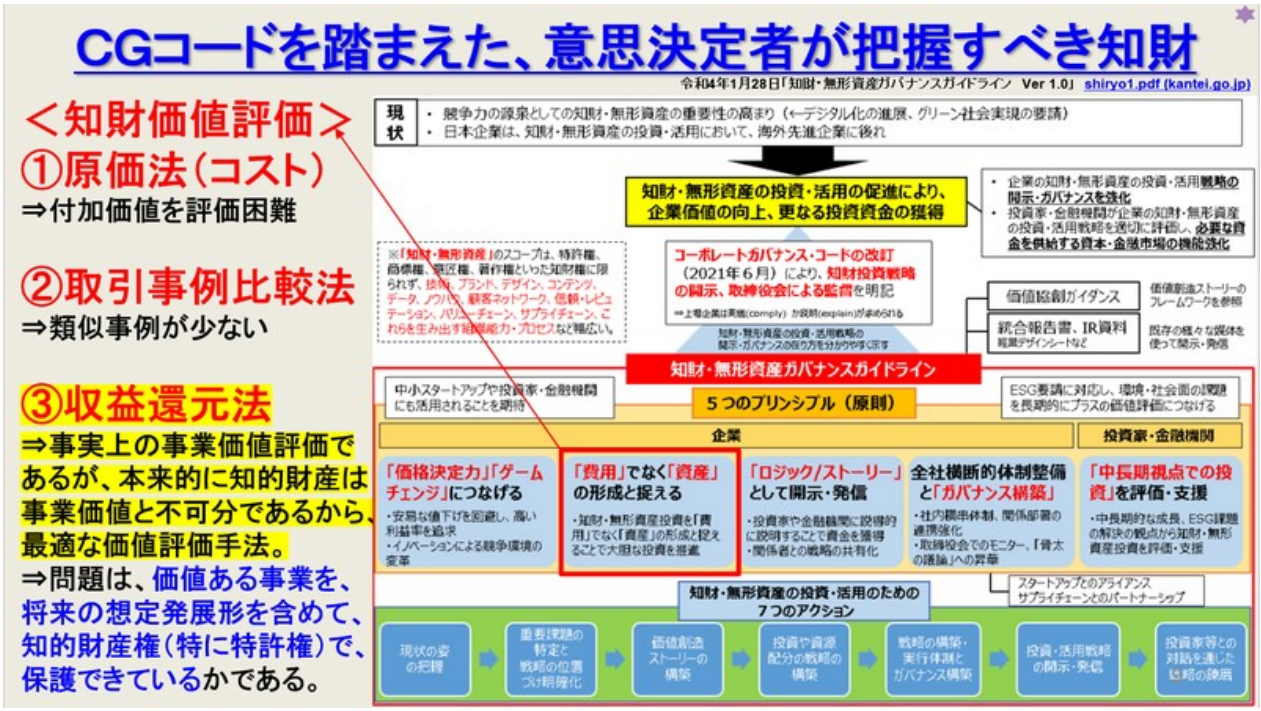
[YouTube Shorts] CGC (Corporate Governance Code) Revision and Intellectual Property

Original Ameblo publication: 2022-09-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12766436484.html



[YouTube Shorts] CGC (Corporate Governance Code) Revision and Intellectual Property

Regard intellectual property as an “asset,” not a “cost”!!

Intangible assets account for a majority of U.S. companies' enterprise value.

Accumulating in Japanese companies intellectual property and intangible assets that drive increases in enterprise value.

Mutual understanding between corporate management and investors.

English translation of the figure

Intellectual property that decision-makers should understand in light of the Corporate Governance Code.

Intellectual property valuation: (1) Cost approach — added value is difficult to evaluate. (2) Comparable-transaction approach — there are few similar cases. (3) Income approach — in substance it evaluates business value; however, because intellectual property is inherently inseparable from business value, it is the optimal valuation method. The question is whether the valuable business, including its anticipated future forms of development, is protected by intellectual property rights (particularly patents).

Current situation: The importance of intellectual property and intangible assets as sources of competitiveness is increasing, driven by progress in digitalization and calls to realize a green society. Japanese companies lag behind leading overseas companies in investment in and use of intellectual property and intangible assets.

Promoting investment in and use of intellectual property and intangible assets → increasing corporate value and obtaining further investment funds.

Strengthen disclosure and governance of companies' strategies for investing in and using intellectual property and intangible assets. Strengthen the functions of capital and financial markets so that investors and financial institutions appropriately evaluate those strategies and provide the necessary funds.

The scope of "intellectual property and intangible assets" is broad: it is not limited to intellectual property rights such as patents, trademarks, design rights and copyright, but also includes technology, brands, designs, content, data, know-how, customer networks, trust and reputation, value chains, supply chains, and the organizational capabilities and processes that create these.

Revision of the Corporate Governance Code (June 2021) expressly requires disclosure of intellectual property investment strategies and supervision by boards of directors. Listed companies are required to comply or explain.

Guidelines on Governance of Intellectual Property and Intangible Assets: clearly show how disclosure and governance should operate for investment in and use of intellectual property and intangible assets. Guidance for Collaborative Value Creation: consult the value-creation-story framework. Integrated reports, investor-relations materials, management-design sheets and other existing media: use various media for disclosure and communication.

Five principles. Companies: (1) Connect investment and use to "pricing power" and "game changing": avoid easy price reductions and pursue high profit margins; transform the competitive environment through innovation. (2) Treat them as formation of "assets," rather than "costs": promote bold investment by treating investment in intellectual property and intangible assets as asset formation. (3) Disclose and communicate as "logic/stories": obtain funds by explaining persuasively to investors and financial institutions; share strategies among stakeholders. (4) Establish cross-company structures and "governance": strengthen cooperation among internal horizontal structures and related departments; have the board monitor, raising the discussion to an "outside" perspective. Investors and financial institutions: (5) Evaluate and support "investment from a medium- to long-term perspective": evaluate and support intellectual property and intangible-asset investment from the standpoint of medium- and long-term growth and resolution of ESG issues.

The guidelines are expected to be used by small and medium-sized enterprises, startups, investors and financial institutions as well. Respond to ESG demands and connect environmental and social issues to positive value creation over the long term. Alliances with startups; partnerships with supply chains.

Seven actions for investment in and use of intellectual property and intangible assets: grasp the current situation → identify important issues and clarify the positioning of the strategy → build a value-creation story → build a strategy for allocating investment and resources → build the strategy, implementation structure and governance → disclose and communicate the investment/use strategy → refine it through dialogue with investors and others.

January 28, 2022, Guidelines on Governance of Intellectual Property and Intangible Assets, Version 1.0. shiryo1.pdf (kantei.go.jp).

IP High Court, 2021 (Gyo-Ke) 10037 [Display Device Supportable with One Hand] <Kanno>

Original Ameblo publication: 2022-09-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12766437447.html

IP High Court, 2021 (Gyo-Ke) 10037 [Display Device Supportable with One Hand] <Kanno>

* No basis for narrowly construing the corrected claim.

"There is no basis for narrowly interpreting 'any angle' as meaning an angle within the range from approximately 120 to approximately 170 degrees ...; according to its ordinary meaning, it includes the range from 0 to 360 degrees."

⇒ Correction not permitted.

(Excerpts from the judgment)

... It is clear that the intermediate left-right spread fixing means in configuration e, which "fixes" the two display panels "by a stopper" at an angle between approximately 120 and approximately 170 degrees, is a means of "temporary fixing," while the arbitrary-angle holding means in configuration C, which "holds" the two panels "by frictional force," is a means of "semi-fixing." They are naturally understood as separate means using different fixing mechanisms. ... There is therefore no basis for narrowly interpreting "any angle" in the arbitrary-angle holding means as meaning an angle between approximately 120 and approximately 170 degrees; ... according to its ordinary meaning, it should be understood as including the range from 0 to 360 degrees. ... Such a configuration is not described in the description before correction. ...

[YouTube Shorts] Doctrine of Equivalents (Summary, 2022 Edition)

Original Ameblo publication: 2022-09-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12766437620.html

[YouTube Shorts] Doctrine of Equivalents (Summary, 2022 Edition)

Established in approximately 10% of cases in which equivalence was asserted.

Mostly mechanical cases, but chemical cases include “Maxacalcitol” and “L-Glutamic Acid.”

“L-Glutamic Acid”: the key is whether “it would readily have been possible to describe it in the claims in a form satisfying the support requirement and other disclosure requirements”!

https://www.youtube.com/shorts/qhRWFayidrI

IP High Court, 2020 (Gyo-Ke) No. 10150 [Equol-Containing Fermented Soybean-Hypocotyl Product] <Honda>

Original Ameblo publication: 2022-09-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12766437786.html

IP High Court, 2020 (Gyo-Ke) No. 10150 [Equol-Containing Fermented Soybean-Hypocotyl Product] <Honda>

⇒ No violation of the requirements under the delegated ministerial ordinance.

Article 24-2 of the Regulations under the Patent Act concerns “the content of the detailed description of the invention” ...; matters necessary to understand the invention's technical significance need not be stated under the heading “Problem to Be Solved by the Invention.”

[Claim 1 (after correction)] A production method ... producing at least 8 mg of ornithine and at least 1 mg of equol per 1 g dry weight of the fermented product ....

(Excerpts from the judgment)

... The plaintiff's argument is premised on conversion from arginine to ornithine far exceeding 100% (approximately 159%) in [Table 3] of the description, but ... the fermentation starting materials and conditions differ. The dry weight of a fermented product may vary greatly according to the solid content of the starting material and medium, so changing the starting material also changes the amount of ornithine per 1 g dry weight. Thus, ornithine production per 1 g dry weight may vary greatly between use of a soybean-hypocotyl solution and use of soy milk as the starting material. Different culture conditions may also produce different conversion rates from arginine to ornithine. Accordingly, [Table 3] of the description cannot appropriately be used as the premise for estimating ornithine production in the test examples of Exhibit Ko 1. ... Since those examples do not specify the composition of the BHI broth used as the medium, the invention of Exhibit Ko 1 does not necessarily produce at least 8 mg of ornithine per 1 g dry weight of the fermented product .... Accordingly, that invention cannot be regarded as “producing at least 8 mg of ornithine per 1 g dry weight of the fermented product.”

[Foreign-server issue] IP High Court, 2018 (Ne) 10077 (Dwango v. FC2, INC.) <Presiding Judge Honda>

Original Ameblo publication: 2022-09-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12766606829.html

[Foreign-server issue] IP High Court, 2018 (Ne) 10077 (Dwango v. FC2, INC.) <Presiding Judge Honda>

Reversed on appeal: claim limitations found satisfied

＋

The court held that, for the defendant (US-based FC2), which distributed a “program for displaying comments on videos” from servers outside Japan to viewers in Japan, “viewed substantively and as a whole, the distribution is assessed as having taken place in Japan.”

Facts identified by the court in finding that FC2's distribution of the program took place in Japan.

① It begins and ends through access by users in Japan, and it is difficult to distinguish the portions within and outside Japan.

② It is controlled by users in Japan.

③ It is directed toward users in Japan.

④ The resulting effects arise in Japan.

(Excerpts from the judgment)

…If, for patent infringement to be established for inventions capable of transmission over a network, such as Inventions 1-9 and 1-10 at issue, the provision in question had to be completed entirely within Japanese territory even in a formal sense, a person seeking to work such an invention could easily avoid liability for patent infringement by moving some equipment, such as servers, overseas. In today's digital society, in which numerous useful network-related inventions exist, permitting such evasive conduct would be gravely contrary to justice. On the other hand, even if not all elements of an act of working a patented invention are formally completed within Japanese territory, if, viewed substantively and as a whole, the act can be assessed as having taken place within Japanese territory, extending the effect of a Japanese patent right to it is not considered contrary to the territoriality principle described above.

Accordingly, with respect to the provision in question, it is appropriate to interpret it as constituting “provision” under the Japanese Patent Act where, considering such circumstances as whether the portions of that provision occurring outside and inside Japanese territory can be clearly and readily distinguished, whether control of that provision takes place within Japanese territory, whether that provision is directed to customers or others located within Japanese territory, and whether the effects of the patented invention obtained through that provision arise within Japanese territory, the provision can, viewed substantively and as a whole, be assessed as having taken place within Japanese territory.

c Applying this to the present case, the distribution at issue begins and is completed when users located within Japanese territory access the websites for the appellees' respective services (Exhibits Ko 3–5, 44, 46 and 47; Exhibits Hei 1–3), and it is difficult to distinguish clearly and readily the portions of that distribution occurring outside and inside Japanese territory. Control of the distribution is exercised by users located within Japanese territory, and the distribution is directed to users located within Japanese territory who wish to watch videos. Furthermore, it is only through the distribution at issue that users located within Japanese territory can watch the videos associated with Inventions 1-9 and 1-10, including adding comments, and the effects of Inventions 1-9 and 1-10 obtained through that distribution arise within

Japanese territory. In light of these circumstances, even if some portion of the distribution takes place outside Japanese territory, viewed substantively and as a whole, it is appropriate to assess it as having taken place within Japanese territory.

d In view of the foregoing, the distribution at issue constitutes “provision” under Article 2(3)(i) of the Japanese Patent Act.

IP High Court, 2021 (Ne) 10049, 10069 [Blowgun dart] <Honda> Loses on reversal (claim limitations not satisfied)

Original Ameblo publication: 2022-09-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12766769837.html

IP High Court, 2021 (Ne) 10049, 10069 [Blowgun dart] <Honda> Loses on reversal (claim limitations not satisfied)

*Resolution of the three problems addressed by the invention “may” be impeded.

⇒ The “elliptical” claim limitation is restricted to shapes having the same curvature at both ends in the longitudinal direction.

⇒ No literal satisfaction of the limitations; no equivalence.

⇒ Patentee loses on reversal (first instance: 2019 (Wa) 2675).

*The same three problems are identified in the first-instance and appellate judgments.

(Excerpts from the judgment)

⋯Given that the invention of Claim 1 describes the tip as “spherical,” and the specification also distinguishes between “spherical” and “elliptical,” it is understood at least that “elliptical” in the invention at issue … is not a term with a broad meaning that could include a circle…. …

The problems the invention seeks to solve are understood to be, in addition to the problems arising in the prior art from the presence of a “barb” at the tip of the dart—① when removing a dart from the target, only the round-nail pin remains in the target and only the film is pulled out, and ② in a double penetration, when the rear dart is pulled out, the film slips off the round-nail pin and the rear dart's pin remains inside the front dart's film …—③ an uneven vertical center of gravity caused by displacement between the head and cylindrical portion of the dart tip and overlap of the film…. …If a shape with differing curvatures is used, depending on the specific shape, a separate possibility arises that the tip with differing curvatures may remain in the target or, in a double penetration, in the front dart's film, potentially impeding resolution of the pin-separation problem…. …If a shape with differing curvatures is used, depending on the specific shape, it may become difficult to adjust its position relative to the cylindrical portion, or the features of having no unevenness in the vertical center of gravity and a relatively heavy tip may not be fully realized, potentially impeding resolution of the center-of-gravity problem…. …

⋯“Elliptical” in Claim Elements B and D is understood to include a geometrical ellipse and shapes approximating an ellipse with the same curvature at both longitudinal ends, such as the shape in the embodiment of the invention, but not shapes with differing curvatures…. …The tip of the pin in the defendant's product is “a tip whose longitudinal section traces an arc such that the front portion is a gently curved shape and the rear portion is substantially conical, whose junction with the rear cylindrical portion has upper and lower corners, and whose shape connects those rear corners with a straight line” … and should be described as a shape obtained by further cutting off one end of a shape with differing curvatures to a certain extent. It therefore does not fall within “elliptical” in Claim Elements B and D.

Appeal: IP High Court, 2020 (Ne) 10029 [Cellulose powder] <Otaka>

Original Ameblo publication: 2022-09-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12766940966.html

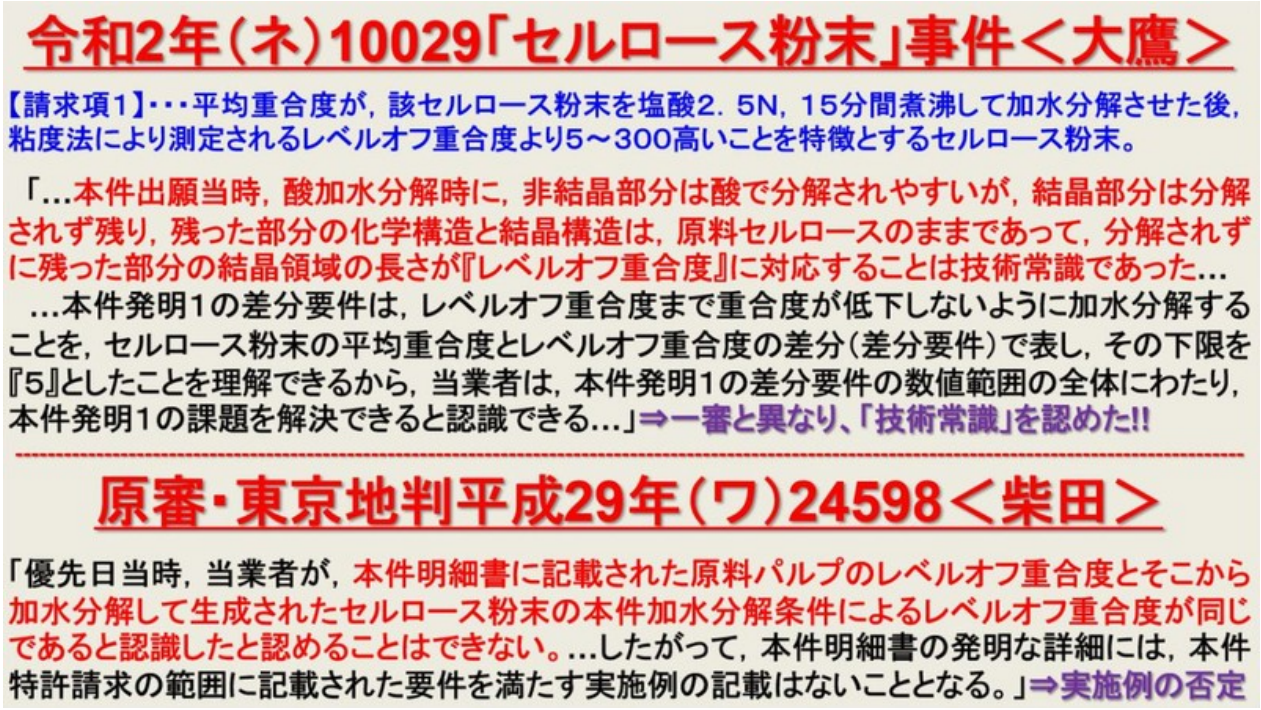
Appeal: IP High Court, 2020 (Ne) 10029 [Cellulose powder] <Otaka>

Support requirement satisfied (opposite to the first instance!!)

One document was submitted at first instance to rebut the BATTISTA paper cited in the specification, but two additional documents were submitted on appeal, reversing the original judgment.

A publicly known document published 11 years after the BATTISTA paper was decisive!!

=IP High Court, 2019 (Gyo-Ke) 10160 <Otaka>



<First instance> Tokyo District Court, 2017 (Wa) No. 24598 <Shibata>

[Claim 1] …Cellulose powder characterized in that its average degree of polymerization is 5–300 higher than the leveling-off degree of polymerization measured by viscometry after the cellulose powder is hydrolyzed by boiling in 2.5 N hydrochloric acid for 15 minutes.

(Excerpts from the judgment)

The specification states the leveling-off degree of polymerization of the respective raw-material pulps (commercial SP pulp, commercial KP pulp, etc.) for the cellulose powders of Examples 2–7 and Comparative Examples 1–11…. …At the time of filing, it was common general technical knowledge that, during acid hydrolysis, the amorphous portions are readily decomposed by acid but the crystalline portions remain undecomposed, that the chemical and crystal structures of the remaining portions are those of the original cellulose, and that the length of the crystalline regions of the undecomposed portions corresponds to the “leveling-off degree of polymerization.” In light of this, the leveling-off degree of polymerization of the cellulose powders in the above examples and comparative examples in the specification can be understood to be approximately equal to that of the raw-material pulp…. Moreover, Table 4 of the specification states the average degree of polymerization of the cellulose powders of Examples 2–7 and Comparative Examples 1–11. A person skilled in the art reading the specification is therefore considered able to ascertain whether those cellulose powders satisfy the difference requirement. Table 4 also shows the mean yield pressure [MPa], tablet water-vapor adsorption rate Ka, hardness [N], and disintegration time [seconds] for cylindrical compacts of the cellulose powders of Examples 2–7, in which the “average degree of polymerization,” “mean particle L/D (major-axis/minor-axis ratio),” “mean particle diameter,” “apparent specific volume,” “apparent tapped specific volume,” “angle of repose,” and “difference between the average degree of polymerization and the leveling-off degree of polymerization” (difference requirement) all lie within the numerical ranges of Invention 1, and for cylindrical compacts of the cellulose powders of Comparative Examples 1–11, in which any one of these lies outside those ranges. All the cellulose powders of Examples 2–7 have an angle of repose of 55° or less, tablet hardness of 170 N or more, and disintegration time of 130 seconds or less. Here, an angle of repose exceeding 55° markedly worsens flowability …; tablet hardness is a practical physical-property value indicating moldability, and 170 N or more is preferred …; and disintegration time is a practical physical-property value indicating disintegrability, and 130 seconds or less is preferred…. Thus, the cellulose powders of Examples 2–7 can be described as cellulose powders combining moldability, flowability, and disintegrability in a well-balanced manner. Accordingly, a person skilled in the art … can recognize that the cellulose powders of Examples 2–7 can solve the problem of Invention 1…. …

…From the statements … in the specification …, it can be understood that, if cellulose powder is hydrolyzed down to the leveling-off degree of polymerization, the L/D of the cellulose particles before drying tends to decrease, the cellulose particles aggregate in the subsequent drying step, the L/D of the resulting cellulose powder becomes smaller, and a smaller L/D reduces moldability. It can also be understood that the difference requirement of Invention 1 expresses hydrolysis that does not reduce the degree of polymerization to the leveling-off degree of polymerization in terms of the difference between the average degree of polymerization of the cellulose powder and its leveling-off degree of polymerization (the difference requirement), with a lower limit of "5." A person skilled in the art is therefore found able to recognize that the problem of Invention 1 can be solved throughout the numerical range of its difference requirement.…

English translation of the figure

IP High Court, 2020 (Ne) 10029, "Cellulose Powder" <Otaka>.

[Claim 1] … Cellulose powder characterized in that its average degree of polymerization is 5–300 higher than its level-off degree of polymerization, measured by a viscosity method after the cellulose powder is hydrolyzed by boiling in 2.5 N hydrochloric acid for 15 minutes.

"… At the time of the application at issue, it was common general technical knowledge that, during acid hydrolysis, the noncrystalline portions are readily decomposed by acid while the crystalline portions remain without decomposition; that the chemical and crystalline structures of the remaining portions are the same as those of the raw-material cellulose; and that the length of the crystalline regions of the portions remaining without decomposition corresponds to the 'level-off degree of polymerization.' …

… It can be understood that the feature constituting the difference in Invention 1 at issue expresses hydrolysis such that the degree of polymerization has not decreased to the level-off degree of polymerization by the difference between the average degree of polymerization and the level-off degree of polymerization of the cellulose powder (the feature constituting the difference), and sets its lower limit at '5.' A person skilled in the art can therefore solve the problem of Invention 1 at issue throughout the numerical range of the feature constituting the difference in Invention 1 at issue. …" ⇒ Unlike the first instance, "common general technical knowledge" was recognized!!

First instance: Tokyo District Court, 2017 (Wa) 24598 <Shibata>.

“At the priority date, a person skilled in the art could not recognize that the level-off degree of polymerization of the raw-material pulp described in the specification at issue was the same as the level-off degree of polymerization under the hydrolysis conditions at issue of the cellulose powder produced by hydrolyzing that pulp. … Accordingly, the detailed description of the invention in the specification at issue contains no description of an example satisfying the features recited in the claims at issue.” ⇒ The examples were denied.

Tokyo District Court, 2019 (Wa) 7038, 9618 <Kokubu> Graphitic carbon material used as a graphene precursor

Original Ameblo publication: 2022-10-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12767455613.html

Tokyo District Court, 2019 (Wa) 7038, 9618 <Kokubu>

[Graphitic carbon material used as a graphene precursor]

Since before the patent application's filing date: ① product names/numbers were the same; ② there were no major changes to the manufacturing processes and no changes to product specifications; ③ pre-filing samples included products within the invention's numerical range.

⇒ Public working established (no novelty).

(Excerpts from the judgment)

⋯(c) Whether Nippon Graphite and the other parties had manufactured and sold the respective Nippon Graphite products falling within the technical scope of the inventions at issue since before the patent application

⋯Most factors thought to affect an increase in rhombohedral graphite layers can be said to relate to graphite-product manufacturing processes and the specifications the manufactured products must satisfy. However, even all the evidence presented in this litigation does not establish specifically which operations under which conditions not only increase rhombohedral graphite layers but cause what degree of fluctuation in Rate (3R), the proportion of rhombohedral graphite layers in the sum of rhombohedral and hexagonal graphite layers.… Nippon Graphite Industries has manufactured the respective Nippon Graphite products since before the patent application, and from before the application to the present there have been no major changes to their manufacturing processes or to the specification values serving as shipment criteria.… The plaintiff sued Nippon Graphite and the other parties in March 2019 on the basis of the Nippon Graphite product results, and it cannot be said that a particularly long period had elapsed since the patent application of September 9, 2014.

Accordingly, Nippon Graphite and the other parties have manufactured and sold graphite products bearing the respective names of the Nippon Graphite products from before the patent application to the present. During this period, there have been no changes to the manufacturing processes or specification values of these products that are thought to influence increases or decreases in rhombohedral graphite layers. The Nippon Graphite products manufactured and sold during this period are therefore found to have undergone the same manufacturing processes and satisfied the same specifications. No other circumstances are found to have existed that would affect increases or decreases in their Rate (3R), and … at present, Nippon Graphite Products 1–3 fall within the technical scope of the respective inventions, while Nippon Graphite Products 4 and 5 fall within that of Invention 1. In light of these circumstances, it is appropriate to find that Nippon Graphite and the other parties had manufactured and sold such Nippon Graphite products since before the patent application. …The fact that Nippon Graphite Products 4 and 5 sampled in 2008, before the patent application, had Rate (3R) values of 31% or more also supports this conclusion….

Although Sample Results ③ for Nippon Graphite Product 2 differ from the Exhibit Otsu A18 Results, Nippon Graphite Product 2 is earthy graphite, and the peaks around diffraction angles of 43–44°, where the respective (101) peaks of rhombohedral graphite layers (3R) and hexagonal graphite layers (2H) are said to appear, are not necessarily clear. …Where peaks are unclear, PDXL's automatic analysis function may converge on an unreasonable solution or diverge. Given also the variation between Sample Results ③ and the Exhibit Otsu A18 Results for Nippon Graphite Product 1, which is likewise earthy graphite, the

difference between Sample Results ③ and the Exhibit Otsu A18 Results for Nippon Graphite Product 2 cannot be said to alter the above finding that Nippon Graphite and the other parties had manufactured and sold Nippon Graphite Product 2 falling within the technical scope of the inventions since before the patent application.…

The plaintiff argues that, even if third parties acquired products implementing the inventions from the defendants, Nippon Graphite and the other parties, or Chuetsu Graphite, they could not have learned the configurations or compositions of the inventions. However, …at the time of the patent application, persons skilled in the art performed X-ray diffraction measurements to determine the crystal structure of substances and calculated peak areas (integrated intensities) by analyzing the resulting diffraction profiles. The cost, effort, and time involved in commissioning an outside specialist organization to perform such analysis are not found to prevent a determination that the inventions had been publicly worked.…

The plaintiff argues that identical product names and numbers for products sold before the patent application and those sold recently do not establish that the products are identical. However, it is a fact judicially known to this court that product quality is frequently controlled by product names and numbers. In addition to this circumstance, …considering that the defendants, Nippon Graphite and the other parties, and Chuetsu Graphite made no major changes to product manufacturing processes and no changes to product specifications before and after the patent application, and that pre-filing product samples include those with a Rate (3R) of 31% or more or 40% or more, …it is appropriate to find that the defendants, Nippon Graphite and the other parties, and Chuetsu Graphite had manufactured and sold products falling within the technical scope of Invention 1 or the respective inventions since before the patent application.

IP High Court, 2019 (Ne) 10078 <Kanno> [Construction method for a roof chimney penetration and waterproof structure for a roof chimney penetration]

Original Ameblo publication: 2022-10-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12767455826.html

IP High Court, 2019 (Ne) 10078 <Kanno>

[Construction method for a roof chimney penetration and waterproof structure for a roof chimney penetration]

Construction in circumstances visible from outside

⇒ Public working

“The neighboring land on the side … where the stove chimney projects from the roof of A's residence … is higher than A's residence … and the chimney is sufficiently visible from that parking lot.”

(Excerpts from the judgment)

Regarding the argument that the work at A's residence was not carried out “publicly,” the appellant contends that the work cannot be described as publicly performed because A's residence is surrounded by walls and vegetation and cannot readily be viewed from outside; it is surrounded by mountains and has few neighboring residents; and the work took place on the roof, making its details difficult to ascertain from outside. However, …the neighboring land on the side where the stove chimney projects from A's roof (the front side of the chimney) was a parking lot at the time of the work … and is found to be higher than the property of A's residence…. The chimney is sufficiently visible from that parking lot, and there is no indication that the work was performed in a manner intended to prevent third parties from seeing it.… The construction method and waterproof structure used at A's residence … are not complex, and a person skilled in the art … is found able to understand these inventions technically.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-90037.pdf

IP High Court, 2019 (Gyo-Ke) 10043 “High-contrast tire pattern” <Tsuruoka>

Original Ameblo publication: 2022-10-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12767626006.html

IP High Court, 2019 (Gyo-Ke) 10043 “High-contrast tire pattern” <Tsuruoka>

*A case in which combining a secondary reference solving a different problem from the primary reference was found obvious “for another reason.”

⇒ No inventive step for an invention with numerical limitations.

*Exhibit Ko 2 contains no concept of increasing contrast, but even so, a combination with the Exhibit Ko 1 invention would be attempted for another reason.

(Excerpts from the judgment)

[Difference 2] Invention 3 contains the feature that “the blade wall has a mean roughness Rz of 5 μm to 30 μm over at least one-quarter of its area, and the blade wall having this mean roughness is located in the bottom quarter of the blade height,” whereas the Exhibit Ko 1 invention does not specify the mean roughness of the wall-like structure formed by numerous narrow grooves 4.…

…Improving the distinguishability of an indication mark is one means of improving a tire's appearance; if there is a means of further improving the appearance of the tire in the Exhibit Ko 1 invention, that would be desirable.… Because Exhibit Ko 2 is stated to have the purpose of improving appearance, a person skilled in the art encountering the Exhibit Ko 1 invention would be expected to consider the matters described in Exhibit Ko 2.…

The matters described in Exhibit Ko 2 are considered suitable for further improving the appearance of the tire in the Exhibit Ko 1 invention, including the indication-mark portion. A person skilled in the art therefore has sufficient motivation to attempt to combine the matters described in Exhibit Ko 2 with the Exhibit Ko 1 invention.

…Exhibit Ko 2 contains no concept of increasing contrast, but even so, it is clear from the foregoing that a combination with the Exhibit Ko 1 invention would be attempted for another reason.

090450_hanrei.pdf (courts.go.jp)

Tokyo District Court, 2003 (Wa) 19324 [Method for producing Branut granules] <Mimura>

Original Ameblo publication: 2022-10-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12768798363.html

Tokyo District Court, 2003 (Wa) 19324 [Method for producing Branut granules] <Mimura>

Taking the prosecution history into account as well,

“…adjusting to 30°C–0°C”

was interpreted

to mean “actively adjusting the temperature by some means so as to bring the temperature of the kneaded material supplied to the extrusion granulator to 30–0°C.”

⇒ Claim limitation not satisfied

[Claim 1] …A method for producing pharmaceutical granules … characterized by adjusting the temperature of the kneaded material supplied to the extrusion granulator to 30°C–0°C.

(Excerpts from the judgment)

⋯In the invalidation decision …, “adjusting the temperature of the kneaded material supplied to the extrusion granulator to 30°C–0°C” within the scope of the second patented invention at issue was held not to mean merely the state in which “the temperature of the kneaded material supplied to the extrusion granulator is 30°C–0°C.” Rather, it means, for example, detecting the temperature of the kneaded material supplied to the granulator and performing the processing necessary to maintain the set temperature range; otherwise, it cannot be said to be “adjusted.” In accordance with this interpretation, the second patented invention was distinguished from prior art in which the temperature might naturally remain at 30–0°C but which disclosed nothing about active temperature adjustment, and it was held that such prior art did not negate the novelty of the second patented invention.

In light of the foregoing history, …“adjusting the temperature of the kneaded material supplied to the extrusion granulator to 30°C–0°C” means, even if it does not necessarily require “providing a means of temperature adjustment,” at least actively adjusting the temperature by some means so as to bring the temperature of the kneaded material supplied to the extrusion granulator to 30–0°C (for example, setting the temperature of the water used during kneading considerably lower). It does not encompass a case where the temperature of the kneaded material naturally remains at 30–0°C because of the working environment….

Tokyo High Court, 2002 (Ne) 2457 [Method for reusing ready-mixed concrete sludge] <Yamashita>

"Even if the defendant's method shares a point with the invention in that it includes cases where … the concentration happens to be 20.2 wt% or less and no adjustment is necessary, …it cannot be said that 'adjustment' is being made…."

⇒ Claim limitation not satisfied

[Claim 1] …A method for reusing ready-mixed concrete sludge, characterized by adjusting … the solids concentration of the ready-mixed concrete sludge to 20.2 wt% or less….

(Excerpts from the judgment)

…"Adjustment" generally means "putting in order, eliminating excesses and deficiencies, and making appropriate" (Kojien, 4th edition), or "① putting in order; ② putting in order to meet a certain standard, eliminating excesses and deficiencies; ③ bringing into a balanced state" (Daijirin). In light of the general meaning of "adjustment" above (particularly putting in order to meet a certain standard), absent special circumstances requiring a contrary interpretation, it is appropriate to construe "adjusting the solids concentration of ready-mixed concrete sludge to 20.2 wt% or less" in Claim Element C as bringing the concentration into conformity with the standard of 20.2 wt% or less: specifically, measuring the solids concentration and, if it exceeds 20.2 wt%, performing an operation to reduce it to 20.2 wt% or less…. Even if the defendant's method shares a point with the invention in that it includes cases where the measured solids concentration happens to be 20.2 wt% or less and no adjustment is necessary, this does not permit a finding that "adjustment" is being made in the defendant's method.

*Determining the size and number of holes to release water vapor appropriately is a matter of design.

“Determining the diameter and number of small holes … and the total opening area … in consideration of the amount of water vapor that may arise from the food inside the container, so as to release water vapor appropriately … is a matter of design.”

[Claim 1] …A container for microwave-heated food … wherein the diameter of the exhaust pores is 0.15–0.59 mm, the number of the exhaust pores is 8–1,000, and the total opening area of the exhaust pores in the exhaust-hole group is 0.25–100 mm²….

(Excerpts from the judgment)

The small holes of the cited invention are formed in “an appropriate number and with an appropriate size of about 0.5–1 mm in diameter, capable of reliably discharging heated air and water vapor from inside the container.” Exhibit Ko 2 contains no specific disclosure concerning this “appropriate” size and number. However, it is obvious to a person skilled in the art that, if the amount of water vapor generated by the contents of the container changes, the size (diameter) and number of the holes that release water vapor must also be changed accordingly to release it appropriately…. Thus, for a person skilled in the art encountering the cited invention, determining the diameter and number of small holes and the total opening area readily calculated from them, in consideration of the amount of water vapor that may arise from the food inside the container, so as to release water vapor appropriately, is merely a matter of design.

Original Ameblo publication: 2022-10-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12769306624.html

2019 (Wa) 23407 […Suspension … apparatus] <Shibata>

Literal construction of “adjustment means”

⇒ Although not recited in the claims, the specification described advance adjustment after recognizing the difference as the principle for solving the problem, and contained no description of a way to solve it by other means.

⇒ Construed narrowly to the scope capable of solving the problem.

The defendant's product is an ordinarily used connecting member and does not make an adjustment.

⇒ Claim limitation not satisfied

(Excerpts from the judgment)

⋯The “adjustment means” (Claim Element C) of the invention is understood to mean a means for changing the length in advance to match the recognized difference at issue as a reference, in order to suspend and stretch the suspended body appropriately, without excess or deficiency. …Even if a suspension apparatus has some configuration for changing length, if it is not recognized as a means for changing the length of the lifting wire or the like in advance to match the difference at issue as a reference, it is not the invention's “adjustment means.” If merely a means for changing length were construed as the adjustment means of the invention, when changing the length of the lifting wire or the like during installation or maintenance of the suspended body, it would be necessary to use some other means to match that difference as a reference. However, the specification and other materials do not establish that such work could be performed entirely from the floor side, and such a configuration cannot solve the problem of the invention. The specification states here that the length of the lifting wire can also be adjusted by providing the lifting wire with an engaging member for the net body, or by providing the net body with an engaging member for the lifting wire (paragraph [0058]). In light of the foregoing, where such an engaging member can be described as a means for changing the length of the lifting wire or the like in advance to match the recognized difference as a reference, it can be described as the invention's “adjustment means,” and the above description can be understood in that sense. Conversely, an engaging member that cannot be described as such a means and has no configuration or function beyond those of an ordinary engaging member is, in light of the foregoing, an engaging member used independently of the invention; it does not produce the effects of the invention's “adjustment means” and is not found to fall within that term.… The wire clip in … the defendant's product … is found to be a connecting member ordinarily used to secure a wire….

2019 (Wa) 23164 [Image-forming apparatus] <Tanaka>

*The child application violated the divisional-application requirements.

⇒ The grandchild application's filing date goes back only to the child application's actual filing date.

=Osaka High Court, 2002 (Ne) 2776

=Tokyo High Court, 2003 (Gyo-Ke) 65

*Additional statements in the specification were the reason for the violation of the divisional requirements.

⇒ The first such case since the Artificial Nipple case (Tokyo High Court, 2002 (Gyo-Ke) 539)!?

(Excerpts from the judgment)

⋯The patent application at issue is a divisional application of Application 3, which is itself a divisional application of Application 2, which in turn is a divisional application of Application 1. Because the defendant argues that Application 2 violates the divisional requirements, this point will be considered.

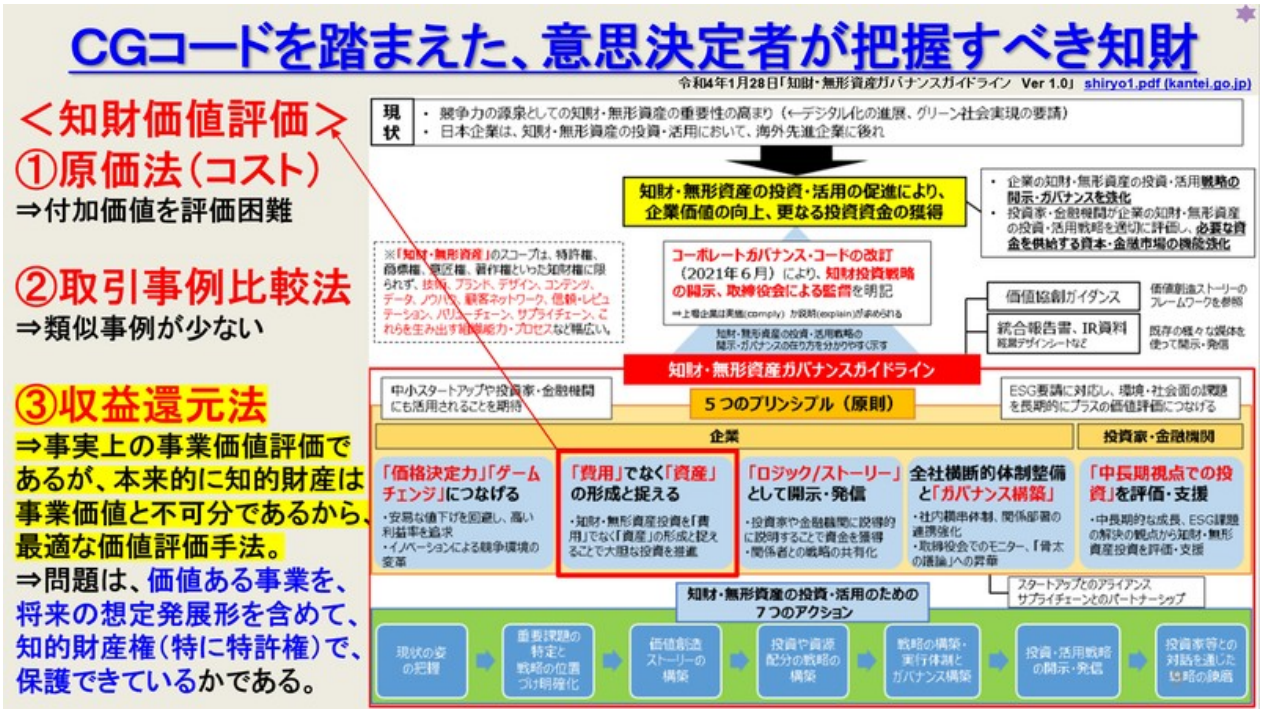
…Where a divisional application is lawful, its effect relates back to the filing date of the original application (main text of Article 44(2) of the Patent Act), but where it is unlawful, substantive examination is conducted using the date on which the divisional application was filed as the reference date. It is appropriate to interpret the requirements for a divisional application's filing date to relate back to that of the original application as follows: ① the matters described in the divisional application's specification and other documents must be within the scope of the matters described in the original application's specification and other documents as initially filed; and ② they must be within the scope of the matters described in the original application's specification and other documents immediately before division. Where an application is divided during a period when the original application's specification and other documents may be amended, satisfying requirement ① is understood also to satisfy requirement ②. However, Application 2 was not filed … during a period when the specification and other documents of Application 1 could be amended…. Thus, as divisional requirements for Application 2, requirement ② must also be satisfied separately from requirement ①.…

…Comparing the specification and other documents of Application 1 at the time Application 2 was filed as a divisional application—that is, those at the time of the decision to grant Application 1 …—with the specification and other documents of Application 2 (the specification at division of Application 2 …), the latter differs from the specification at grant of Application 1 in that it adds, for example, a description of retaining processing conditions even after power-off through a designation-retention instruction unit and displaying them on the first screen shown on subsequent occasions (paragraph [0100]); a description of reducing the number of magnification settings, a frequently used processing condition, and reducing the number of menu settings by displaying “one higher” and “one lower” to specify magnification (paragraph [0105]); a description of preventing erroneous instructions from casual menu changes by providing a means to lock registered menus against changes (paragraph [0145]); and Figures 7–15 and related descriptions (paragraph [0041] …). Because the specification at division of Application 2 contains matters absent from the specification at grant of Application 1, it cannot be said to be within the scope of the matters described in the latter…. Application 2 therefore fails to satisfy divisional requirement …② and must be said to violate the divisional requirements; Article 44(2) of the Patent Act does not apply to Application 2.

…Accordingly, even if the patent application at issue satisfies the divisional requirements in relation to Application 3, and Application 3 satisfies them in relation to Application 2, Application 2 does not satisfy them in relation to Application 1. The filing date of Application 2 therefore does not relate back to that of Application 1, but is its actual filing date …, and likewise the filing date to which the patent application at issue relates back is the filing date of Application 2….

https://www.nakapat.gr.jp/ja/legal_updates_jp/%e3%80%90%e7%89%b9%e8%a8%b1%e2%98%85%e2%98%85%e3%80%91%e5%af%a9%e6%b1%ba%e5%8f%96%e6%b6%88%e8%ab%8b%e6%b1%82%e4%ba%8b%e4%bb%b6%ef%bc%88%e8%a6%aa%e3%83%bb%e5%ad%90%e3%83%bb%e5%ad%ab%e3%81%a8/

Intellectual property that decision-makers should understand in light of the CGC (Corporate Governance Code)



Original Ameblo publication: 2022-10-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12769637481.html

【YouTube #short】 Intellectual property that decision-makers should understand in light of the CGC (Corporate Governance Code)

It is important for management to view investment in intellectual property and intangible assets as the creation of “assets,” not single-year “expenses,” and thereby remain conscious not to make it an easy target for cuts.

https://youtube.com/shorts/_LC19RQjb-A

English translation of the figure

Intellectual property that decision-makers should understand in light of the Corporate Governance Code.

Intellectual property valuation: (1) Cost approach — added value is difficult to evaluate. (2) Comparable-transaction approach — there are few similar cases. (3) Income approach — in substance it evaluates business value; however, because intellectual property is inherently inseparable from business value, it is the optimal valuation method. The question is whether the valuable business, including its anticipated future forms of development, is protected by intellectual property rights (particularly patents).

Current situation: The importance of intellectual property and intangible assets as sources of competitiveness is increasing, driven by progress in digitalization and calls to realize a green society. Japanese companies lag behind leading overseas companies in investment in and use of intellectual property and intangible assets.

Promoting investment in and use of intellectual property and intangible assets → increasing corporate value and obtaining further investment funds.

Strengthen disclosure and governance of companies' strategies for investing in and using intellectual property and intangible assets. Strengthen the functions of capital and financial markets so that investors and financial institutions appropriately evaluate those strategies and provide the necessary funds.

The scope of "intellectual property and intangible assets" is broad: it is not limited to intellectual property rights such as patents, trademarks, design rights and copyright, but also includes technology, brands, designs, content, data, know-how, customer networks, trust and reputation, value chains, supply chains, and the organizational capabilities and processes that create these.

Revision of the Corporate Governance Code (June 2021) expressly requires disclosure of intellectual property investment strategies and supervision by boards of directors. Listed companies are required to comply or explain.

Guidelines on Governance of Intellectual Property and Intangible Assets: clearly show how disclosure and governance should operate for investment in and use of intellectual property and intangible assets. Guidance for Collaborative Value Creation: consult the value-creation-story framework. Integrated reports, investor-relations materials, management-design sheets and other existing media: use various media for disclosure and communication.

Five principles. Companies: (1) Connect investment and use to "pricing power" and "game changing": avoid easy price reductions and pursue high profit margins; transform the competitive environment through innovation. (2) Treat them as formation of "assets," rather than "costs": promote bold investment by treating investment in intellectual property and intangible assets as asset formation. (3) Disclose and communicate as "logic/stories": obtain funds by explaining persuasively to investors and financial institutions; share strategies among stakeholders. (4) Establish cross-company structures and "governance": strengthen cooperation among internal horizontal structures and related departments; have the board monitor, raising the discussion to an "outside" perspective. Investors and financial institutions: (5) Evaluate and support "investment from a medium- to long-term perspective": evaluate and support intellectual property and intangible-asset investment from the standpoint of medium- and long-term growth and resolution of ESG issues.

The guidelines are expected to be used by small and medium-sized enterprises, startups, investors and financial institutions as well. Respond to ESG demands and connect environmental and social issues to positive value creation over the long term. Alliances with startups; partnerships with supply chains.

Seven actions for investment in and use of intellectual property and intangible assets: grasp the current situation → identify important issues and clarify the positioning of the strategy → build a value-creation story → build a strategy for allocating investment and resources → build the strategy, implementation structure and governance → disclose and communicate the investment/use strategy → refine it through dialogue with investors and others.

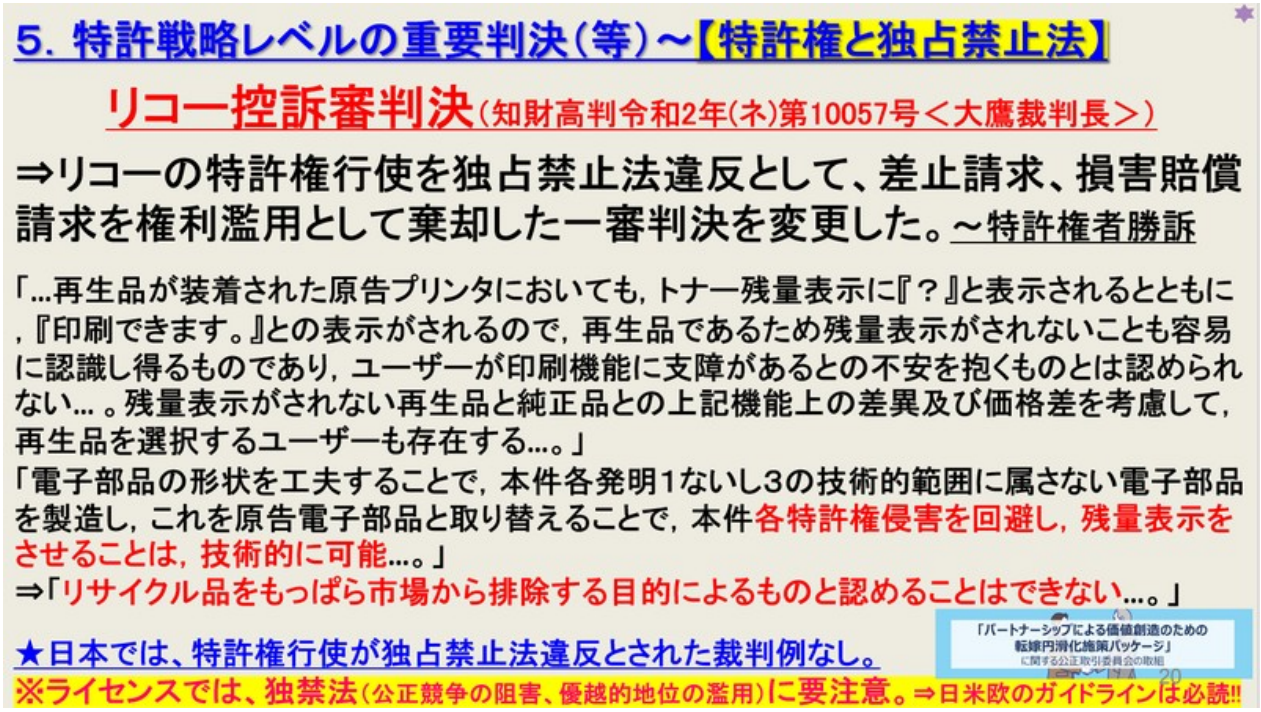
January 28, 2022, Guidelines on Governance of Intellectual Property and Intangible Assets, Version 1.0. shiryo1.pdf (kantei.go.jp).

[Patents: Case introduction (YouTube)] IP High Court, 2020 (Ne) 10057 <Otaka>

Original Ameblo publication: 2022-10-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12769637718.html

[Patents: Case introduction (YouTube)] IP High Court, 2020 (Ne) 10057 <Otaka>



The first-instance judgment holding patent enforcement to be an abuse of rights in violation of the Antimonopoly Act was modified.

⇒ Patentee wins on reversal.

“It is technically possible to display the remaining amount while avoiding infringement of the patents at issue.”

—The purpose was not solely to exclude recycled products from the market.

https://youtube.com/watch?v=IMeI3-Rlbd8

English translation of the figure

5. Important judgments and other matters at the patent-strategy level — patent rights and the Antimonopoly Act. Ricoh appellate judgment: IP High Court, 2020 (Ne) 10057 <Presiding Judge Otaka>.

The appellate court reversed the first-instance judgment, which had treated Ricoh’s exercise of its patent rights as violating the Antimonopoly Act and dismissed the claims for an injunction and damages as an abuse of rights. The patentee prevailed.

“… Even in the plaintiff’s printer fitted with a recycled product, the remaining-toner display shows ‘?’ together with the message ‘Printing is possible.’ It is therefore easy to recognize that the remaining amount is not displayed because the product is recycled, and it cannot be found that the user would feel concern about an impediment to the printing function. … There are also users who select recycled products in consideration of the difference in function and price between recycled products without a remaining-amount display and genuine products. …”

“By devising the shape of the electronic component, manufacturing an electronic component outside the technical scope of Inventions 1 to 3 at issue, and replacing the original electronic component with it, it is technically possible to avoid infringement of the patents at issue and provide a remaining-amount display. …” ⇒ “… The purpose cannot be found to be solely to exclude recycled products from the market. …”

There is no Japanese judgment holding that exercise of a patent right violated the Antimonopoly Act. When granting licenses, attention must be paid to the Antimonopoly Act (obstruction of fair competition and abuse of a superior bargaining position). Read the Japanese, US and European guidelines!!

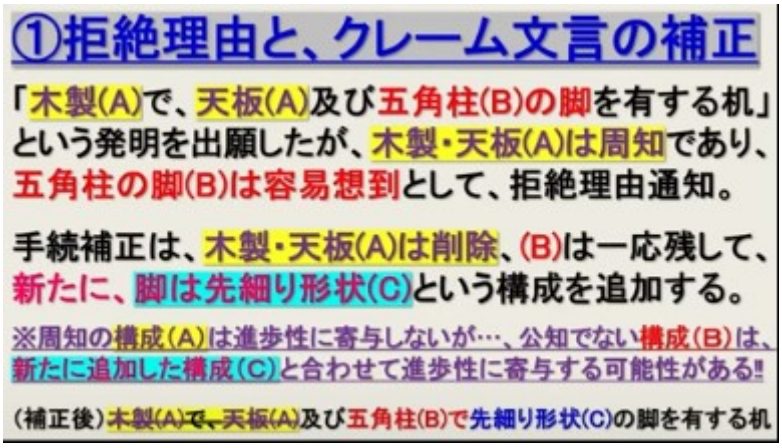
Guidelines for Promoting Appropriate Transactions to Create Value through Partnership, Cabinet Secretariat and Japan Fair Trade Commission (2022 edition).

[Patent YouTube #short] ① Responding to rejections; ② Utilizing dependent claims (claim differentiation)

Original Ameblo publication: 2022-10-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12769637942.html

[Patent YouTube #short] ① Responding to rejections; ② Utilizing dependent claims (claim differentiation)



① Responding to rejections

⇒ Delete features that do not contribute to inventive step and broaden the invention while keeping it strong.

② Utilizing dependent claims (claim differentiation)

⇒ If a dependent claim includes the limiting feature, the “problem” can be characterized as the dependent claim's problem, avoiding a restrictive construction of the independent claim!

(30) [Patents] ① Responding to rejections; ② Utilizing dependent claims (claim differentiation); ⑩ Utilizing separate applications #shorts - YouTube

English translation of the figure

1. Grounds for rejection and amendment of claim wording.

An application was filed for an invention of “a desk made of wood (A), having a top board (A) and pentagonal-prism (B) legs,” but a notice of reasons for rejection was issued on the grounds that wood and a top board (A) were well known and pentagonal-prism legs (B) were easily conceivable.

In the amendment, wood and the top board (A) are deleted; (B) is maintained for the time being; and the new feature that the legs have a tapered shape (C) is added.

Although the well-known features (A) do not contribute to inventive step, the publicly known feature (B) may contribute to inventive step in combination with the newly added feature (C)!!

After amendment: a desk [“made of wood (A), having a top board (A)” deleted] having legs that are pentagonal prisms (B) and have a tapered shape (C).

IP High Court, 2021 (Gyo-Ke) 10006 [X-ray inspection apparatus] <Kanno>

Original Ameblo publication: 2022-10-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12769802791.html

IP High Court, 2021 (Gyo-Ke) 10006 [X-ray inspection apparatus] <Kanno>

The problems of the primary and secondary references were understood abstractly and found to be the same.

⇒ Obvious

"Cited Invention 1 …, an X-ray detection apparatus inspecting food and the like for foreign matter, and the technical matters of Cited Document 2 …, which performs medical and baggage inspections, are related as technical fields in which X-ray inspection apparatuses are used…."

(Excerpts from the judgment)

The technical matters of Cited Document 2 enable detection of drugs concealed in baggage or the human body, or prohibited articles such as explosives and ivory, by using highly absorbed X-rays specific to a substance. It is therefore not only for the human body, but also an X-ray baggage inspection apparatus that checks for invisible objects in baggage…. Thus, the technical field of Cited Invention 1, an X-ray detection apparatus inspecting food and the like for foreign matter, and the technical field of the technical matters of Cited Document 2, which performs medical and baggage inspections, are related as technical fields in which X-ray inspection apparatuses are used…. …Cited Invention 1 and the technical matters of Cited Document 2 have close relationships and commonality in technical field, problem to be solved, and action and function … there is strong motivation to combine them….

⋯Because Cited Invention 1 is a foreign-matter inspection apparatus that checks workpieces on a conveyor path for metal and other foreign matter, it is an apparatus for a product-manufacturing site. Even if Cited Document 2 directly contemplates use of its technical matters in medical inspection apparatuses, the level of cost to be incurred is not directly linked to technical field. Disregarding the nature of the product, the scale of the manufacturing site, and the product's sales channels, it certainly cannot be said that apparatuses for product-manufacturing sites uniformly need only be low-performance products, or that persons skilled in the art pay no attention to performance improvements and are unconcerned with technologies for medical inspection apparatuses….

[US Patents] 2016.06 US Supreme Court Cuozzo Speed v. Lee

Original Ameblo publication: 2022-10-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12770138615.html

[US Patents] 2016.06 US Supreme Court Cuozzo Speed v. Lee

Under the rules in force at the time of the 2016 decision, claims in IPR proceedings were construed under the Broadest Reasonable Interpretation (BRI) standard.

Under the claim-construction rules then in force, IPR could be more favorable to the petitioner challenging validity than an invalidity defense in federal district court.

https://www.oliff.com/ja/ipr%E3%81%AB%E3%81%8A%E3%81%91%E3%82%8B%E6%9C%80%E3%82%82%E5%B9%85%E3%81%AE%E5%BA%83%E3%81%84%E7%90%86%E5%B1%88%E3%81%AB%E9%81%A9%E3%81%A3%E3%81%9F%E8%A7%A3%E9%87%88%E3%81%AE%E5%9F%BA%E6%BA%96/

Tokyo District Court, 2020 (Wa) 33027 [Control system for fee-charging automatic machines] <Nakashima>

Original Ameblo publication: 2022-10-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12770298882.html

2020 (Wa) 33027 [Control system for fee-charging automatic machines] <Nakashima>

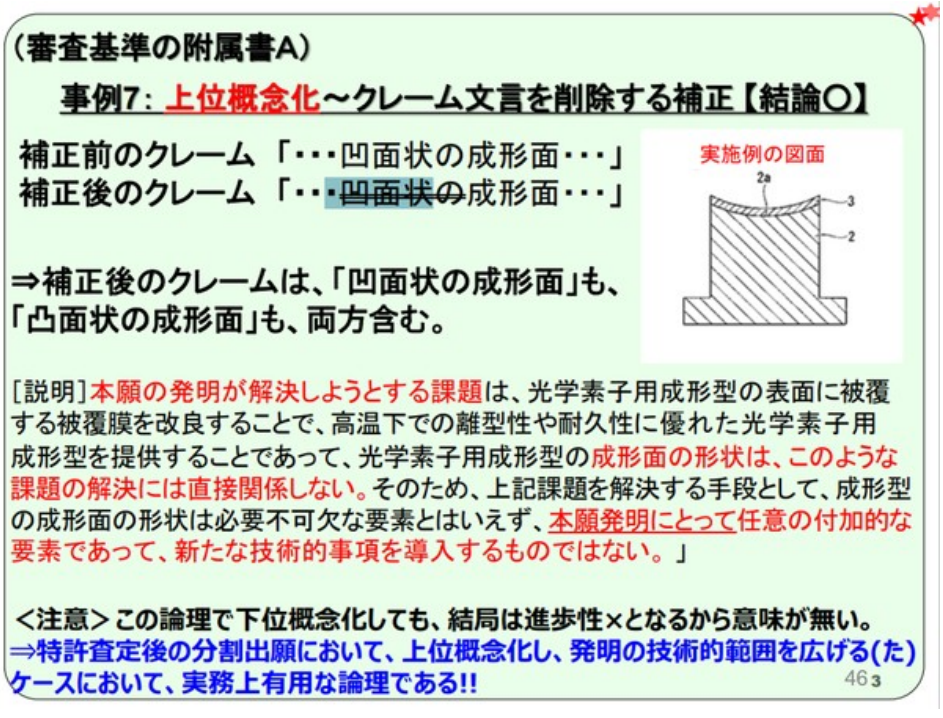
*An amendment generalizing a concept violated the amendment requirements because it was not “obvious” from the original specification and other documents.

⇒ The following permit amendment where the deleted matter specifying the invention is not directly related to the invention's problem:

Examination Handbook, Annex A, section 7 (Amendments Adding New Matter), Example 7;

IP High Court, 2014 (Gyo-Ke) 10087 [Rack transport apparatus] case <Shitara>;

IP High Court, 2017 (Gyo-Ke) 10089, 10090 [Medical flexible container] case <Takabe>.



I want to examine that consistency!!

(Excerpts from the judgment)

…The amendment excluded the “sensor detecting operation of the fee-charging automatic machine” from the patented configuration, and changed it to a configuration in which “information indicating whether the connected laundry apparatus is in operation,” generated by an “apparatus having an IC card reader/writer unit and a communication unit,” is transmitted to a management server…. …The original specification and other documents disclose no method whatsoever of determining whether the fee-charging automatic machine is operating, or inferring that result, on the basis of information other than the detection signal of the sensor detecting its operation…. Moreover, it cannot be found that, for a person skilled in the art reading the original specification and other documents, the amended matters were obvious from those documents in light of common general technical knowledge at the time of filing.…

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91267.pdf

English translation of the figure

The “resolution of the invention described in the specification,” taking patentability requirements into account ⇒ divisional-application strategy.

Appendix A to the Examination Handbook. Example 7: generalization — amendment deleting claim wording [conclusion: permitted].

Claim before amendment: “… concave molding surface …”. Claim after amendment: “… [the word ‘concave’ deleted] molding surface …”. ⇒ The amended claim includes both a “concave molding surface” and a “convex molding surface.” Drawing of the embodiment: labels 2a, 1, 3 and 2.

[Explanation] “The problem to be solved by the invention of this application is to improve the coating film covering the surface of an optical-element molding die, thereby providing an optical-element molding die with excellent releasability at high temperatures and durability. The shape of the molding surface of the optical-element molding die is not directly related to solving that problem. Therefore, the shape of the molding surface of the molding die is not an indispensable element as a means of solving the above problem, but an optional additional element for the invention of this application, and it does not introduce a new technical matter.”

Caution: Even if a more specific concept is adopted using this reasoning, the conclusion will be lack of inventive step, so there is little significance. ⇒ In a divisional application after allowance, generalize and expand the technical scope of the invention! Depending on the case, this is very useful reasoning in practice!!

Tokyo District Court, 2021 (Wa) 13905 […Use of eribulin] <Shibata>

Original Ameblo publication: 2022-10-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12770455037.html

Tokyo District Court, 2021 (Wa) 13905 […Use of eribulin] <Shibata>

*Because the patents exist, Ministry of Health, Labour and Welfare manufacturing approval and drug-price listing are not highly probable.

⇒ A claim for a declaration of the nonexistence of a “future” right to enjoin a generic drug lacks an interest in bringing suit.

*For “current” manufacture (testing and research), there is no infringement and no intention to enforce the rights, so there is no interest in bringing suit.

⇒ Action dismissed as inadmissible

(Excerpts from the judgment)

In this case, it is not found highly probable that the Minister of Health, Labour and Welfare will approve manufacture and sale of the plaintiff's pharmaceutical product or that it will be listed in the drug-price standard in the near future; consequently, it is not found highly probable that the plaintiff will manufacture and sell its pharmaceutical product…. It is by no means certain that a legal dispute will arise in the near future between the plaintiff and the defendants over the nonexistence of defendant Eisai RD's right to seek an injunction against the plaintiff based on the patents at issue, or the defendants' rights to claim tort damages against the plaintiff for infringement of those patents. There is insufficient basis to find a present danger or uncertainty concerning the plaintiff's rights or legal status.

Accordingly, the plaintiff's action against the defendants seeking declarations that, if the plaintiff's pharmaceutical product is listed in the drug-price standard in the future, defendant Eisai RD will have no right to seek an injunction against the plaintiff under the patents at issue and the defendants will have no right to claim tort damages against the plaintiff for infringement of those patents must be said to lack an interest in seeking declaratory relief.

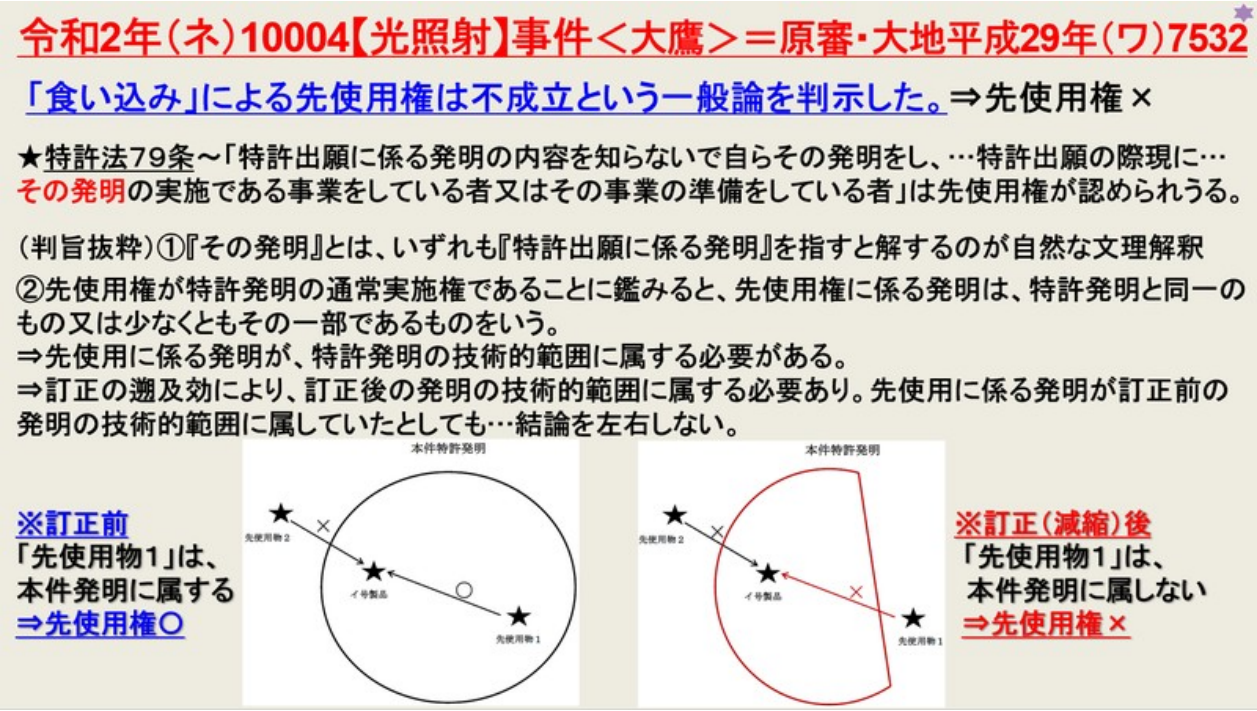
[Individual Patent Case Introduction (YouTube)] IP High Court, 2020 (Ne) 10004 [Light irradiation] case <Otaka>

Original Ameblo publication: 2022-10-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12770530756.html



[Individual Patent Case Introduction (YouTube)] IP High Court, 2020 (Ne) 10004 [Light irradiation] case <Otaka>

The court stated the general proposition that a prior-use right is not established through so-called “encroachment.”

=First instance: Osaka District Court, 2017 (Wa) 7532

Because of the retroactive effect of correction, the invention relating to the prior use must fall within the technical scope of the corrected invention.

(14) [Patents] IP High Court, 2020 (Ne) 10004 [Light irradiation] case <Otaka>—The court stated the general proposition that a prior-use right is not established through “encroachment.” - YouTube

English translation of the figure

IP High Court, 2020 (Ne) 10004, “Light Irradiation” <Otaka>; first instance: Osaka District Court, 2017 (Wa) 7532.

A general proposition was stated that a prior-use right cannot arise by “encroachment” ⇒ prior-use right denied.

Patent Act Article 79: A person who, without knowing the content of the invention in the patent application, independently makes an invention … and, at the time of the patent application, … is conducting or preparing a business working that invention is entitled to a prior-use right.

(Excerpts from the judgment) (1) It is natural to interpret “that invention” in each instance as referring to “the invention in the patent application.” (2) In view of the fact that a prior-use right is a non-exclusive

license to the patented invention, the invention relating to prior use means one that is identical to, or at least part of, the patented invention.

⇒ The invention relating to prior use must fall within the technical scope of the patented invention. ⇒ Because correction has retroactive effect, it must fall within the technical scope of the corrected invention. Even if the invention relating to prior use fell within the technical scope before correction, that does not affect the conclusion.

Left, before correction: “Prior-used article 1” falls within the invention at issue ⇒ prior-use right permitted. Right, after correction (narrowing): “Prior-used article 1” does not fall within the invention at issue ⇒ prior-use right denied.

Diagram labels: patented invention at issue; prior-used article 2; accused product; prior-used article 1. Left diagram: × between prior-used article 2 and the accused product; ○ between the accused product and prior-used article 1. Right diagram: × on both of those connections.

[US Designs] 2019.09 CAFC Curver Luxembourg v. Home Expressions

In this case, the title, claim, and figure descriptions of the design patent were amended to refer to a pattern for a chair, limiting the scope of the patent. During prosecution, the title was amended to “Pattern for a Chair” and the claim to “ornamental design for a pattern for a chair.”

⇒ Home Expressions' basket did not infringe.

2015 CAFC INEOS USA v. Berry Plastics Inventions with numerical limitations and novelty

Original Ameblo publication: 2022-10-26

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12771268830.html

2015.04 CAFC INEOS USA v. Berry Plastics (Inventions with numerical limitations and novelty)

① The reference discloses a specific numerical value within the claimed numerical range.

⇒ No novelty.

② Where the reference discloses a numerical range rather than a specific value, it describes the claimed numerical range with sufficient specificity for a reasonable fact finder to conclude that there is no reasonable difference in how the invention operates over the claimed range and the range disclosed in the reference.

⇒ No novelty.

IP High Court (Grand Panel), 2020 (Ne) No. 10024 [Chair-type massage machine]

With respect to the portion for which the presumption under Article 102(2) of the Patent Act is rebutted:

⇒ Paragraph (3) applies where the patent owner could have granted a license.

Paragraph (3) does not apply to the portion for which the presumption is rebutted on the ground that the patented invention is implemented only in part of the infringing product.

Paragraph (3) applies to the portion for which the presumption is rebutted on the ground that the markets are not identical.

Tokyo High Court, 1997 (Gyo-Ke) 87 [False-twist processing method] case <Ito>

Original Ameblo publication: 2022-11-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12772413896.html

Tokyo High Court, 1997 (Gyo-Ke) 87 [False-twist processing method] case <Ito>

*A decision denying inventive step by reversing the primary and secondary references violates the binding effect of the judgment.

"Although it differs from the previous decision at issue in using Reference 1 as the primary reference, it is unlawful as contrary to the binding effect of the previous judgment at issue (Article 33(1) of the Administrative Case Litigation Act)."

Cf. Opposite to the IP High Court decision in 2012 (Gyo-Ke) 10328!!

(Excerpts from the judgment)

The previous judgment rescinded the previous decision at issue on the ground that a person skilled in the art could not be said to have readily conceived the claimed invention from Reference 2 and Reference 1, and that judgment became final and binding. As a result of its binding effect, the trial examiners making the present decision are not permitted to find and determine that, before the patent application, a person skilled in the art could have readily conceived the claimed invention from the same references used in the previous decision. This principle applies equally even if the reasons for the present decision, unlike the previous decision, use Reference 1 as the primary reference.…

Where there are two references, Reference A and Reference B, whether to use A or B as the primary reference is merely a question of the method of analysis when determining whether an invention involves an inventive step in relation to References A and B….

Accordingly, the finding and determination in the present decision that the claimed invention could have been readily conceived on the basis of References 1 and 2 uses the same references as the previous decision. Although it differs from the previous decision in using Reference 1 as the primary reference, it must be described as unlawful because it violates the binding effect of the previous judgment (Article 33(1) of the Administrative Case Litigation Act), and that illegality affects the conclusion of the present decision….

IP High Court, 2012 (Gyo-Ke) 10328 <Shibata> [Odor-neutralizing and liquid-absorbing waste bag]

Original Ameblo publication: 2022-11-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12772743586.html

IP High Court, 2012 (Gyo-Ke) 10328 <Shibata> [Odor-neutralizing and liquid-absorbing waste bag]

* In this case, the decision denying inventive step based on an interchange of the primary and secondary references was held not to violate the binding effect of the prior judgment.

"Because the decision, by changing the primary reference, is found to address a different subject of determination from the prior judgment, it cannot be said to violate the binding effect … of the prior judgment."

Cf. Opposite to the Tokyo High Court decision in 1997 (Gyo-Ke) 87

⇒ Although it did not violate the binding effect of the prior judgment, the decision was rescinded for an error in the obviousness determination concerning the differences.

(Excerpts from the judgment)

…The decision at issue … used as its primary reference the document presented in the first decision as Well-Known Example 2 relating to Difference 1, identified the presence or absence of an odor-neutralizing composition as the difference, and determined, principally from the matters described in Reference 2 (Well-Known Example 6 in the first decision), that the configuration relating to that difference would have been obvious. Accordingly, by changing the primary reference, the present decision is found to address a different subject of determination from the prior judgment, and cannot be said to violate its binding effect (Article 33(1) of the Administrative Case Litigation Act).

https://www.nakapat.gr.jp/ja/legal_updates_jp/%E3%80%90%E7%89%B9%E8%A8%B1%E2%98%85%E2%98%85%E3%80%91%E3%80%8C%E5%B0%8E%E9%9B%BB%E6%80%A7%E6%9D%90%E6%96%99%E3%81%AE%E8%A3%BD%E9%80%A0%E6%96%B9%E6%B3%95%E3%80%8D%E4%BA%8B%E4%BB%B6%EF%BC%8D%E2%91%A0/

Osaka District Court, 2019 (Wa) 9113 [Information communication unit] <Sugiura>

<Damages>

Consumption tax included

Foreign-exchange gains included

Concurrent application of paragraphs (2) and (3) does not apply to a deduction for competing products.

“The only … circumstance rebutting the presumption … under paragraph (2) … is competing products … not directly related to the sales performance of the defendant's products … there is no basis for applying paragraph (3).”

⇒ The appellate judgment in the IP High Court case 2021 (Ne) 10088 and other cases likewise held that paragraphs (2) and (3) do not apply concurrently to deductions for competing products.

(Excerpts from the judgment)

…Foreign-exchange gains are understood to arise in connection with settlement in foreign currency of purchases of each of the defendant's products. Accordingly, when calculating the amount of profit the defendant obtained from sales of those products, the calculated foreign-exchange gains against the exchange rate at the time of the import contract, arising from foreign-currency settlement of purchases during a certain period, should be assessed as part of cost together with the purchase price of each product, and should appropriately be included in calculating the defendant's profits.

With respect to concurrent application of Article 102(2) and (3) of the Patent Act, …the only circumstance to be considered as rebutting the presumption of the amount of damages under paragraph (2) is the existence of competing products. For the portion rebutted on the basis of such a circumstance, which is not directly related to the defendant's sales performance of each accused product, there is no basis for applying paragraph (3).

IP High Court, 2016 (Gyo-Ke) 10118 [High-efficiency propeller] <Shimizu> “Publication” under Article 29(1)(iii)

Original Ameblo publication: 2022-11-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12773925979.html

IP High Court, 2016 (Gyo-Ke) 10118 [High-efficiency propeller] <Shimizu>

“Publication” under Article 29(1)(iii)

*For an “invention described in a publication” under Article 29(1)(iii) of the Patent Act, it is sufficient that the invention is described to an extent that allows a person skilled in the art to recognize and implement it without special thought.

(Excerpts from the judgment)

…The plaintiff argues that, because the Figure 1 invention is merely a conventional example, the cited invention should be identified as the invention in Figure 3 and other figures.… The expression “an invention described in a publication distributed in Japan or a foreign country before the filing of the patent application” in Article 29(1) …(iii) of the Patent Act is understood to require only a description sufficient for a person skilled in the art encountering the distributed publication to recognize and implement the invention without special thought. Thus, where the publication is a published patent application, not only the patented invention that is the subject of the publication but also prior art described in that publication as a technical idea constitutes an “invention described in a publication” under that item if it is described sufficiently to permit recognition and implementation of the technology…. …The fact that the invention is described as “background art” in the cited document does not prevent the above finding.

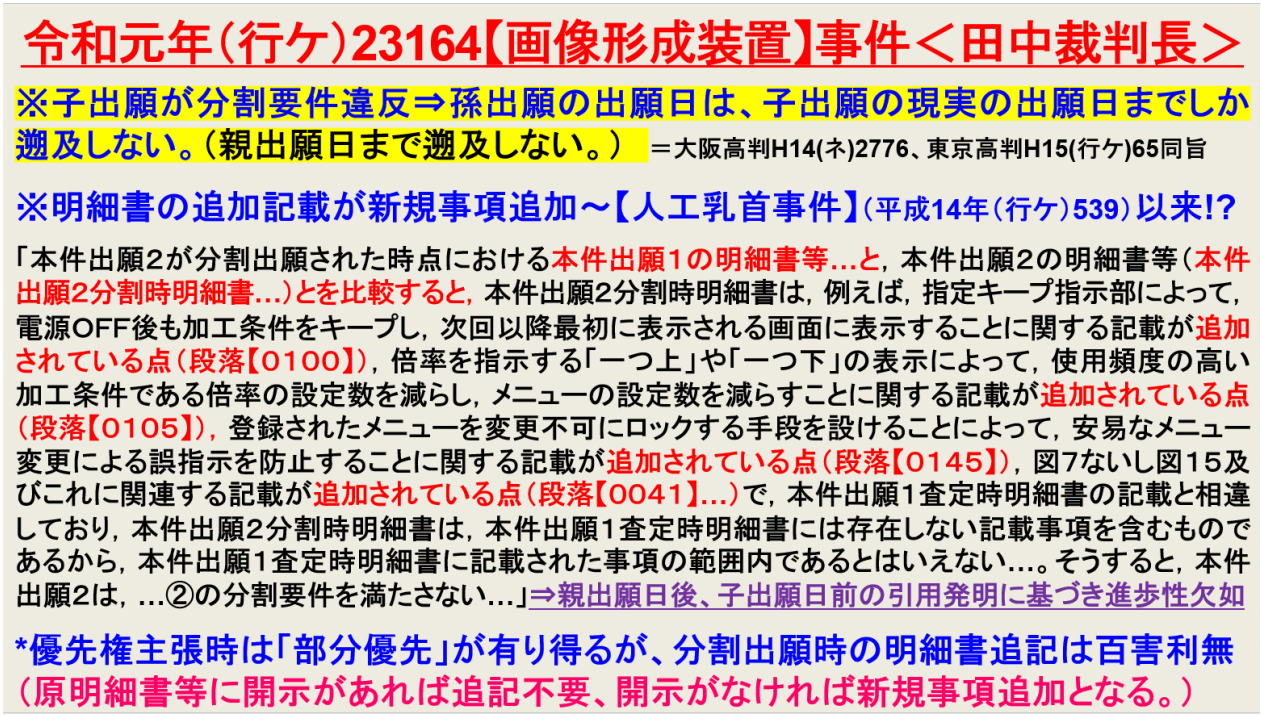
[Patents] Addition of new matter (parent, child, and grandchild applications)

Original Ameblo publication: 2022-11-12



Ameblo: https://ameblo.jp/hideki-takaishi/entry-12774170283.html

[Patents] Addition of new matter (parent, child, and grandchild applications)

If an amendment adds new matter to a child application, the retroactive effect of the amendment causes the child application to violate the divisional requirements.

⇒ “Partial priority” may be available when claiming priority, but adding text to the specification when filing a divisional application does nothing but harm. (If disclosed in the original specification and other documents, the addition is unnecessary; if not disclosed, it adds new matter.)

https://www.youtube.com/watch?v=jTjDl9d8dFI

English translation of the figure

Tokyo District Court, 2019 (Wa) 23164, “Image Forming Apparatus” <Presiding Judge Tanaka>.

If the child application violates the requirements for a divisional application, the filing date of the grandchild application goes back only to the actual filing date of the child application, not to the filing date of the parent application. Osaka High Court, 2002 (Ne) 2776, and Tokyo High Court, 2003 (Gyo-Ke) 65, are to the same effect.

Addition to the specification constitutes addition of new matter — since the “Artificial Nipple” case (2002 (Gyo-Ke) 539)!?

“Comparing the specification and other documents of Application 1 at issue … at the time Application 2 at issue was filed as a divisional application with the specification and other documents of Application 2 at issue (the specification of Application 2 at the time of division …), the latter differs from the specification of Application 1 at the time of the decision in that, for example: it adds a description concerning retention of processing conditions even after the power is switched off by means of a designated-keep instruction unit and displaying them on the screen first displayed on the next and subsequent occasions (paragraph [0100]);

it adds a description concerning reduction in the number of magnification settings, which are frequently used processing conditions, and in the number of menu settings by means of ‘one above’ or ‘one below’ instructions indicating magnification (paragraph [0105]); it adds a description concerning prevention of erroneous instructions resulting from easy changes to the menu by providing means for locking registered menus so that they cannot be changed (paragraph [0145]); and it adds Figures 7 to 15 and associated descriptions (paragraph [0041] …). Because the specification of Application 2 at the time of division includes matters not present in the specification of Application 1 at the time of the decision, it cannot be said to fall within the scope of the matters described in the latter. … Accordingly, Application 2 at issue does not satisfy divisional requirement (2). …” ⇒ Lack of novelty based on a cited invention that became public after the filing date of the parent application and before the filing date of the child application.

Although “partial priority” may be possible when claiming priority, additions to the specification when filing a divisional application bring harm and no benefit. If disclosed in the original specification and other documents, addition is unnecessary; if not disclosed, it constitutes addition of new matter.

(Note) The figure gives the case number as “2019 (Gyo-Ke) 23164” and the conclusion as “lack of inventive step.” The correct case number is 2019 (Wa) 23164, and the court found lack of novelty under Article 29(1)(iii) of the Patent Act (judgment, p. 32, lines 5–7).

Tokyo District Court, 2014 (Wa) 17797 [Compression-bonded herbaceous material] <Okinaka> Substantial quantities outside the numerical range ⇛ Claim limitation not satisfied

Original Ameblo publication: 2022-11-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12774588127.html

Tokyo District Court, 2014 (Wa) 17797 [Compression-bonded herbaceous material] <Okinaka>

*There is a numerical limitation requiring bulk specific gravity to be adjusted to the range of 0.15–0.25 or less, while the specification contains no statement permitting values outside that numerical range.

⇒ Adjustment must be made consistently within the above range.

⇒ If substantial quantities fall outside the numerical range, the limitation is not satisfied.

[Claim 1] …A loosened material obtained by … bonding pulverized lignin-rich herbaceous material whose bulk specific gravity has been adjusted to 0.15–0.25 or less to form a compression-bonded material, and then loosening the compression bond.

(Excerpts from the judgment)

⋯There is a numerical limitation requiring the bulk specific gravity of the pulverized herbaceous material to be adjusted to a range of 0.15–0.25 or less, but no statement is found indicating that the bulk specific gravity of some portion of the pulverized herbaceous material may fall outside that range. Accordingly, for the defendant's product to satisfy Claim Element B, it must at least be the case that the bulk specific gravity of the pulverized material in the defendant's product is adjusted consistently within that range. If the bulk specific gravity is unstable and substantial quantities of the pulverized material fall outside that range, it cannot be said that its bulk specific gravity has been adjusted to that range, and Claim Element B cannot be found satisfied.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-85655.pdf

IP High Court, 2021 (Gyo-Ke) 10111 [Laser processing apparatus] <Kanno> Correction to a negative limitation ⇒ Inventive step satisfied

Original Ameblo publication: 2022-11-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12774757781.html

IP High Court, 2021 (Gyo-Ke) 10111 [Laser Processing Apparatus] <Kanno>

The absence of grooves was discerned from the specification's drawings, and correction to a negative limitation was allowed. Because grooves are essential to the cited invention, there is a teaching away.

⇒ Inventive step affirmed.

My impression is that amendments adding negative limitations to avoid Article 29-2 (conflict with an earlier-filed, later-published application) are often passed over as not introducing new technical matter.

On the other hand, my impression is that amendments adding negative limitations to overcome inventive-step objections receive a thorough examination of the disclosure in the specification.

⇒ Both should be issues of added new matter under the “Solder Resist IP High Court Grand Panel judgment,” but I sense a difference.

⇒ The Japanese Examination Guidelines, US MPEP, and the Guidelines for Examination in the EPO also distinguish between them. …But there appears to be no legal basis for this distinction.

(Excerpts from the judgment)

<Addition of new matter>

Correction 1 merely excludes from the invention of claim 1 before correction the conceptually encompassed “silicon wafer in which a groove along said planned cutting line is formed in the silicon single-crystal structure portion,” or a groove-essential apparatus. Thus, Correction 1, whose purpose is to narrow the scope of the claims, does not add a new technical matter to the “laser processing apparatus” of the invention of claim 1. Even in light of the description, ... Figures 1 and 3 are plan views depicting planned cutting lines on workpiece 1, while neither Figure 2, a cross-sectional view along line II–II in Figure 1, nor Figure 4, a cross-sectional view along line IV–IV in Figure 3, shows a groove being formed. ... In Figures 1 through 4, “planned cutting lines” are depicted but “grooves” are not. If the invention before correction presupposed the presence of “grooves,” it would be unnatural to depict “planned cutting lines” yet deliberately omit “grooves.”

<Inventive step>

It is inconceivable that a person skilled in the art encountering Exhibit Ko 11 would disregard, from substrate 201, groove 203, which provides the internal stress used to cut the semiconductor wafer. Not only is there no motivation to adopt, as the object to be processed, a substrate 201 without grooves along the break lines and modify it to form a processing-modified portion inside substrate 201 whose surface has no grooves, but rather there is a teaching away from such a modification….

Tokyo District Court, 2019 (Wa) 33246 [(Sequel) case] <Kokubu> ⇛ Pursuing the earlier infringement action was not a tort.

Original Ameblo publication: 2022-11-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12774916332.html

Tokyo District Court, 2019 (Wa) 33246 [(Sequel) case] <Kokubu>

It is not unnatural that the party may not have recognized the existence of a “gap” in its own past products.

⇒ Pursuing the earlier infringement action was not a tort.

<Earlier action>

Tokyo District Court, 2017 (Wa) 17791 (=IP High Court, 2018 (Ne) 10088)

⇒ Public working through its own past products

“…After the heat-staking horn of the heat-staking machine is lowered and crushes the heat-staking protrusion from above, when the horn reverses and rises, the heat-staking protrusion springs back slightly due to stress, which is thought to create a gap in the direction of the shaft's rotational axis (Exhibit Otsu 13). In the plaintiff's water-flow experiment, although No-Gap 1 through No-Gap 5 were manufactured to have as little gap as possible, gaps as described above arose. This can be said to show that creation of a gap in the direction of the shaft's rotational axis is unavoidable during heat staking with the plaintiff's heat-staking machine.”

My posts were mentioned in “Sotoku Diary.”

Original Ameblo publication: 2022-11-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12775073927.html

My posts were mentioned in “Sotoku Diary.”

“[Claim 1] A product having Configuration A (which may or may not produce Effect X).

[Claim 2] A product having Configuration A and producing Effect X.

Whereas Claim 1 includes both ‘products producing Effect X’ and ‘products not producing Effect X,’ Claim 2 excludes ‘products not producing Effect X.’ Since Claim 2 therefore does not require support for ‘products not producing Effect X,’ can it be said that the support requirement is easier to satisfy for Claim 2 than for Claim 1?”

My view is as follows.

The support requirement depends on the problem addressed by the invention.

⇒ If the invention's problem is to provide A (a new substance), the ease of satisfying the support requirement is considered the same for Claims 1 and 2.

However, if the invention's problem is Effect X, I consider the support requirement easier to satisfy for Claim 2 than for Claim 1, at least comparatively.

⇒ Taking into account that the invention's problem itself may become an issue in litigation, I consider Claim 2 useful in practice.

IP High Court, 2020 (Ne) 10004 <Otaka> [Light irradiation apparatus] =Osaka District Court, 2017 (Wa) 7532 <Sugiura>

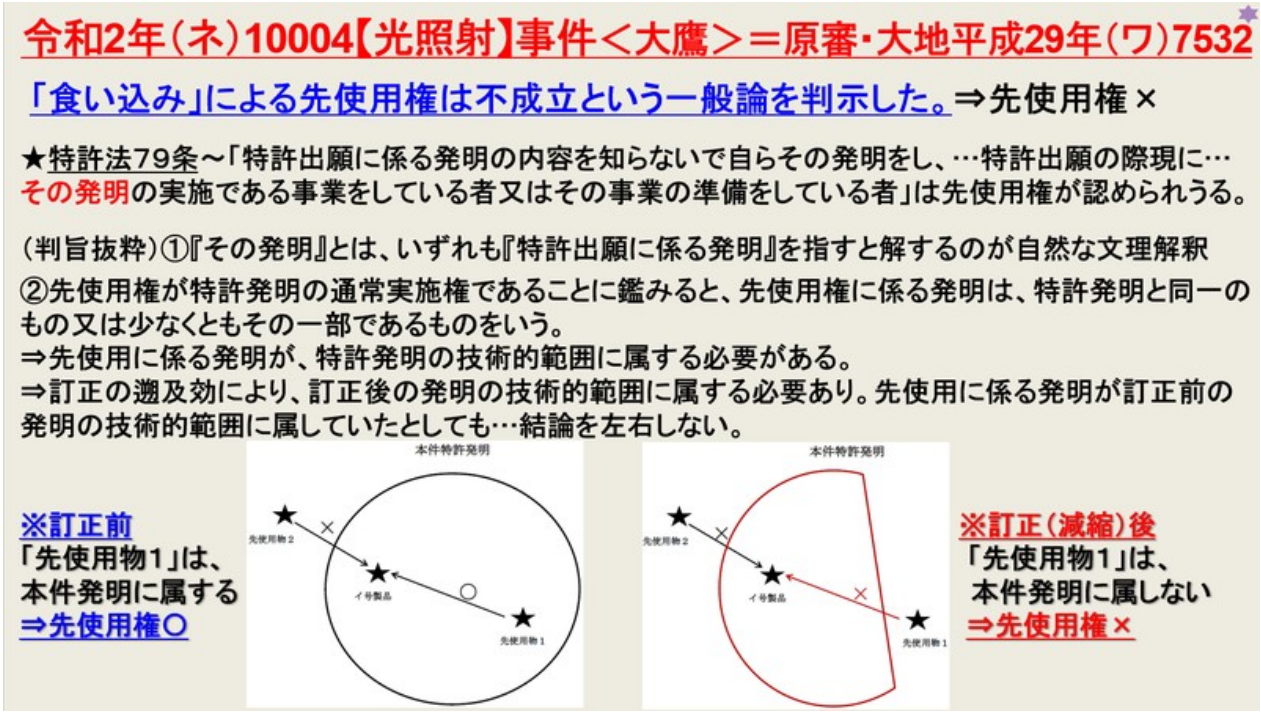
Original Ameblo publication: 2022-11-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12775074275.html

IP High Court, 2020 (Ne) 10004 <Otaka> [Light irradiation apparatus]

The product lineup (2004– Comprehensive LED Lighting Catalog), including publicly worked products, was used as a reason to reject obviousness. A prior-use right through “encroachment” was not established.

⇒ A prior-use right is not established where the prior-use invention falls outside the scope of the post-correction invention, even if it fell within the scope of the pre-correction invention.



=Osaka District Court, 2017 (Wa) 7532 <Sugiura>

*Inventive step was found even using the publicly worked invention = prior-use invention as a reference.

(Excerpts from the judgment)

As an exception to the first-to-file principle (Article 39(1)), the Patent Act recognizes a statutory non-exclusive license based on prior use (prior-use right) where the requirements of Article 79 are met. The person entitled to a prior-use right is defined as “a person who, without knowing the contents of the invention pertaining to a patent application, independently made that invention … and, at the time of filing the patent application, is actually engaged in business implementing that invention in Japan or preparing for such business.” The natural textual interpretation is that “that invention” in each instance refers to “the invention pertaining to the patent application.” In addition, given that a prior-use right is, as stated above, a non-exclusive license of the patented invention, the invention covered by the prior-use right is understood to mean one identical to the patented invention or at least a part of it. Accordingly, establishment of a prior-use right requires the prior-use invention to fall within the technical scope of the patented invention.… Once the decision concerning the re-correction at issue became final and binding, the patent application, registration of the patent right, and other acts concerning the patent are deemed to have been made on the basis of the claims after that re-correction (Article 128 of the Patent Act). …Even if the invention fell within the technical scope of the corrected invention at issue …, this does not alter the conclusion. Furthermore, even with this interpretation, correction means that the patentee's rights are recognized only within the technical scope of the patented invention based on the post-correction claims. This interpretation therefore cannot be said to conflict with the purpose of the prior-use-right system, which seeks fairness between the patentee and a person who had previously worked the patented invention.

089805_hanrei.pdf (courts.go.jp)

English translation of the figure

IP High Court, 2020 (Ne) 10004, “Light Irradiation” <Otaka>; first instance: Osaka District Court, 2017 (Wa) 7532.

A general proposition was stated that a prior-use right cannot arise by “encroachment” ⇒ prior-use right denied.

Patent Act Article 79: A person who, without knowing the content of the invention in the patent application, independently makes an invention … and, at the time of the patent application, … is conducting or preparing a business working that invention is entitled to a prior-use right.

(Excerpts from the judgment) (1) It is natural to interpret “that invention” in each instance as referring to “the invention in the patent application.” (2) In view of the fact that a prior-use right is a non-exclusive license to the patented invention, the invention relating to prior use means one that is identical to, or at least part of, the patented invention.

⇒ The invention relating to prior use must fall within the technical scope of the patented invention. ⇒ Because correction has retroactive effect, it must fall within the technical scope of the corrected invention. Even if the invention relating to prior use fell within the technical scope before correction, that does not affect the conclusion.

Left, before correction: “Prior-used article 1” falls within the invention at issue ⇒ prior-use right permitted. Right, after correction (narrowing): “Prior-used article 1” does not fall within the invention at issue ⇒ prior-use right denied.

Diagram labels: patented invention at issue; prior-used article 2; accused product; prior-used article 1. Left diagram: × between prior-used article 2 and the accused product; ○ between the accused product and prior-used article 1. Right diagram: × on both of those connections.

IP High Court, 2014 (Gyo-Ke) 10059 Ishii Package containing a dry liposomal pharmaceutical composition containing an iodophor

Original Ameblo publication: 2022-11-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12775556560.html

IP High Court, 2014 (Gyo-Ke) 10059 [Package containing a dry liposomal pharmaceutical composition containing an iodophor] <Ishii>

*The configuration was obvious.

⇒ Adopting the claimed invention's configuration relating to Difference (A) automatically achieves the claimed effect (“storage stability”) as well.

⇒ Inventive step denied.

[Claim 1] …A storage-stable package containing a dry liposomal pharmaceutical composition containing an iodophor.

(Excerpts from the judgment)

…The decision erred … in determining that Difference (B) was not a substantive difference on the ground that the iodophor-containing dry liposomal pharmaceutical composition in the Reference 1 invention satisfies “storage-stable” in the claimed invention regardless of the material of the storage container…. …

However, …a person skilled in the art could readily have conceived of adopting, in the Reference 1 invention, the claimed invention's configuration relating to Difference (A), and the configuration relating to Difference (B) is achieved simultaneously. It can therefore be said that a person skilled in the art could also readily have adopted the configuration relating to Difference (B) in the Reference 1 invention. Accordingly, the claimed invention should be considered one that a person skilled in the art could readily have conceived on the basis of the inventions described in References 1 and 2, and …the above error in the decision does not affect its conclusion.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-84708.pdf

Tokyo District Court, 2020 (Wa) 8506 […Work gloves] <Sato>

Original Ameblo publication: 2022-11-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12775556998.html

Tokyo District Court, 2020 (Wa) 8506 […Work gloves] <Sato>

"The plaintiff … argues that the 'irregularities' must have been intentionally formed, and that the irregularities in question are merely 'surface roughness' inevitably arising during manufacture. However, …on the surface of the Exhibit Otsu 1 gloves …the irregularities cannot be said to have arisen inevitably during manufacture, but were intentionally formed."

⇒ Does public working require intentional formation?

Even exclusive sales constitute "disclosure to a third party" and thus public working. (*No evidence establishing a confidentiality agreement.)

The irregularities on the surface of the publicly worked product were intentionally formed.

Other points not limited by the claim language are not differences.

Defendant Yotsugi sold the product to Tohoku Electric Power and transferred ownership, and there is insufficient evidence to find that Tohoku Electric Power … was obliged not to disclose it to third parties.

…Because the Exhibit Otsu 1 product was used by Tohoku Electric Power's on-site workers, the contents of the Exhibit Otsu 1 invention had been disclosed to third parties….

Tokyo District Court, 2018 (Wa) 1130 [Printed retroreflective sheeting] <Tanaka> Damages

Original Ameblo publication: 2022-11-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12775717187.html

Tokyo District Court, 2018 (Wa) 1130 [Printed retroreflective sheeting] <Tanaka>

Before filing this action, the plaintiff proposed 5% to the 3M group, including the defendants.

…

Defendant 3M Japan and the other parties asserted 10% in the patent-infringement action they brought against the plaintiff.

…

The royalty rate to be determined after the fact is 10%.

⇒ ¥1.5 billion awarded

(Excerpts from the judgment)

It is found that, before filing this action, the plaintiff proposed a 5% royalty rate for the patent at issue to the 3M group, including the defendants …; meanwhile, US 3M had asserted in a previous patent-infringement action against a third party that the royalty rate for a patent concerning retroreflective sheeting was 9% …; US 3M and the other parties had agreed to a royalty rate of 20% in a previous action against a third party …; and …defendant 3M Japan and the other parties asserted a 10% royalty rate in a patent-infringement action they brought against the plaintiff.…

The royalty rate receivable for the working at issue, to be determined after the fact for the defendants who infringed the patent at issue, is not less than 10%….

IP High Court, 2021 (Ne) 10088 and other cases [Information communication unit]—No concurrent application of paragraphs (2) and (3) to deductions for competing products

Original Ameblo publication: 2022-11-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12776051541.html

On appeal, the IP High Court likewise held in 2021 (Ne) 10088 and other cases [Information communication unit] <Kanno> that paragraphs (2) and (3) do not apply concurrently to deductions for competing products (the same as the first-instance judgment).

First instance: Osaka District Court, 2019 (Wa) 9113

“Foreign-exchange gains … should be assessed as cost together with the purchase price and included in calculating the defendant's profits.”

(Excerpt from the judgment / First instance: Osaka District Court, 2019 (Wa) 9113)

…Foreign-exchange gains are understood to arise in connection with settlement in foreign currency of purchases of each of the defendant's products. Accordingly, when calculating the amount of profit the defendant obtained from sales of those products, the calculated foreign-exchange gains against the exchange rate at the time of the import contract, arising from foreign-currency settlement of purchases during a certain period, should be assessed as part of cost together with the purchase price of each product, and should appropriately be included in calculating the defendant's profits.

With respect to concurrent application of Article 102(2) and (3) of the Patent Act, …the only circumstance to be considered as rebutting the presumption of the amount of damages under paragraph (2) is the existence of competing products. For the portion rebutted on the basis of such a circumstance, which is not directly related to the defendant's sales performance of each accused product, there is no basis for applying paragraph (3).

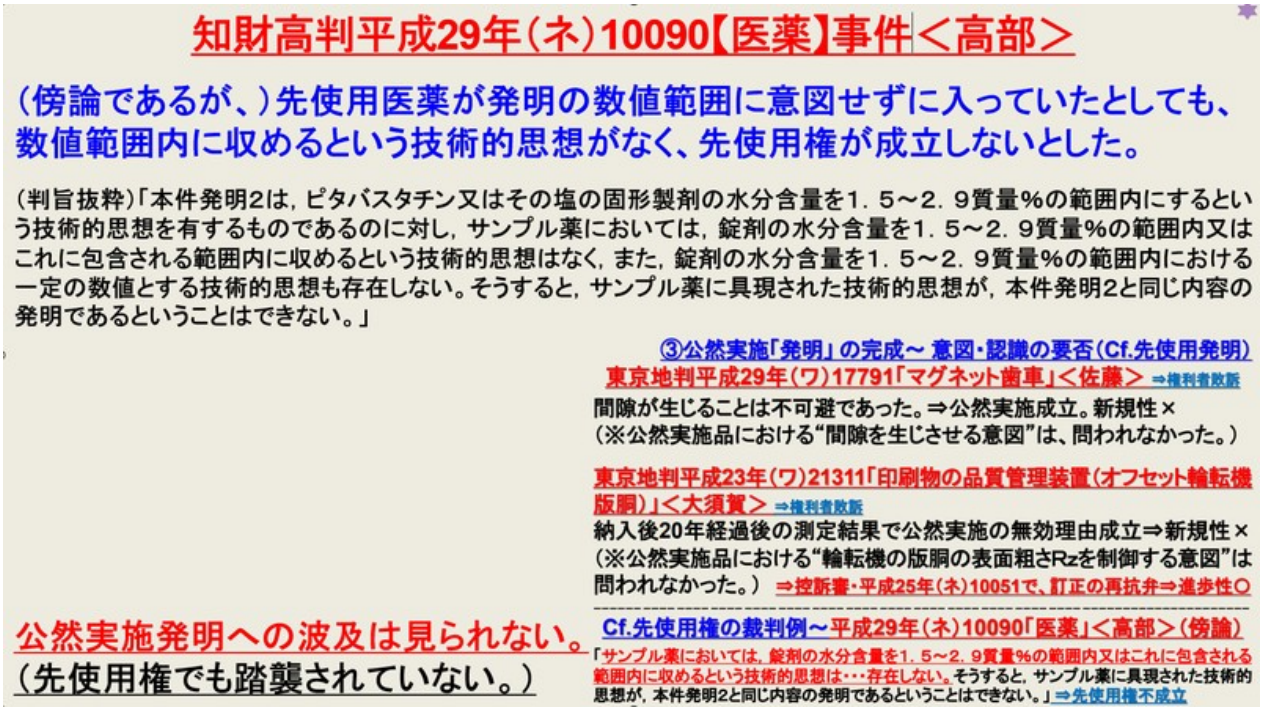
IP High Court, 2017 (Ne) 10090 [Pharmaceutical] case <Takabe>

Original Ameblo publication: 2022-11-24



Ameblo: https://ameblo.jp/hideki-takaishi/entry-12776051865.html

IP High Court, 2017 (Ne) 10090 [Pharmaceutical] case <Takabe>

(Although obiter dictum,) the court held that, even if the prior-use pharmaceutical unintentionally fell within the invention's numerical range, there was no technical idea of bringing it within that range, and no prior-use right was established.

⇒ In the second action (claim for damages), the support requirement failed at first instance and inventive step failed on appeal.

https://www.youtube.com/watch?v=pyijXtGm9so

English translation of the figure

IP High Court, 2017 (Ne) 10090, "Pharmaceutical" <Takabe>.

(Although obiter dictum,) the court held that, even if the prior-used pharmaceutical unintentionally fell within the numerical range of the invention, there was no technical concept of keeping it within that numerical range, and a prior-use right was not established.

(Excerpt from the judgment) "Invention 2 at issue has the technical concept of setting the water content of a solid preparation of pitavastatin or a salt thereof within the range of 1.5–2.9% by mass. In contrast, the sample drugs have neither the technical concept of keeping the water content of the tablets within the range of 1.5–2.9% by mass or a range included therein, nor the technical concept of setting their water content at a particular value within the range of 1.5–2.9% by mass. Accordingly, the technical concept embodied in the sample drugs cannot be said to be an invention having the same content as Invention 2 at issue."

No extension to publicly worked inventions is seen. (It was not protected even as prior use.)

3. Completion of a publicly worked "invention" — whether intention or recognition is necessary (cf. prior-used inventions). Tokyo District Court, 2017 (Wa) 17791, "Magnetic Gear" <Sato> ⇒ patentee lost.

Formation of a gap was inevitable ⇒ public working established; no novelty. (An “intention to create a gap” in the publicly worked product was not required.)

Tokyo District Court, 2011 (Wa) 21311, “Printed-Matter Quality Management Apparatus (Offset Rotary Press Plate Cylinder)” <Osuga> ⇒ patentee lost. An invalidity ground based on public working was established through measurements taken 20 years after delivery ⇒ no novelty. (An “intention to control the surface roughness Rz of the rotary press plate cylinder” in the publicly worked product was not required.) ⇒ On appeal, 2013 (Ne) 10051, rebuttal based on correction ⇒ inventive step recognized.

Cf. prior-use-right judgment: 2017 (Ne) 10090, “Pharmaceutical” <Takabe> (obiter dictum). “In the sample drugs, the technical concept of keeping the water content of the tablets within the range of 1.5–2.9% by mass or a range included therein … does not exist. Accordingly, the technical concept embodied in the sample drugs cannot be said to be an invention having the same content as Invention 2 at issue.” ⇒ Prior-use right not established.

Tokyo District Court, 2020 (Wa) 13326, 13331 [Forearm-fracture inhibitor containing eldecalcitol] <Shibata>

Original Ameblo publication: 2022-11-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12776211867.html

2020 (Wa) 13326, 13331 [Forearm-fracture inhibitor containing eldecalcitol] <Shibata>

Lack of novelty of a use invention

“The configuration for use in preventing fractures of the radius should be regarded as identical to the invention described in Exhibit Otsu 1 and lacks novelty.”

⇒ A meaningful precedent for situations under Article 29-2

(Excerpts from the judgment)

Regarding the limitation of the subjects of administration to patients with Type I osteoporosis, at the priority date at issue, it had been proposed to classify as Type I osteoporosis the osteoporosis occurring in women during the first 15–20 years after menopause, characterized by an excessive and disproportionate phenomenon in cancellous bone compared with cortical bone…. It is clear that Type I osteoporosis as thus proposed is a type of osteoporosis. On the other hand, the specification contains no description whatsoever of effects or the like arising from distinguishing patients with Type I osteoporosis from the osteoporosis patients targeted by the Exhibit Otsu 1 invention as subjects of administration. Accordingly, limiting the subjects of administration to Type I osteoporosis patients should be assessed as a use contemplated by the Exhibit Otsu 1 invention, and cannot be said to constitute a difference from that invention.

IP High Court, 2020 (Ne) 10048 <Tsuruoka> ⇛ A case denying a claim for employee-invention remuneration for know-how

Original Ameblo publication: 2022-11-26

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12776425364.html

IP High Court, 2020 (Ne) 10048 <Tsuruoka>

First instance: Tokyo District Court, 2018 (Wa) 36424

⇒ A case denying a claim for employee-invention remuneration for know-how

*Patentability of the know-how was denied.

⇒ Conversely, if know-how is patentable, a claim for employee-invention remuneration may be allowed!!

(Excerpts from the judgment)

…The appellant also argues that the know-how at issue is groundbreaking in combining a main game with a payout rate of 90% and a subgame with a payout rate of 100%, thereby balancing the interests of the game arcade and its customers. However, the question of what payout rate to set is not, in itself, a technical question but merely a matter of arrangement. Thus, the point advanced by the appellant does not constitute a circumstance supporting the patentability of the know-how at issue.

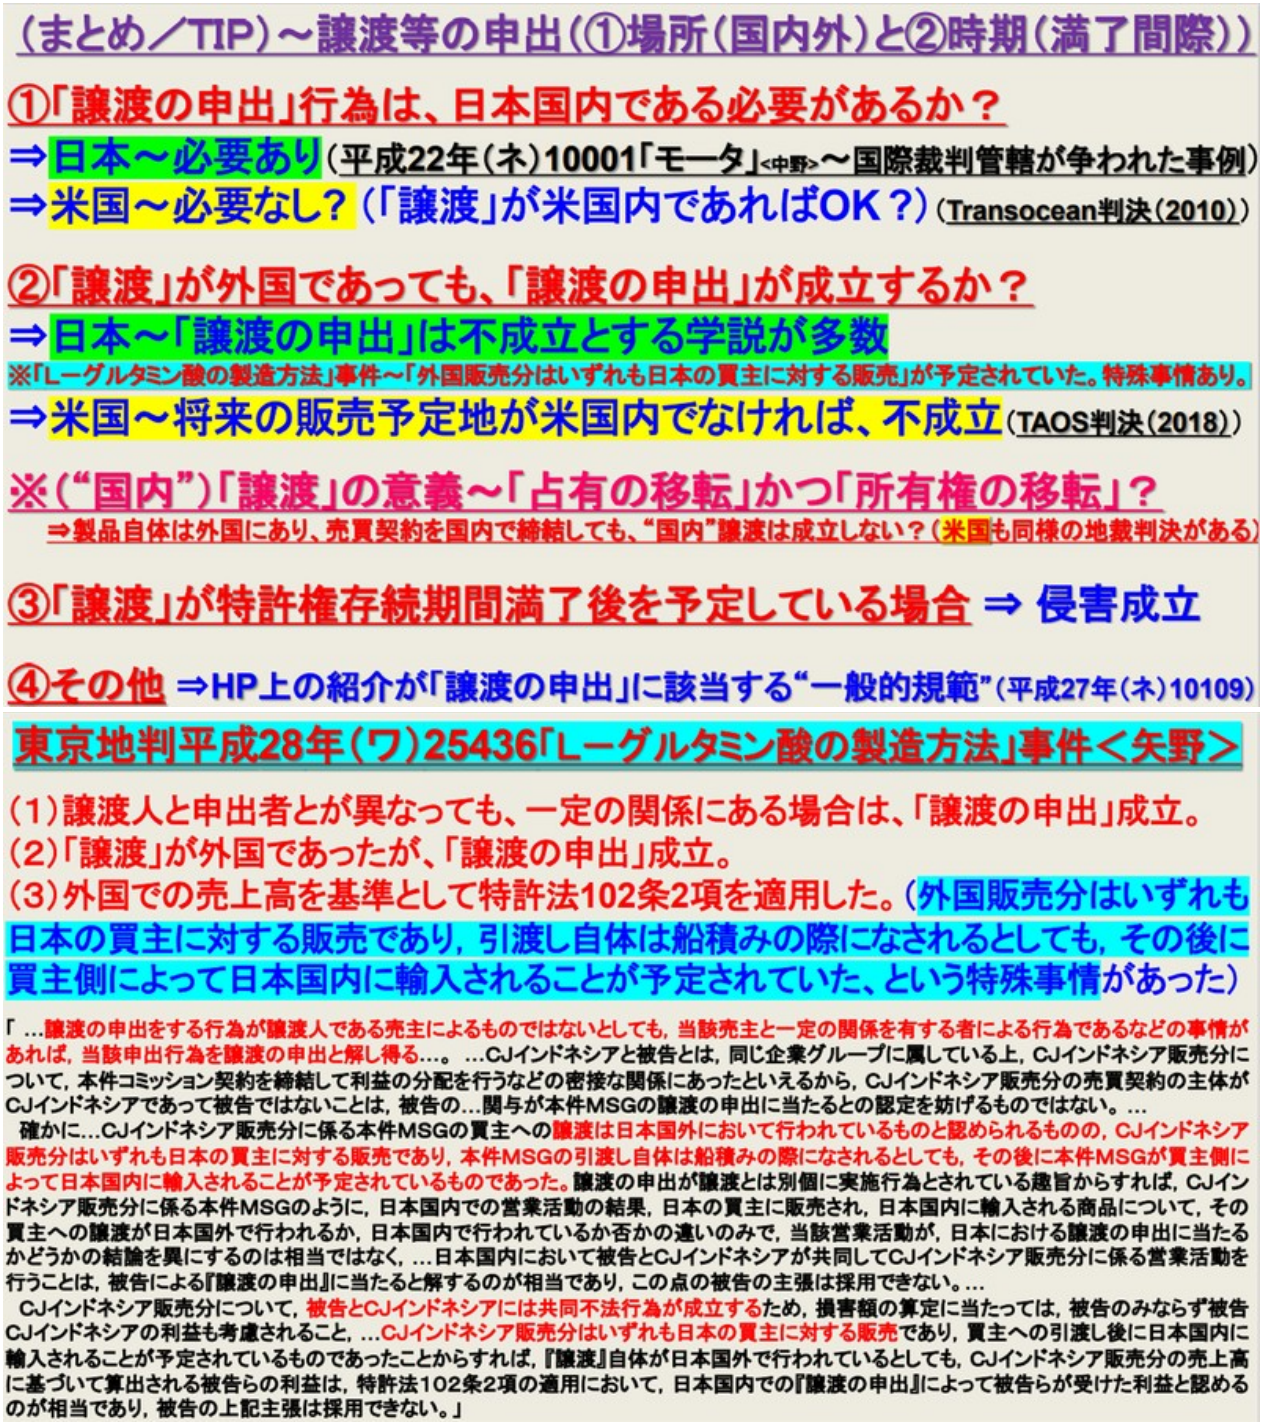
[Patents] Offer for assignment: Tokyo District Court, 2016 (Wa) 25436 [Method for producing L-glutamic acid] <Yamada>

Original Ameblo publication: 2022-11-26

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12776425643.html

(YouTube) [Patents] Offer for assignment



Tokyo District Court, 2016 (Wa) 25436 [Method for producing L-glutamic acid] <Yamada>

1. Even where the transferor and the offeror differ, an “offer for assignment” is established if they have a certain relationship.

2. An “offer for assignment” was established even though the “assignment” took place abroad.

3. Article 102(2) of the Patent Act was applied on the basis of overseas sales.

https://www.youtube.com/watch?v=2U8_ddBQLNI&feature=youtu.be

English translation of the first figure

(Summary/TIP) Offers for assignment and similar acts: (1) location (domestic or overseas) and (2) timing (immediately before expiration).

1. Must the act of “offering for assignment” take place within Japan? Japan — yes: 2010 (Ne) 10001, “Motor” <Nakano>, a case in which international jurisdiction was disputed. United States — not necessary? (Is it sufficient if the “sale” is within the United States?) (Transocean, 2010.)

2. Can an “offer for assignment” be established even if the “assignment” is overseas? Japan — many academic views take the position that an “offer for assignment” is not established. The “Method for Producing L-Glutamic Acid” case involved special circumstances: all overseas sales were intended to be sales to Japanese purchasers. United States — not established unless the anticipated location of the future sale is within the United States (TAOS, 2018).

Meaning of “assignment” (“domestically”): “transfer of possession” and “transfer of ownership”? ⇒ If the product itself is overseas, is a “domestic” assignment not established even if the sales contract is concluded domestically? (There is a US district court judgment to the same effect.)

3. Where “assignment” is scheduled to occur after expiration of the patent term ⇒ infringement established.

4. Other: a “general standard” under which introduction on a website constitutes an “offer for assignment” (2015 (Ne) 10109).

English translation of the second figure

Tokyo District Court, 2016 (Wa) 25436, “Method for Producing L-Glutamic Acid” <Yamada>.

(1) Even if the assignor and the person making the offer differ, an “offer for assignment” is established where they have a certain relationship. (2) An “offer for assignment” was established although the “assignment” was overseas. (3) Article 102(2) of the Patent Act was applied using overseas sales as the basis. (There were special circumstances: all overseas sales were to Japanese purchasers, and even if delivery itself occurred at shipment, subsequent importation into Japan by the purchaser was planned.)

“… Even if the act of making an offer for assignment is not performed by the seller who is the assignor, if there are circumstances such as performance by a person having a certain relationship with that seller, that act may be interpreted as an offer for assignment. … CJ Indonesia and the defendant belonged to the same corporate group and had a close relationship, including entering into the commission agreement at issue and distributing profits in relation to the CJ Indonesia sales. Therefore, the fact that the party to the sales contracts for the CJ Indonesia sales was CJ Indonesia rather than the defendant does not preclude a finding that the defendant’s … involvement constitutes an offer for assignment of the MSG at issue. …

Certainly, … although the assignment to the purchasers of the MSG at issue relating to the CJ Indonesia sales is found to have occurred outside Japan, all the CJ Indonesia sales were to Japanese purchasers, and even if delivery of the MSG at issue itself occurred at shipment, the MSG at issue was intended subsequently to be imported into Japan by the purchasers. In light of the purpose of treating an offer for assignment as an act of working separate from assignment itself, for products such as the MSG at issue relating to the CJ Indonesia sales, which are sold to Japanese purchasers and imported into Japan as a result of business activities in Japan, it would not be appropriate to reach different conclusions as to whether those business activities constitute an offer for assignment in Japan solely because assignment to the purchasers occurs outside rather than within Japan. … It is appropriate to interpret the defendant’s and CJ Indonesia’s joint conduct in Japan of business activities relating to the CJ Indonesia sales as an “offer for assignment” by the defendant; the defendant’s argument on this point cannot be accepted. …

Since the defendant and CJ Indonesia are joint tortfeasors with respect to the CJ Indonesia sales, the profits not only of the defendant but also of CJ Indonesia should be taken into account in calculating damages. … All the CJ Indonesia sales were to Japanese purchasers, and importation into Japan after delivery to the purchasers was planned. Therefore, even if the “assignment” itself occurred outside Japan, it is appropriate, in applying Article 102(2) of the Patent Act, to regard the profits of the defendant and CJ Indonesia calculated from sales of the CJ Indonesia sales as profits received by them through the domestic “offer for assignment.” The defendant’s above argument cannot be accepted.”

(Note) The figure gives the presiding judge as <Yano>. The presiding judge in this case was Judge Mami Yamada (judgment, p. 243, lines 5–6).

IP High Court, 2010 (Ne) 10001 [Motor] <Nakano> *International jurisdiction

Original Ameblo publication: 2022-11-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12776704886.html

IP High Court, 2010 (Ne) 10001 [Motor] <Nakano>

*International jurisdiction

With respect to an “act of offering for assignment,” whether Japan has international jurisdiction is determined by whether, as an objective matter of fact, the act of transmitting the offer or the result of its receipt occurred within Japan.

⇒ The defendant was found to have conducted sales activities in Japan.

(Excerpts from the judgment)

…In applying Article 5(ix) of the Code of Civil Procedure, which is considered when determining the existence of international jurisdiction, the place having jurisdiction over an action relating to a tort is the “place where the tort occurred.” This “place where the tort occurred” is understood to include both the place where the harmful act was committed (“place of the harmful act”) and the place where the result occurred (“place of the result”). Because the right the appellant (plaintiff at first instance) alleges was infringed in this action is Japanese Patent No. 3688015, it is appropriate to understand that, with respect to the appellee's (defendant at first instance) “act of offering for assignment,” which the appellant alleges constitutes a tort, whether Japan has international jurisdiction is determined by whether, as an objective matter of fact, the act of transmitting the offer or the result of its receipt occurred within Japan.…

The appellee operates an English-language website that lists one of the accused products and lists “Japan” under “Sales Inquiry,” with the address, telephone number, and fax number of its Japanese base (Minato-ku, Tokyo) under “Sales Headquarter”; its Japanese-language website also contains a webpage introducing the “Slim ODD Motor,” and selecting the “Inquiries concerning purchase” item on that page allows a user to prepare an inquiry form concerning sales of the “Slim ODD Motor”; the appellant's sales manager states in a written statement that the appellee's sales representatives conduct sales activities in Japan concerning ODD motors and that the accused products are being evaluated at … for incorporation into products (ODDs); A, a management adviser to the appellee, prepares and uses business cards bearing that title, the appellee's company name, and an address in Minato-ku, Tokyo, in Japanese; and there is a strong possibility that a DVD multi-drive incorporating one of the accused products is manufactured and sold by a domestic manufacturer and distributed domestically. Assessing these circumstances comprehensively, it is appropriate to find that, with respect to the act of offering the accused products for assignment that the appellant alleges constitutes a tort, the appellee's act of transmitting the offer or the result of its receipt occurred in Japan.…

Tokyo High Court, 2001 (Gyo-Ke) 489 [Spring structure] <Tsukahara> *No patentability even if a previously known product happens to fall within the numerical range.

Original Ameblo publication: 2022-11-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12777050238.html

Tokyo High Court, 2001 (Gyo-Ke) 489 [Spring structure] <Tsukahara>

*No patentability even if a previously known product happens to fall within the numerical range.

Even if the concept D/h had not attracted attention in previously known spring structures … it is entirely possible to discover that they happen to fall within that numerical range ... this would amount to granting a patent on the previously known spring structure itself … improper …

(Excerpts from the judgment)

…Even if nobody had focused on D/h before the application, and the concept D/h had not attracted attention in previously known spring structures, its constituent elements D (diameter of the rubber plates) and h (total thickness of the rubber plates) themselves naturally existed in a state in which they could be known. Thus, if it is discovered that spring structures whose ratio D/h lies within a particular numerical range have superior performance, it is entirely possible that calculating the D/h of a previously known spring structure will reveal that it happens to lie within that range. In such a case, granting a patent on spring structures whose D/h lies within a particular numerical range would amount to granting a patent on the previously known spring structure itself, and it is clear that this would be improper.

Tokyo High Court, 2001 (Ne) 2630 […Reinforcing rod] <Shinohara> Equivalent substantially identical to an earlier-filed, later-published application

Original Ameblo publication: 2022-12-06

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12777995151.html

Tokyo High Court, 2001 (Ne) 2630 […Reinforcing rod] <Shinohara>

Equivalent substantially identical to an earlier-filed, later-published application

⇒ Fourth requirement not satisfied

"Requirement ④′ … is based on the view that something for which nobody should have been able to obtain utility model registration cannot be regarded as falling within the technical scope of the registered utility model."

⇒ Utility model right holder loses on reversal

⇒ What about other patentability requirements?

(Even if the equivalent is a support-requirement issue, is it acceptable to find equivalence? …I cannot even find discussion of this point.)

(Excerpts from the judgment)

⋯Regarding requirement ④′ (not being publicly known technology), the appellant argues that the thinking underlying the above Supreme Court judgment is that expansion of the technical scope of a registered utility model through the doctrine of equivalents is impermissible if it results in including a ground for invalidity of that utility model registration; that, if a configuration in which the upper end of the reinforcing rod is attached to the side rod of the platform frame is equivalent to one in which it is attached to the rear rod, the device at issue, with its technical scope thus expanded, would be identical to the device described in the earlier application's specification and would include a ground for invalidity under the main text of Article 3-2 of the Utility Model Act; and that the appellee's assertion of equivalence therefore cannot stand.

Considering the appellant's argument, as stated above, requirement ④′ is based on the view that something for which nobody should have been able to obtain utility model registration in the first place cannot be regarded as falling within the technical scope of a registered utility model. Where a registered utility model is identical to a device described in the specification or drawings originally attached to another utility model application filed before its filing date and published after its filing, the main text of Article 3-2 of the Utility Model Act likewise means that nobody should have been able to obtain utility model registration for that device. In such a case, as with the circumstances specified in requirement ④′, it is inappropriate to treat the device as falling within the technical scope of the registered utility model.

Accordingly, where the accused product is identical to a device described in the specification or drawings of an earlier application for the registered utility model as provided in the main text of Article 3-2 of the Utility Model Act, it should be treated analogously to publicly known technology at the time of filing. It cannot be construed as falling within the technical scope of the registered utility model as an equivalent of the configuration recited in its claims.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12778317333.html

IP High Court, 2019 (Gyo-Ke) 10132 <Tsuruoka>

[Brunnian link-making device and kit]

① Partial priority

(Note) Where a new configuration added in the later application is not included in the priority application, priority is denied for that component. However, that fact alone does not render the patent invalid; the component must be found to lack novelty or inventive step in light of the cited invention.

② Deleting a feature not essential to solving the problem does not add new matter.

⇒ Amendment requirements satisfied

=IP High Court, 2014 (Gyo-Ke) 10087; IP High Court, 2019 (Gyo-Ke) 10046

③ Whether the amended invention includes an integrally molded configuration is unrelated to new matter.

(Excerpts from the judgment)

It is clear that the invention at issue … includes a configuration without points ①–④ that the plaintiff contends are new configurations—that is, the configuration exactly as in the embodiment described in the specification of the US provisional application at issue…. This configuration constitutes one complete invention; it does not become complete as an invention only upon supplementation with configurations ①–④. In such a case, under Article 4F of the Paris Convention, priority may not be refused, nor may a patent application filed with a claim to Paris Convention priority be rejected, on the ground that it contains elements not included in the priority application. Rather, Paris Convention priority is denied only for the elements not included in the underlying application. Thus, to invalidate a patent arising from such an application, it is not enough merely to find that the patent contains elements absent from the application underlying Paris Convention priority; those elements must be found to lack novelty or inventive step in light of the cited invention…. …Otherwise, for example, suppose a patentee files a foreign application for an invention with Configuration A; after Invention B, which includes that configuration, becomes publicly known, the patentee files in Japan, claiming Paris Convention priority, an invention with Configuration A+C, combining Configuration A with Configuration C, which was not included in the foreign application but has novelty and inventive step over Invention B. Although the foreign application precedes Invention B for the Configuration A portion, priority is claimed, and Configuration C has novelty and inventive step over Invention B, the mere inclusion of Configuration C, absent from the foreign application, would necessarily result in denial even of priority for Configuration A and rejection of the application. Such a result is considered wholly unacceptable under Article 4F of the Paris Convention. Furthermore, because ①–④ can each constitute elements of independent inventions, novelty and inventive step over the cited invention must be considered separately for each configuration.… The tool in the Exhibit Ko 1 video has Configuration ③…. Because the claims of the invention at issue … include Configuration ③ …, the invention at issue … lacks novelty in relation to that video…. Accordingly, to determine whether Paris Convention priority is recognized, it is further necessary to determine whether Configuration ③ is absent from the US provisional application at issue. In contrast, the tool in the Exhibit Ko 1 video is not found to include Configurations ①, ②, or ④, leaving no room for a novelty issue, and there is insufficient argument or evidence to establish that these configurations lack inventive step over the invention in that video. Thus, without needing to determine whether these configurations are absent from the US provisional application,

the plaintiff's argument must be deemed unfounded.… Configuration ③ cannot be said to be absent from the US provisional application, so the plaintiff's argument on this point is also unfounded.… The invention at issue is not found to have a ground for invalidity based on lack of novelty or inventive step in relation to the Exhibit Ko 1 video.

The plaintiff argues that the amendment resulted in inclusion of a configuration in which each of the multiple pins is directly fixed to the base. However, …in the embodiments, the “pin bar” is a configuration for achieving various arrangements of multiple pins, not one essential to solving the invention's problem. Thus, it cannot be said that the original specification and other documents excluded a configuration without a pin bar—that is, the technical idea of supporting pins on the base without a “pin bar”…. The plaintiff also argues that “given that the decision considers the pins supported on the base in Invention 6 to include an integrally molded configuration of pins and base, it is clear that such a configuration is not disclosed.” However, the amendment did not recite the specific configuration of integral molding in the claims, and whether such a configuration is included in Invention 6 does not affect whether new matter has been added (it is merely a question of construing Invention 6). Accordingly, none of the plaintiff's above arguments can be accepted.

IP High Court, 2019 (Gyo-Ke) 10120 [Oil-cooled screw compressor] <Tsuruoka> Motivation found from a general problem

Original Ameblo publication: 2022-12-09

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12778473480.html

IP High Court, 2019 (Gyo-Ke) 10120 [Oil-Cooled Screw Compressor] <Tsuruoka>

Although not mentioned in the cited document, a general problem recognizable to a person skilled in the art at the filing date was held also to apply to the cited invention, establishing motivation.⇒ No inventive step

The judgment does not examine “the problem of the invention at issue.” Is this because the well-known problem is also the invention's problem?

(Excerpts from the judgment)

⋯A person skilled in the art is found able to recognize that the problem of reverse thrust force (a reverse thrust-load state) … arises in screw compressors generally, and can recognize that it also arises in the Exhibit Ko 1 invention…. Thus, for the Exhibit Ko 1 invention as well, …motivation arises to provide an unpressurized path to eliminate the reverse thrust load in order to solve that problem…. Accordingly, even if Exhibit Ko 1 does not directly mention the technical problem of reverse thrust force (a reverse thrust-load state) arising or the resolution of that problem, motivation arises to provide an unpressurized path in the Exhibit Ko 1 invention to solve it….

https://www.nakapat.gr.jp/ja/legal_updates_jp/%e3%80%90%e7%89%b9%e8%a8%b1%e2%98%85%e3%80%91%e5%af%a9%e6%b1%ba%e5%8f%96%e6%b6%88%e8%ab%8b%e6%b1%82%e4%ba%8b%e4%bb%b6%ef%bc%88%e5%bc%95%e7%94%a8%e6%96%87%e7%8c%ae%e3%81%ab%e8%a8%80%e5%8f%8a%e7%84%a1/

Tokyo District Court, 2020 (Wa) 13326, 13331 <Shibata>

[Forearm-fracture inhibitor containing eldecalcitol]

*Novelty of the “use” was denied.

“Limiting the subjects of administration to Type I osteoporosis patients should be assessed as a use contemplated by the Exhibit Otsu 1 invention, and cannot be said to constitute a difference from that invention.”

⇒ Found to lack novelty, rather than inventive step.

⇒ A useful holding, since it can also be used in cases involving an earlier-filed, later-published application (Article 29-2)!!

(Excerpts from the judgment)

Regarding the limitation of the subjects of administration to patients with Type I osteoporosis, at the priority date at issue, it had been proposed to classify as Type I osteoporosis the osteoporosis occurring in women during the first 15–20 years after menopause, characterized by an excessive and disproportionate phenomenon in cancellous bone compared with cortical bone…. It is clear that Type I osteoporosis as thus proposed is a type of osteoporosis. On the other hand, the specification contains no description whatsoever of effects or the like arising from distinguishing patients with Type I osteoporosis from the osteoporosis patients targeted by the Exhibit Otsu 1 invention as subjects of administration. Accordingly, limiting the subjects of administration to Type I osteoporosis patients should be assessed as a use contemplated by the Exhibit Otsu 1 invention, and cannot be said to constitute a difference from that invention.

Tokyo District Court, 1997 (Wa) 938 [Fragrant liquid bleach composition] (Kabi Killer)

Original Ameblo publication: 2022-12-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12778943331.html

Tokyo District Court, 1997 (Wa) 938

[Fragrant liquid bleach composition] (Kabi Killer)

*The claim term “containing” = in its ordinary sense, it is enough that the substance is contained.

*Direct infringement found for a product that changes over time.

Cf. Tokyo High Court, 2002 (Ne) 4193 “Doctor Blade case” (a referenced decision not separately discussed in this collection)

Cf. 2007 (Wa) 10364

Cf. IP High Court, 2011 (Ne) 10074

(Excerpts from the judgment)

Patented Invention 1 at issue is a product invention concerning a fragrant liquid bleach composition, with no limitation on its manufacturing method. Therefore, its technical scope should include not only cases where a fragrance recited in the claims is added from the outset, but also cases where, during manufacture, another fragrance capable of producing the claimed fragrance is added so that the claimed fragrance comes to be contained between manufacture and use.

⋯Even the defendant's experimental results establish that, 28 days after the experiment began, approximately one-third of the “dimethylbenzylcarbinyl isobutyrate” had changed into “dimethylbenzylcarbinol.” The defendant's product is a household mold remover, and the period of 28–30 days is by no means excessively long compared with the normal period from manufacture through distribution until the product reaches ordinary consumers. Moreover, the contents of a bottle of household mold remover are rarely used up at once; it is ordinarily kept in the home and used for cleaning and the like over a certain period. Accordingly, it is appropriate to find that a considerable portion of the “dimethylbenzylcarbinyl isobutyrate” in the defendant's product has changed into “dimethylbenzylcarbinol” by the time it is used by consumers.

Thus, although at the time of manufacture (the configuration described in item 1 of the attached “List of Defendant's Products”) the defendant's product does not contain any fragrance recited in Claim Element (1) of Patented Invention 1, subsequent changes over time inevitably cause it to contain the “dimethylbenzylcarbinol” recited in Claim Element (1). The defendant's act of manufacturing that product should therefore be regarded as an act of working Patented Invention 1.…

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-13508.pdf

IP High Court, 2019 (Gyo-Ke) 10041 [Wound dressing] <Kanno> Support requirement satisfied; inventive step satisfied

Original Ameblo publication: 2022-12-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12779095646.html

IP High Court, 2019 (Gyo-Ke) 10041 [Wound dressing] <Kanno>

<Support requirement>

*The support requirement was satisfied by a calculation based on the respective minimum values of two numerical ranges described in the specification.

“Calculating on the basis of the minimum diameter of 280 μm and the minimum density of 50 holes/cm² … gives an open-area ratio of 3.07%.… This is a matter equivalent to one described....”

<Inventive step>

*No motivation to extract only part of the secondary cited invention and apply it to the primary cited invention.

(Excerpts from the judgment)

<Support requirement>

⋯As to the open-area ratio of through-holes for retaining an appropriate amount of exudate on the wound site, the specification states that “the opening area at the first surface (11) preferably corresponds to a circle with a diameter of 280–1,400 μm” … and that “the through-holes (13) are preferably present at a density of 50–400 holes/cm², and more preferably at a density of 60–325 holes/cm²”…. Calculating from the minimum diameter of 280 μm and minimum density of 50 holes/cm² within the preferred ranges for through-hole diameter and density … gives an open-area ratio of 3.07%.… Although the invention-defining matter “an open-area ratio of 3.07% or more” is not directly stated in the detailed description, it can be said to be equivalent to a matter described there. Accordingly, it can be recognized that setting the through-holes to that open-area ratio solves the invention's problem.

<Inventive step>

⋯The invention described in Exhibit Ko 4 has an integrated structure comprising a first layer with numerous holes that form an appropriate storage space between the wound surface and the second layer, retain an appropriate amount of exudate on the wound surface, and prevent exudate from spreading in the in-plane direction; a second layer that is an initial water-pressure-resistant sheet material; and a sheet material capable of absorbing and retaining water (third layer). Because its technical significance lies in maintaining a moist wound surface through that structure, there is no motivation to extract only the first layer of the Exhibit Ko 4 invention and apply it to the Exhibit Ko 1 invention.… The three functions of Common General Technical Knowledge 1 asserted by the plaintiff are merely described in the above three patent documents concerning wound dressings having such functions. Disregarding the specific configurations of those wound dressings, those descriptions are insufficient to establish that, for wound dressings generally, providing the functions of Common General Technical Knowledge 1 is common general technical knowledge for effective moist wound therapy.

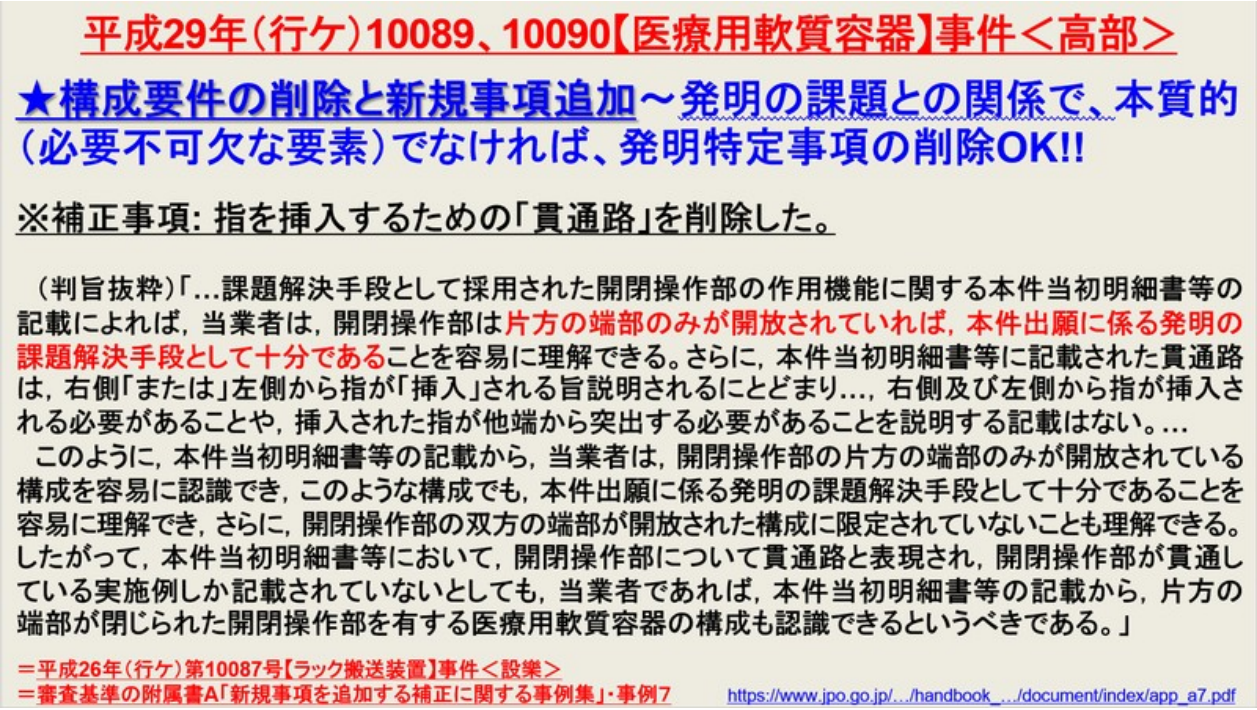
(YouTube Individual Patent Cases)

IP High Court, 2017 (Gyo-Ke) 10089, 10090 [Medical flexible container] case <Takabe>



<Deletion of claim elements and addition of new matter>

Deleting a matter specifying the invention is permissible if it is not essential (an indispensable element) in relation to the invention's problem!!

=IP High Court, 2014 (Gyo-Ke) 10087

=Examination Handbook, Annex A, section 7 (Amendments Adding New Matter), Example 7

https://www.youtube.com/watch?v=Y8NpVGolOeg

English translation of the figure

IP High Court, 2017 (Gyo-Ke) 10089 and 10090, “Medical Flexible Container” <Takabe>.

Deletion of a constituent feature and addition of new matter: in relation to the problem of the invention, deletion of a matter specifying the invention is permitted if it is not essential (indispensable)!! Amendment: the “through passage” for inserting a finger was deleted.

(Excerpt from the judgment) “… According to the description of the function of the opening operation portion adopted as a means for solving the problem in the original specification and other documents at issue, a person skilled in the art can easily understand that it is sufficient as a means for solving the problem of the invention in the application at issue if only one end of the opening operation portion is open. In addition, the through passage described in the original specification and other documents merely describes insertion of a finger from the right ‘or’ the left; it does not describe the necessity of insertion from both the right and the left, or of the inserted finger protruding from the other end. …

In this way, from the description in the original specification and other documents, a person skilled in the art can easily recognize a structure in which only one end of the opening operation portion is open, can easily understand that such a structure is sufficient as a means for solving the problem of the invention in the application at issue, and can further understand that it is not limited to a structure in which both ends of the opening operation portion are open. Therefore, even if the original specification and other documents describe the opening operation portion as a through passage and describe only embodiments in which the opening operation portion passes through, a person skilled in the art should be able to recognize, from that description, the configuration of a medical flexible container having an opening operation portion closed at one end."

2014 (Gyo-Ke) 10087, "Buckle Locking Device" <Shitara>, to the same effect. Appendix A to the Examination Handbook, "Case Examples concerning Amendments that Add New Matter," Examples 4 and 7. Displayed link: https://www.jpo.go.jp/…/handbook_…/document/app_a7.pdf.

[US Patents] Eli Lilly v. Teva The purpose of a method of use is construed restrictively by the preamble

Original Ameblo publication: 2022-12-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12781407031.html

[US Patents] 2021.08 CAFC Eli Lilly v. Teva

A method of using an apparatus or composition … ordinarily depends entirely on “what the method does.”

Because what the method does is ordinarily stated in the preamble, the purpose of a method of use tends to be construed restrictively by the preamble.

*In the United States as well, a method claim’s preamble may be construed as limiting in light of the specification and other relevant context; it was held limiting in this case.

IP High Court, 2020 (Gyo-Ke) 10089 [… Child … Seat] <Shoji>

Original Ameblo publication: 2023-01-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12782248249.html

2020 (Gyo-Ke) 10089 […Child … Seat] <Shoji>

*Claim language is interpreted according to its ordinary meaning unless the specification/drawings define or explain it in a meaning different from the ordinary one.

⇒ The JPO decision's claim construction, treating it as a ‘distinct structural element added further to those elements,’ was erroneous.

⇒ Inventive step: not satisfied

(Excerpt from the court's reasoning)

The gist of an invention should be identified on the basis of the claims, and it is appropriate to interpret the language of the claims according to its ordinary meaning, taking into account the common general technical knowledge in the relevant technical field before the priority date. Admittedly, if the specification or drawings define or explain the meaning of the claim language as differing from its ordinary meaning, there may be room to interpret it differently from its ordinary meaning. In the absence of such a definition or explanation, however, the interpretation set out above is appropriate.

…The invention at issue does not specify that the support member is located only inside the seat shell or does not cover the sides or back of the seat shell, nor does it specify that the support member has a skeletal structure separate from the seat shell; paragraph [0031] of the specification likewise contains no such statement. …No basis can be found for adopting the JPO decision's interpretation that it is … a structural element distinct from, and additionally provided beyond, the ‘seat shell’ and ‘flexible material supporting the child’ in the prior art (common general technical knowledge)….

IP High Court, 2018 (Ne) 10034 [Solenoid] <Kanno> — Reversed on appeal: claim limitations held satisfied

Original Ameblo publication: 2023-01-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12782413373.html

2018 (Ne) 10034 [Solenoid] <Kanno>

The claim construction concerning whether ‘sealing’ must be achieved by the end member itself was changed, and the patentee won a reversal!!

⇒ The limitation is satisfied because the effect is achieved in combination with the O-ring.

Over 70% of appellate reversals involve a change in claim construction.

The outcome depended on which paragraphs of the detailed description of the invention were emphasized.

⇒ The patentee prevailed on reversal in the appellate court (first-instance case: 2017 (Wa) 3569).

*The interpretation of ‘sealing fit’ was at issue both at first instance and on appeal.

⇒ The outcomes were opposite.

[Claim 1] A solenoid characterized by the provision of … an end member made of a corrosion-resistant material that is fitted sealingly into a mounting hole to close the opening of that mounting hole….

(Excerpt from the court's reasoning) …The language of the claims does not necessarily unambiguously specify how tightly mechanical parts must be ‘fitted’ so as to ‘seal tightly’ in order to constitute the ‘sealing fit’ in the invention at issue. Looking therefore to the specification to interpret the term, the specification states: ‘characterized by comprising an end member made of a corrosion-resistant material that is fitted sealingly into the mounting hole to close its opening’ (paragraph [0015]); and ‘As a result, the members of the solenoid housed inside the mounting hole that are farther inward than the end member are not exposed to the outside, and the entry of the external atmosphere (fluids such as moisture or water) is inhibited by the end member, making it possible to improve corrosion resistance in the state assembled to the mating housing member’ (paragraph [0016]). In light of these statements in the specification, …‘sealing’ in ‘sealing fit’ refers to a degree sufficient to ‘inhibit’ the entry of the external atmosphere (fluids such as moisture or water)…. …The invention also includes the defining feature ‘a sealing member arranged between the mounting hole and the end member to inhibit the entry of the external atmosphere’ (…). The specification states: ‘It is also preferable to provide a sealing member between the mounting hole and the end member. This further inhibits the entry of the external atmosphere’ ([0019]). Thus, the ‘sealing member arranged between the mounting hole and the end member’ in the invention can likewise be described as a member provided to further inhibit the entry of the external atmosphere. Accordingly, the effect of the invention—improved corrosion resistance of the solenoid—is understood to result … from the two components that inhibit the entry of the external atmosphere: (i) … the end member and (ii) … the sealing member. There is therefore no reason to adopt a restrictive interpretation requiring the ‘end member’ alone to completely prevent the entry of the external atmosphere.

It is undisputed between the parties that the defendant's product … has a sealing member at the outer end of the plate and has … a configuration that, when housed in the mounting hole, seals the space between the body and the mounting hole to inhibit the entry of outside air, moisture, and the like….

According to the results of the experiments in Exhibits Otsu 1, Otsu 14, Ko 49, Ko 58, Otsu 19, and Otsu 20, the defendant's product, which has an end member and a sealing member (O-ring), completely prevents the inflow of the external atmosphere (moisture, water, and the like). The defendant's product therefore inhibits the inflow of the external atmosphere by fitting the end member (H) into the opening on the upper

side of the body; by additionally having the sealing member, it seals the space between the body and the mounting hole and further inhibits that inflow. Consequently, the defendant's product also satisfies … the wording ‘“sealing” fit’….

[Patents] Divisional applications — Where the child application violates the divisional requirements/adds new matter, the grandchild's filing date does not relate back to the parent's!

Original Ameblo publication: 2023-01-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12782564506.html

[Patents] When divisional applications are filed in a parent–child–grandchild… chain, if the child application unlawfully violates the divisional requirements/adds new matter, the grandchild's filing date does not relate back to the parent's filing date!

An amendment to the child application has retroactive effect, and its content can change whether the division is proper. If a defect arising from added matter remains uncorrected, the grandchild application cannot benefit from the parent application’s filing date.

Comparison of the requirements for division and amendment regarding added matter ⇒ The cases apply the same standard.

Final rejection of the child application, final invalidation of the resulting patent, or withdrawal of the child application does not, by itself, render an otherwise proper grandchild divisional application improper.

https://www.nakapat.gr.jp/ja/legal_updates_jp/%e3%80%90%e7%89%b9%e8%a8%b1%e2%98%85%e2%98%85%e3%80%91%e5%af%a9%e6%b1%ba%e5%8f%96%e6%b6%88%e8%ab%8b%e6%b1%82%e4%ba%8b%e4%bb%b6%ef%bc%88%e8%a6%aa%e3%83%bb%e5%ad%90%e3%83%bb%e5%ad%ab%e3%81%a8/

[United States] Georgetown Rail v. Holland — Preambles and limitations on claim scope

Original Ameblo publication: 2023-01-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12782571634.html

[U.S. Patents] August 2017, CAFC, Georgetown Rail v. Holland

For the product invention at issue, the court held that the preamble did not limit the scope of rights, while identifying five circumstances in which a preamble may be limiting. (‘Mounted on a vehicle for movement along the railroad track’ describes a principal use of the invention and is not a structural limitation.)

(1) Where the preamble recites essential structure (essential components) or steps.

(2) Where the claim relies on the disputed preamble wording as an antecedent basis.

(3) Where the preamble is necessary (essential) to understand limitations or terms in the body of the claim.

(4) Where the preamble recites additional structure or steps emphasized in the specification as important.

(5) Where the preamble was expressly relied upon during prosecution to distinguish the claimed invention from the prior art.

<Reference> August 2021, CAFC, Eli Lilly v. Teva

In contrast to claims to apparatuses or compositions, methods of using apparatuses or compositions are not directed to what the method ‘is,’ but ordinarily depend entirely on what the method ‘does.’ What a method does is ordinarily stated in its preamble, and the purpose of a method of use therefore tends to be construed as limited by the preamble.

(*In the United States too, method inventions may be construed as limited by the preamble.)

2005 (Gyo-Ke) 10608 <Shinohara> — Correction requirements for a ‘disclaimer claim’

⇒ The correction did not exclude an overlap, and there was no allegation or proof that the technical concept differed markedly from the prior art.

⇒ Correction requirements: not satisfied

‘Leaving aside whether it is appropriate to treat a correction excluding overlap with prior art … as being within the scope of the matters described in the specification…’

(Excerpt from the court's reasoning)

…Leaving aside whether it is appropriate to treat a correction excluding overlap with prior art as a so-called ‘disclaimer claim’ falling within the matters described in the specification, …the correction at issue states, concerning aluminum in an iron-based material, that it ‘does not contain aluminum in an amount exceeding the amount contained as an unavoidable impurity.’ However, …even taking into account not only the description in the patent specification but also the common general technical knowledge of a person skilled in the art at the filing date…, it cannot be found clear what quantity is meant by ‘an amount exceeding the amount contained as an unavoidable impurity.’ It therefore cannot readily be found that the correction excludes the overlap with the cited invention, which contains ‘0.03–0.1% (preferably 0.03–0.07%) aluminum.’ Furthermore, according to …the common general technical knowledge of a person skilled in the art that aluminum added as a deoxidizer is sometimes also called an unavoidable impurity, published unexamined patent applications and other prior-art documents contain statements to the effect that, where aluminum is added as a deoxidizer, its proportion is limited to 0.1 percent or less because of its effect on the properties of the final product…. Thus, a case in which an iron-based material contains 0.03–0.1 percent aluminum, as in the cited reference, can also be described as a case that ‘does not contain aluminum in an amount exceeding the amount contained as an unavoidable impurity.’ In this respect too, the correction does not remove the overlap between the cited invention and Invention 1 at issue. Accordingly, since the correction cannot be found to remove the overlap between the cited invention and Invention 1 concerning aluminum content in an iron-based material, the plaintiff's argument, which presupposes that the overlap is removed, lacks its very premise…. …

…The foregoing treatment of so-called ‘disclaimer claims,’ as stated in …the Examination Guidelines…, is said to be permissible where an invention differs markedly in technical concept from the prior art and inherently involves an inventive step, but happens to overlap with that prior art. It is understood to be permissible for inventions whose technical concept differs markedly from the prior art irrespective of whether an amendment is made. In this case, limiting the aluminum content of the iron-based material as in the correction is a matter not described in the patent specification, nor can such a limitation be said to be self-evident from that specification…. Therefore, to argue that the correction is lawful under the foregoing treatment, the plaintiff must allege and prove, concerning Invention 1—which is understood to have no limitation on the aluminum content of the iron-based material—that its technical concept differs markedly from the cited prior-art invention and that it inherently involves an inventive step. The plaintiff, however, merely argues that the technical concept of an invention whose iron-based material ‘does not contain aluminum in an amount exceeding the amount contained as an unavoidable impurity’ differs from that of the cited invention. The plaintiff's argument is therefore without merit in this respect as well.

IP High Court, 2005 (Gyo-Ke) 10143 [Filter Substrate] <Nakano> — *Clarity requirement concerning the measurement method: not satisfied

Original Ameblo publication: 2023-01-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12783037318.html

2005 (Gyo-Ke) 10143 [Filter Substrate] <Nakano>

*Clarity requirement concerning the measurement method: not satisfied

⇒ Conditions and the like enabling measurement to the number of significant digits treated as meaningful in the specification must be stated.

—Values to the third decimal place are meaningful, but the value at that third decimal place cannot be identified accurately.

=2001 (Gyo-Ke) 209 (enablement requirement: not satisfied)

(Excerpt from the court's reasoning)

…The value of ‘Y/X^2’ defined in the claims … is meaningful to the third decimal place. If, when determining the ‘Y/X^2’ value of a sample, measurement error appears at the third decimal place, a situation arises in which it is impossible to determine whether that sample falls within the claims…. Therefore, the value of ‘Y/X^2’ must be accurately identifiable to the third decimal place…. As explained above, despite the significance of the value of ‘Y/X^2’ to the third decimal place, the value at that decimal place cannot be accurately identified. The feature ‘$Y/X^2 \geq 0.03$’ therefore cannot clearly express the technical scope of the invention at issue. In this respect, the claims in the specification must be regarded as unclear, and cannot be said to recite only matters indispensable to the configuration of the invention. Accordingly, the specification does not satisfy the requirements prescribed in Article 36(5)(ii) of the Act….

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-9353.pdf

Tokyo High Court, 2001 (Gyo-Ke) 209 [Cleaning Blade for an Electrophotographic Copying Machine] — Enablement requirement concerning the measurement method: not satisfied

Original Ameblo publication: 2023-01-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12783037437.html

2001 (Gyo-Ke) 209 [Cleaning Blade for an Electrophotographic Copying Machine]

Enablement requirement concerning the measurement method: not satisfied

⇒ Conditions and the like enabling measurement to the number of significant digits treated as meaningful in the specification must be stated.

It was understood that the ratio would vary with the type and number of columns used.

=2005 (Gyo-Ke) 10143 (clarity requirement: not satisfied)

(Claim after correction) A cleaning blade for an electrophotographic copying machine, characterized by being made of urethane rubber obtained by reacting polyisocyanate with a polyol having a molecular-weight distribution whose ratio of weight-average molecular weight (Mw) to number-average molecular weight (Mn), Mw/Mn, is 2 or less as measured by the GPC method.

(Excerpt from the court's reasoning)

…Focusing on the numerical value of the ratio (Mw/Mn), the first decimal place is treated as significant. Moreover, FT5, with a value of 2.0, is presented as a working example of the invention before correction, while FT11, with a value of 2.1, is presented as a comparative example; the comparison between these two values, differing by ‘1’ in the first decimal place, is intended to substantiate the effect described above. The original specification therefore treats values of the ratio (Mw/Mn) to the first decimal place as meaningful.

According to the … statements in Exhibit Ko 4, when that publication was issued in 1968, …it was generally understood that even when using the same GPC method, the ratio (Mw/Mn) would differ if the type or number of columns used differed. …At the time of publication of Exhibit Ko 4, namely before the application at issue, it was generally known that, when calculating the ratio (Mw/Mn) indicating molecular-weight distribution, a value significant to the first decimal place could not be obtained unless the method of determining it was specified. Further, …it can be inferred that this situation continued to exist at the filing date.

…Ultimately, the original specification does not describe how to obtain a polyol with a ratio (Mw/Mn) of 2 or less (treating the first decimal place as significant), and a person skilled in the art cannot understand what polyol to use as a raw material for the invention. Accordingly, the original specification cannot be found to describe the configuration of the invention sufficiently for a person skilled in the art to readily work the invention before correction.

Tokyo District Court, 2018 (Wa) 17586 et al. [Pharmaceutical] (Kowa v. Towa Pharmaceutical) — Second judgment (the patentee loses in the later damages action)

Original Ameblo publication: 2023-01-09

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12783380657.html

Tokyo District Court, 2018 (Wa) 17586, 2019 (Wa) 7191, 2020 (Wa) 7989, 2021 (Wa) 8097 <Shibata>

[Pharmaceutical] (Kowa v. Towa Pharmaceutical)

The patentee prevailed in the preceding injunction action (2017 (Ne) 10090 <Takabe>) (prior-use right not established).

⇒ The damages action (this case): violation of the support requirement

*The problem addressed by the invention was redefined using specific numerical values.

⇒ Without crystalline cellulose, achievement of the problem's solution cannot be recognized.

(On appeal, inventive step was denied.)

(Excerpt from the court's reasoning)

…The problem addressed by the inventions at issue is to provide a pharmaceutical product in which the rate of formation of the lactone form is suppressed. Solving that problem means, on the premise that these are inventions providing a pharmaceutical product, that lowering the moisture content to the fixed threshold of '2.9 mass% or less' suppresses the rate of formation of the lactone form (after two months at 40°C and 75% RH) to no more than some value between 0.23% and 0.35%….

…For the orally disintegrating tablets manufactured according to Formulation Example 1, it can be said that the specification describes how reducing the moisture content of the solid formulation to 2.9 mass% or less sufficiently suppresses the formation of the lactone form, thereby solving the problem addressed by the inventions.

On the other hand, the specification contains only the above working example as a working example of the inventions. It contains no working example showing the rate of formation of the lactone form when the moisture content of the solid formulation is reduced to 2.9 mass% or less for a pharmaceutical product of the inventions having a formulation other than the orally disintegrating tablets manufactured according to Formulation Example 1 in Table 2.

…The crystalline cellulose contained in the orally disintegrating tablets manufactured according to Formulation Example 1 may have contributed to the stability of pitavastatin calcium…. In addition, the specification does not describe the specific mechanism by which reducing the moisture content of the solid formulation to 2.9 mass% or less suppresses the formation of the lactone form…. Nor does it contain a working example showing the rate of formation of the lactone form when the moisture content is reduced to 2.9 mass% or less in a formulation other than the orally disintegrating tablets manufactured according to Formulation Example 1 in Table 2. There is also no common general technical knowledge that a pharmaceutical product with a suppressed rate of lactone formation can be provided using a formulation obtained by removing crystalline cellulose from the orally disintegrating tablets manufactured according to Formulation Example 1.

Taken together, these matters mean that, from the specification, a person skilled in the art cannot recognize that reducing the moisture content of the solid formulation to 2.9 mass% or less can provide, in a formulation excluding crystalline cellulose, a pharmaceutical product in which the rate of formation of the lactone form (after two months at 40°C and 75% RH) is suppressed to no more than some value between 0.23% and 0.35%. It must therefore be said that a person skilled in the art cannot recognize that the problem addressed by the inventions can be solved.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91417.pdf

IP High Court, 2022 (Ne) 10052 <Honda> [Pharmaceutical] (Kowa v. Towa Pharmaceutical) — *Patentee prevailed in the preceding injunction action

Original Ameblo publication: 2023-01-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12783549296.html

2022 (Ne) 10052 <Honda> [Pharmaceutical] (Kowa v. Towa Pharmaceutical)

*The patentee prevailed in the preceding injunction action.

2017 (Ne) 10090 <Takabe>: prior-use right not established

⇒ This case: inventive step not satisfied

*The judgment below found the support requirement not satisfied.

‘…cannot be found to be an essential feature of the Exhibit Otsu 12 invention. …There is no …factor teaching away from changing it.’

(Excerpt from the court's reasoning)

…The appellant argues that the Exhibit Otsu 12 invention necessarily has ‘a configuration coated with a layer of a material containing polyvinyl alcohol or a cellulose derivative as a film-forming agent,’ and that replacing this with …another coating is not contemplated; consequently, there is a factor teaching away from replacing that essential feature with the configuration of Corrected Invention 6 corresponding to Difference 2.

However, …an appropriate ‘film-forming agent’ for the Exhibit Otsu 12 invention is first understood to mean any agent applied as a coating to a core of a pharmaceutical dosage form containing particles or active substances (sensitive to environmental effects), which protects the active substances against environmental effects (such as oxidation and/or ambient humidity). The most preferable ‘film-forming agent’ is any agent protecting the active substances against oxidation. It is then natural to understand that, among those possible ‘film-forming agents,’ suitable ones are selected from the group consisting of polyvinyl alcohol (PVA) and cellulose derivatives. Accordingly, ‘a configuration coated with a layer of a material containing polyvinyl alcohol or a cellulose derivative as a film-forming agent’ cannot be found to be an essential feature of the Exhibit Otsu 12 invention. It therefore cannot be said that any factor teaches away from replacing that configuration with the configuration of Corrected Invention 6 corresponding to Difference 2.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91429.pdf

Tokyo District Court, 2008 (Wa) 38602 [Wireless Access Communication System] <Shoji> — Support and enablement requirements: not satisfied

Original Ameblo publication: 2023-01-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12783714900.html

2008 (Wa) 38602 [Wireless Access Communication System] <Shoji>

Not described in the detailed description of the invention

⇒ Support requirement: not satisfied

‘The portion of the invention … construed as … concerns matters not stated in the detailed description of the invention in the specification, etc., and …does not fall within a range in which the problem addressed by the invention can be recognized as solvable….’

⇒ Enablement requirement: not satisfied

The invention must be capable of being worked so as to achieve its functions and effects.

(Excerpt from the court's reasoning)

…The time control described in the original specification, etc. means controlling the time of transmission from a processor to a vocoder within the internal configuration of a switching system. There is no statement or suggestion whatsoever concerning control of the ‘time’ of ‘transmission’ from the ‘exit’ of the ‘switching system’…. …The part of the invention … construed as ‘means for controlling the time at which the exit of the switching system transmits incoming traffic, such that a packet carrying the incoming traffic is received at the entrance of the switching system within a predetermined window time before the time at which it is transmitted from the exit of the switching system’ …concerns matters not stated in the detailed description of the invention in the specification, etc. Nor does it fall within a range in which a person skilled in the art can recognize, on the basis of that detailed description, that the problem addressed by the invention can be solved. Nor, even in the absence of such a statement or suggestion, can it be said to fall within a range in which a person skilled in the art can recognize that the problem can be solved in light of the common general technical knowledge at the filing date….

…To satisfy the enablement requirement, the description must be sufficient for a person skilled in the art, in light of the common general technical knowledge at the filing date, to understand the invention accurately and reproduce it without excessive trial and error. It is appropriate to construe the requirement as also requiring that the intended functions and effects can thereby be achieved….

IP High Court, 2021 (Gyo-Ke) 10137 [Working Machine] <Shoji> — *Not recognizable from the external appearance of the publicly worked product ⇛ Novelty upheld

Original Ameblo publication: 2023-01-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12784240688.html

2021 (Gyo-Ke) 10137 [Working Machine] <Shoji>

‘Exhibition’ (attendees were allowed to touch the machine)

⇒ Claim elements not recognizable from the external appearance of the publicly worked product were not disclosed. Novelty upheld.

*Reproduction experiment: not reliable

*Blog by an exhibition attendee: insufficient recognition

Is the framework that novelty would be denied if a person skilled in the art could recognize the feature by touching the machine?

(Excerpt from the court's reasoning)

The plaintiff argues that a person skilled in the art who saw Inspection Exhibit Ko 1—which has the same structure as the working machine of the invention (except that the gas spring is oriented in the opposite direction)—at the exhibition could recognize the theoretical explanation of Claim Element G from common general knowledge of mechanics. The plaintiff further argues that Inspection Exhibit Ko 1 possesses Claim Element G because that element can be recognized by looking at Inspection Exhibit Ko 1…. However, …in light of the …relationship between the force (Fs) required to flip up the apron and the angle of the apron, … whether the machine has the configuration recited in Claim Element G, namely that ‘the force required to flip up the apron gradually decreases within a predetermined angular range as the apron angle increases,’ depends on the characteristics of the ‘gas spring’ used in the assist mechanism (the relationship between stroke length and gas reaction force, etc.). It is not something that can be recognized from external appearance alone…. …

Exhibit Ko 103 shows results measured …after this action was brought, and cannot be found to show the condition of Inspection Exhibit Ko 1 at the exhibition held …approximately six and a half years earlier…. …The measurement results in Exhibit Ko 103 are inconsistent with the behavior of the working machine filmed in Exhibit Ko 106-2, and those results cannot be regarded as reliable….

…A …blog …approximately two months after the exhibition states: ‘It seems …to make it easy to lift the leveling plate that cannot be lifted because the spring is too stiff.’ …However, while these statements suggest that the assist mechanism was configured to reduce the force required to lift the leveling plate, they cannot be regarded as describing an experience that ‘the force required to flip up the apron gradually decreases within a predetermined angular range as the apron angle increases.’

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91384.pdf

August 2019, CAFC, Iridescent Networks v. AT&T — Prosecution history of the parent application

August 2019, CAFC, Iridescent Networks v. AT&T

Opinions expressed in the prosecution history of a parent application affect claim construction in a continuation application where they relate to the patent claims of the continuation application.

An argument concerning the enablement requirement resulted in narrowing the claim scope.

https://openlegalcommunity.com/enablement-argument-narrowed-claim-scope/

[Trademarks] IP High Court, 2019 (Gyo-Ke) 10078 ‘AROMA ZONE’ — Domestic use/display even where the transfer occurs abroad

Original Ameblo publication: 2023-01-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12784525326.html

[Trademarks] 2019 (Gyo-Ke) 10078 ‘AROMA ZONE’ <Tsuruoka>

Although the trademark owner transferred the goods to a French retailer abroad, use in Japan was recognized on the basis of the owner’s knowledge that the goods would be sold to Japanese consumers and the retailer’s sales and displays directed to Japan!!

<Keywords>

‘An online shop operated by A, a Japanese national residing in France

Japanese language

Sales of goods directed to Japan

Japanese yen

Awareness that the goods would be sold to consumers in Japan’

(Excerpt from the court's reasoning)

‘L'Ange Bio is an online shop operated by A, a Japanese national residing in France. It operates in Japanese and sells goods to Japan. …During the period for which proof of use is required …L'Ange Bio's webpage listed the plaintiff's bottles and glass containers as goods for sale, with prices stated in Japanese yen.

…It can be inferred that the plaintiff transferred the goods for which use must be proved to L'Ange Bio bearing the trademark at issue, knowing that they would be sold to consumers in Japan, and that L'Ange Bio transferred the goods on which use is at issue to Japanese consumers, bearing the trademark, during the relevant period. At the very least, it is clear that L'Ange Bio displayed them for transfer.

On these facts, the trademark can be assessed as having been used within Japan during the relevant period, by the plaintiff as trademark owner, on the goods for which use must be proved.’

⇒ The foreign transfer, the owner’s knowledge of intended sales to Japanese consumers, and the sales and displays directed to Japan together supported the finding of “use in Japan.”

⇒ A useful judgment when considering whether the reasoning on ‘providing a program’ in the IP High Court's judgment in the earlier Dwango case also extends to tangible goods.

IP High Court, 2021 (Gyo-Ke) 10157, 10155 [Agent for Treating Movement Disorders] <Honda> — *Limiting the patient population supported inventive step

Original Ameblo publication: 2023-01-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12785805522.html

2021 (Gyo-Ke) 10157, 10155 [Agent for Treating Movement Disorders] <Honda>

*Although the active ingredient and disease were the same, novelty and inventive step were recognized by limiting the patient population!!

<Common features>

Active ingredient

Directed to animals with Parkinson's disease

Used in combination with L-dopa

<Difference 1>

The invention at issue

Targets '…patients who have reached a stage of exhibiting wearing-off phenomena and/or on-off fluctuations';

Is '…administered to those patients to reduce the off time of wearing-off phenomena and/or on-off fluctuations'; and

Is administered in '…L-dopa therapy.'

Cf. This requires consideration alongside 2021 (Gyo-Ke) 10066 and 2022 (Ne) 10065 <Shoji>, which denied novelty despite limiting the target anatomical site (for fracture suppression) (to the forearm).

⇒ The key is whether, at the priority date, a person skilled in the art could have recognized that the conventional pharmaceutical product was effective for that 'patient population' or 'anatomical site'!!

(Excerpt from the court's reasoning)

A person skilled in the art at the priority date cannot be found to have readily conceived, on the basis of Exhibit Ko A1, …of using KW-6002 for the use (method of use) of the invention corresponding to Difference 1. …None of Exhibits Ko A2 through Ko A5 discloses or suggests the configuration of the invention corresponding to Difference 1 (the configuration in which 'the agent' is administered 'in the L-dopa therapy' 'to reduce the off time of wearing-off phenomena and/or on-off fluctuations in the L-dopa therapy')…. …

Plaintiff Towa argues that a person skilled in the art encountering Exhibit Ko A1 could readily have conceived of the configuration of the invention corresponding to Difference 1, on the following grounds: (i) at the priority date, wearing-off was recognized as a phenomenon in which the duration of L-dopa's efficacy shortened, caused by an abnormality in the dopaminergic system; and (ii) at the priority date, it was widely known that KW-6002's mechanism of action was not dopaminergic like that of L-dopa and the like, but was based on a different mechanism. However, as to (i), …a person skilled in the art at the priority date recognized that, in addition to reduced dopamine-retention capacity of dopamine neurons and reduced dopamine-receptor sensitivity, presynaptic and postsynaptic events caused by continuous administration of L-dopa could also be important causes of wearing-off phenomena and on-off fluctuations. It therefore cannot be said …that such a person recognized wearing-off as caused exclusively by abnormalities of the

dopaminergic system. As to (ii), …the results show that, although there was no clear recovery from movement disorders 24 hours after administering KW-6002 alone, …when L-dopa was administered 24 hours after KW-6002, the action of L-dopa was enhanced six hours later. It is therefore difficult to imagine …that a person skilled in the art would understand KW-6002 to exert an independent action unrelated to the neural circuitry involved in L-dopa's action. Accordingly, it cannot be said that a person skilled in the art recognized the mechanism of KW-6002 in Exhibit Ko A1 as non-dopaminergic, unlike L-dopa and the like, and based on a different mechanism.

IP High Court, 2015 (Gyo-Ke) 10206 [Base Fabric for Airbags] <Takabe> — Unclear how far numerical values should be changed ⇛ Inventive step upheld

Original Ameblo publication: 2023-01-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12785954714.html

2015 (Gyo-Ke) 10206 [Base Fabric for Airbags] <Takabe>

<JPO decision>

Because it is an existing product already optimized for its function, a commensurate motivation is needed to change it.

⇒ Inventive step upheld

<This judgment>

There is motivation to move the numerical values of the publicly worked product toward those of the invention, but it is unclear how far they should be moved.

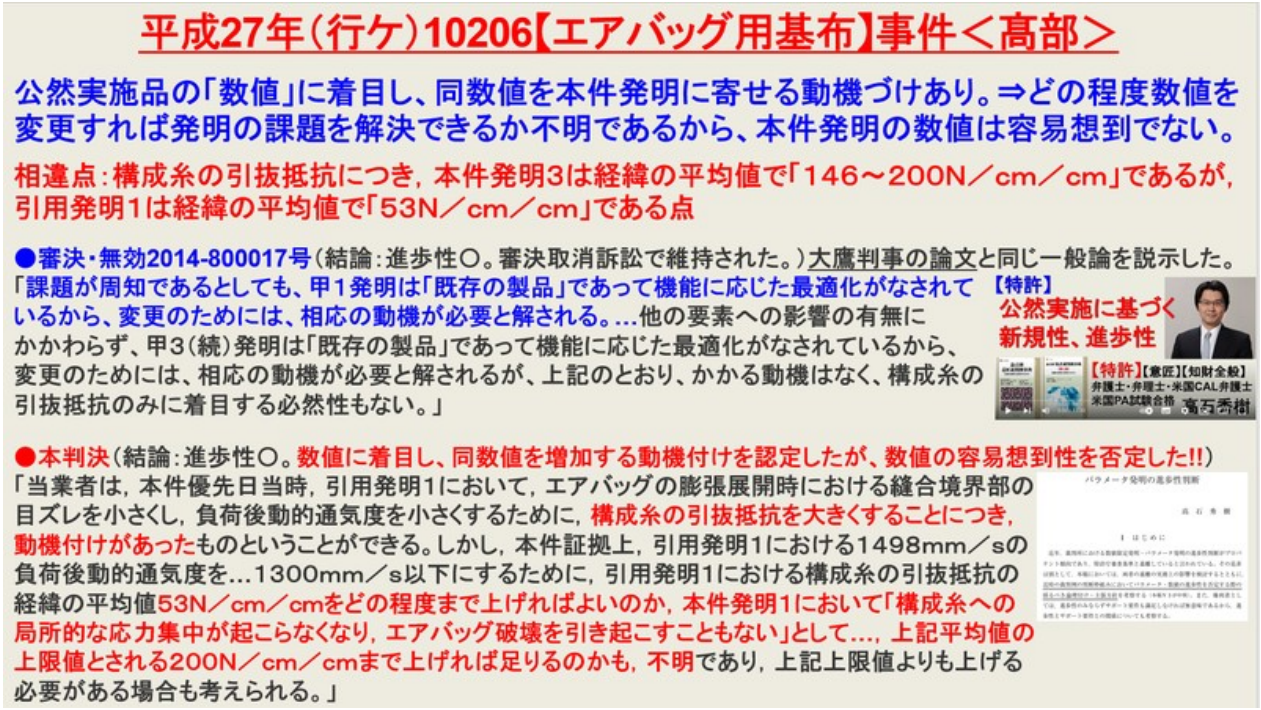
⇒ Inventive step upheld

Difference 1B: Dynamic air permeability. Invention 1 specifies ‘1,300 mm/s or less,’ whereas the cited invention has ‘1,498 mm/s.’

Difference 1C: Resistance to yarn withdrawal. Invention 3 specifies ‘146–200 N/cm/cm,’ whereas Cited Invention 1 has ‘53 N/cm/cm.’

<JPO decision (Conclusion: inventive step upheld; maintained)>

Even if the problem is well known, the Exhibit Ko 1 invention is an ‘existing product’ optimized for its function; a commensurate motivation is therefore considered necessary to change it. It cannot be said that there is motivation to alter, within the ranges specified in Invention 1, the boiling-water shrinkage, single-filament fineness of the constituent yarns, yarn-withdrawal resistance, and cover factor affecting dynamic air permeability in the Exhibit Ko 1 invention, to the extent of bringing that permeability within the specific range ‘1,300 mm/s or less.’ Nor is there evidence demonstrating that this is possible.



<This judgment>

(b) Increasing the cover factor

…It can be said that a person skilled in the art at the priority date would try increasing the cover factor of Cited Invention 1 above 2,131 to reduce seam slippage at the stitched boundaries when the airbag inflates and deploys, thereby reducing dynamic air permeability after loading. However, the evidence does not establish the relationship between the extent of increase in cover factor and the extent of decrease in dynamic air permeability after loading; nor is there any indication that common general technical knowledge on this point existed at the priority date. It is therefore unclear how far the cover factor of 2,131 in Cited Invention 1 must be raised to reduce its dynamic air permeability after loading from 1,498 mm/s … to 1,300 mm/s or less. It is conceivable that it would need to be raised beyond the upper limit of the 2,100–2,500 range specified for the cover factor in Invention 1 as more preferable …‘from the perspective of achieving both deployment performance and productivity.’ Moreover, since the cover factor is calculated from the average total yarn fineness in the warp and weft directions and the average weaving density in those directions…, changing the cover factor also affects the total fineness of the constituent yarns….

(c) Increasing resistance to yarn withdrawal

…It can be said that, at the priority date, a person skilled in the art had motivation to increase the yarn-withdrawal resistance of Cited Invention 1 to reduce seam slippage at the stitched boundaries during airbag inflation and deployment, thereby reducing dynamic air permeability after loading. However, the evidence does not establish how far the average warp/weft yarn-withdrawal resistance of 53 N/cm/cm in Cited Invention 1 must be raised to reduce its dynamic air permeability after loading from 1,498 mm/s …to 1,300 mm/s or less. Nor is it clear whether raising it to 200 N/cm/cm, the upper limit for that average value in Invention 1—at which …'localized stress concentration in the constituent yarns no longer occurs, and airbag rupture is not caused'—would suffice. It is conceivable that an increase beyond that upper limit would be necessary.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-86260.pdf

English translation of the image

2015 (Gyo-Ke) 10206 [Base Fabric for Airbags] <Takabe>

Attention was directed to the numerical value of the publicly worked product, and there was motivation to bring that value closer to the claimed invention. However, because it was unclear to what extent the value should be changed to solve the invention's problem, the claimed numerical value was not readily conceivable.

Difference: As to the pull-out resistance of the constituent yarns, Invention 3 has a warp-and-weft average of 146–200 N/cm/cm, whereas Cited Invention 1 has a warp-and-weft average of 53 N/cm/cm.

JPO trial decision: Invalidation No. 2014-800017. Conclusion: inventive step affirmed; maintained in the action seeking revocation of the trial decision. General reasoning similar to that in the Grand Panel decision was stated. 'Even if the problem is well known, Exhibit Ko 1 Invention is an existing product that has been optimized according to its function, and therefore a corresponding motivation is considered necessary to change it. … Irrespective of whether other factors have an effect, Exhibit Ko 3 (New) Invention is an existing product that has been optimized according to its function, and therefore, as stated above, a corresponding motivation is considered necessary to change it. There is no such motivation, and there is also no necessity to focus only on the pull-out resistance of the constituent yarns.'

Court judgment: Inventive step affirmed. Although the court focused on the numerical value and found motivation to increase it, the numerical value was held not readily conceivable.

‘It can be said that, as of the priority date, a person skilled in the art had motivation in Cited Invention 1 to increase the pull-out resistance of the constituent yarns in order to reduce seam slippage at the stitched boundaries during airbag inflation and deployment and to reduce dynamic air permeability after loading. However, on the evidence in this case, it is unclear to what extent the warp-and-weft average pull-out resistance of 53 N/cm/cm in Cited Invention 1 should be increased to reduce its dynamic air permeability after loading from 1498 mm/s … to 1300 mm/s or less. It is also unclear whether it would suffice to raise that average to 200 N/cm/cm, the upper limit stated in Invention 1 … at which “localized stress concentration in the constituent yarns does not occur, and airbag rupture is not caused.” It is conceivable that an increase beyond that upper limit would be necessary.’

IP High Court, 2021 (Gyo-Ke) 10066 <Shoji> [Agent Containing Eldecalcitol for Suppressing Forearm Fractures]

Original Ameblo publication: 2023-02-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12787073033.html

2021 (Gyo-Ke) 10066 <Shoji> [Agent Containing Eldecalcitol for Suppressing Forearm Fractures]

=2022 (Ne) No. 10065

*Novelty of the use denied

‘A person skilled in the art would not recognize the pathological condition of the forearm bones and the resulting fracture risk as differing from the pathological condition and fracture risk of bones at other sites.’

≈ Tokyo District Court, 2020 (Wa) 13326, 13331 <Shibata>

(Excerpt from the court's reasoning)

…According to the common general technical knowledge, a person skilled in the art would recognize the ‘osteoporosis therapeutic agent’ of the Exhibit Ko 1 invention as an agent administered to patients whose bones throughout the body, including the vertebrae, forearms, femurs, and upper arms, have reduced strength caused by loss of bone mass and deterioration of bone microarchitecture, in order to reduce fracture risk at each site. Further, …according to the common general technical knowledge, a person skilled in the art would expect eldecalcitol to affect both cancellous and cortical bone, and would recognize that its effects extend to the forearm bones, which comprise cancellous and cortical bone. Furthermore, under the common general technical knowledge referred to in (3)(b) and (c) above, a person skilled in the art would recognize that osteoporosis can cause fractures from external force at any bodily site, and that forearm fracture risk has in common with fracture risk at other sites susceptible to osteoporotic fractures the fact that it increases as bone strength declines. Taking these circumstances into account, it must be said that a person skilled in the art would not recognize the pathological condition of the forearm bones and the resulting fracture risk in osteoporosis patients as differing from those of bones at other sites, nor recognize the purpose and effects of administering eldecalcitol as the ‘osteoporosis therapeutic agent’ of the Exhibit Ko 1 invention as differing between the forearm and other sites….

It must be said that specifying the use of eldecalcitol as ‘for suppressing non-traumatic forearm fractures’ would not lead a person skilled in the art to recognize that an unknown function or effect of eldecalcitol would arise, or that it could treat a pathological condition different from that treated by eldecalcitol administered as an osteoporosis therapeutic agent. Accordingly, the corrected inventions cannot be regarded as use inventions that discover an unknown property of the known substance eldecalcitol and, through that property, discover its suitability for a new use. The use corresponding to Difference 1 is therefore not distinguishable from the use as an ‘osteoporosis therapeutic agent’ in the Exhibit Ko 1 invention. …Thus, Difference 1 is not a substantive difference.

Tokyo District Court, 2018 (Wa) 1130 [Printed Retroreflective Sheet] <Tanaka> — Trends in damages after the Grand Panel judgment

Original Ameblo publication: 2023-02-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12788073766.html

Tokyo District Court, August 31, 2021, 2018 (Wa) 1130 [Printed Retroreflective Sheet] <Tanaka>

The royalty rate (5%) proposed by the patentee during pre-litigation negotiations was considered as one factor, and the royalty rate determined retrospectively was held to be 10%, twice that rate.

Observations — Trends in damages after the Grand Panel judgment in the Carbon Dioxide-Containing Viscous Composition case

(Excerpt from the court's reasoning)

It is established that, before bringing this action, the plaintiff proposed a 5% license royalty for the patent to the 3M group, including the defendants…; that, on the other hand, U.S. 3M had argued in a patent-infringement action previously brought against a third party that the royalty rate for a retroreflective-sheet patent was 9%…; that U.S. 3M and others had agreed on a royalty rate of 20% in a prior action against a third party…; and that …defendant 3M Japan and others argue for a royalty rate of 10% in a patent-infringement action they brought against the plaintiff…. …

The royalty rate receivable for the working at issue, to be determined retrospectively for the defendants who infringed the patent, is not less than 10%….

https://www.nakapat.gr.jp/ja/legal_updates_jp/%e3%80%90%e7%89%b9%e8%a8%b1%e2%98%85%e3%80%91%e7%89%b9%e8%a8%b1%e6%a8%a9%e4%be%b5%e5%ae%b3%e5%b7%ae%e6%ad%a2%e7%ad%89%e8%ab%8b%e6%b1%82%e4%ba%8b%e4%bb%b6%ef%bc%88%e7%89%b9%e8%a8%b1%e6%a8%a9%e8%80%85/

Tokyo District Court, 1998 (Wa) 16963 [Moon Projector] <Mimura> — Entering into a contract for work also constitutes ‘transfer’

Original Ameblo publication: 2023-02-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12788235310.html

Tokyo District Court, 1998 (Wa) 16963 [Moon Projector] <Mimura>

*Entering into a contract for work also constitutes ‘transfer.’

‘Entering into a contract for work to manufacture and deliver Defendant's Apparatus 2 for consideration is also construed to constitute “transfer” as prescribed in Article 2 of the Patent Act, and therefore constitutes an act infringing Patent Right 2 at issue.’

*The court held that the prior-use product did not embody the technical concept of the patented invention.

‘Defendant's Apparatus 3 does not embody the technical concept of attaching to the light-beam outlet an eyepiece tube of such a length that the tip of the eyepiece reaches an observer on the floor. Accordingly, the difference between Invention 2 and Defendant's Apparatus 3 concerning the length of the eyepiece tube cannot be regarded as a mere difference in mode of implementation, and the technical concepts embodied in Invention 2 and Defendant's Apparatus 3 cannot be said to be identical.’

IP High Court, 2019 (Ne) 10007 [Apparatus Displaying a Ladder Circuit When … an Abnormality Occurs] <Kanno> — Indirect infringement under Article 101(ii)

Original Ameblo publication: 2023-02-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12788236074.html

2019 (Ne) 10007 [Apparatus Displaying a Ladder Circuit When … an Abnormality Occurs] <Kanno>

For an invention combining existing components, each of the existing components (the programmable display unit itself and its OS) was found to be indispensable.

⇒ Indirect infringement under Article 101(ii) established

The court below, Osaka District Court, 2015 (Wa) 8974, also found Article 101(ii) satisfied.

(Excerpt from the court's reasoning)

(d) Defendant's Product 3

Defendant's Product 3 stores the circuit-monitoring-function portion and the like of the extension/optional-function OS. Installing it on Defendant's Display A enables the circuit-monitoring function and the like to be used on Display A. The circuit-monitoring-function portion and the like of Product 3 and its other portions are found to form an integrated whole both physically and functionally.

Accordingly, Defendant's Product 3 as a whole is a characteristic component that directly provides the characteristic technical means of Invention 1.

Defendant's Product 3 therefore constitutes an article indispensable to solving the problem addressed by Invention 1.

(e) Defendant's Display A

The configuration that searches for a contact by touch when an abnormality occurs—the characteristic technical means newly disclosed by Invention 1—can be realized only when both Defendant's Display A and Defendant's Product 3 are present. As the first-instance defendant itself acknowledges, the only OS that can be installed on Display A to realize the circuit-monitoring function and the like is Product 3, and the only display on which Product 3 can be installed to realize those functions is Display A…. Thus, Display A can function so as to realize that configuration when, and only when, the OS of Product 3 is installed. Moreover, both Display A and Product 3 are produced and sold by the first-instance defendant, which is thoroughly familiar with the configuration described above, deliberately selected it, and provides both products to customers.

In view of these matters, although the fact that Display A and Product 3 happen to be physically separate products distributes a single function among multiple components, Display A is intrinsically functionally integrated and inseparable from Product 3. Even if treated as an independent product, it must be regarded as constituting a characteristic component or the like that directly provides the characteristic technical means of Invention 1. Accordingly, Defendant's Display A is an article indispensable to solving the problem addressed by Invention 1.

IP High Court, 2021 (Gyo-Ke) 10111 [Laser Processing Apparatus] <Kanno> — Disclaimer claims and inventive step

Original Ameblo publication: 2023-02-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12788236476.html

2021 (Gyo-Ke) 10111 [Laser Processing Apparatus] <Kanno>

The absence of grooves was discerned from the drawings in the specification, and a correction introducing a disclaimer was permitted. Because grooves are essential to the cited invention, there is a factor teaching away from the modification. ⇒ Inventive step upheld

<Observations>

(1) Amendments, corrections, divisional applications, etc. based on drawings (addition of new matter)

(2) Disclaimer claims and inventive step

(Excerpt from the court's reasoning)

<Addition of new matter>

Correction 1 merely excludes from the invention of Claim 1 before correction a ‘silicon wafer in which a groove along the predetermined cutting line is formed in the silicon single-crystal structure portion,’ or an apparatus necessarily requiring a groove, which had been conceptually encompassed. Accordingly, Correction 1, intended to narrow the claims, adds no new technical matter to the ‘laser processing apparatus’ of Claim 1. Even in light of the specification, …Figures 1 and 3 of the specification, etc. are plan views showing predetermined cutting lines on workpiece 1, while both Figure 2, a cross section along line II–II in Figure 1, and Figure 4, a cross section along line IV–IV in Figure 3, show that no grooves are formed. …Figures 1–4 depict ‘predetermined cutting lines’ but not ‘grooves.’ If the invention before correction presupposed the presence of ‘grooves,’ it would be unnatural to depict the ‘predetermined cutting lines’ while deliberately omitting the ‘grooves.’

<Inventive step>

It is inconceivable that a person skilled in the art encountering Exhibit Ko 11 would disregard groove portions 203, which generate internal stress used to cut the semiconductor wafer, in substrate 201. There is not only no motivation to adopt, as the workpiece, a substrate 201 without grooves along the break lines and to modify it so as to form a processing-modified region inside substrate 201 whose surface has no grooves; rather, there is a factor teaching away from such a modification….

IP High Court, 2021 (Gyo-Ke) 10093 [Second PCSK9 Litigation (Regeneron)] — Unlike the first litigation, support requirement not satisfied

Original Ameblo publication: 2023-02-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12788553594.html

2021 (Gyo-Ke) 10093 <Kanno> [Second PCSK9 Litigation (Regeneron)]
⇒ Support requirement not satisfied—the exact opposite of the first litigation (Sanofi).
*Not the presiding judge in the series of earlier litigation
*Arguments based on a mechanism not considered in the earlier action
*In this case, the court rejected the view that reciting the effect in the claim was sufficient to satisfy the support requirement.
*Emphasis on expert opinions
[Claim 1] An isolated monoclonal antibody capable of neutralizing the binding of PCSK9 to LDLR protein and competing, for binding to PCSK9, with an antibody comprising a heavy chain including a heavy-chain variable region consisting of the amino-acid sequence of SEQ ID NO: 49 and a light chain including a light-chain variable region consisting of the amino-acid sequence of SEQ ID NO: 23.
(Excerpt from the court's reasoning)
…The problem addressed by the invention is, in the first place, …to provide an antibody that neutralizes the binding between LDLR protein and PCSK9—which, by binding to LDLR protein, decreases the amount of LDLR protein and increases the amount of LDL in a subject—or a pharmaceutical composition containing that antibody. In relation to solving that problem, no independent significance can be found in competition with the reference antibody itself. From this perspective too, …the technical significance of the invention must be said to lie in identifying that an antibody competing with the 21B12 antibody possesses the functional characteristics of a binding-neutralizing antibody through the same mechanism as the 21B12 antibody….
The defendant argues …that even if antibodies existed that compete with the 21B12 antibody (the reference antibody) but cannot neutralize binding between PCSK9 and LDLR protein, such antibodies are excluded by the claim wording from the technical scope of Invention 1, and therefore do not provide a reason for finding a violation of the support requirement. However, as already explained, the technical significance of the invention must be said to lie in identifying that an antibody competing with the 21B12 antibody has the functional characteristics of an antibody neutralizing binding between PCSK9 and LDLR protein through the same mechanism as the 21B12 antibody. If antibodies competing with 21B12 include antibodies without binding-neutralizing ability, the premise of that technical significance plainly collapses. (In a case such as this, if it were sufficient merely to exclude antibodies lacking binding-neutralizing ability by claim wording, extremely broad definitions of the antibody's binding site on PCSK9—for example, most of PCSK9—would also be permitted. That would allow claims to be broadened without legitimate grounds and is therefore inappropriate.) …
In the separate action to revoke the JPO decision concerning the invention, …Sanofi's arguments regarding violation of the support requirement were rejected. However, this can also be understood as resulting from the assumption, taken for granted in light of the allegations and evidence then presented, that antibodies competing with the 21B12 antibody bind to substantially the same location on PCSK9 and have the same function as that antibody. In contrast, in this action, new arguments based on new evidence—including structural analyses in the respective statements of Dr. [A] and Dr. [B] and the expert report of Professor [F] …, and relevant documentary evidence concerning ‘EGFa-mimic antibodies’…—have cast doubt on that premise, yet no material supporting it can be found. There is therefore a commensurate reason for the conclusion of the separate judgment and the determination in this case to differ.

IP High Court, 2021 (Gyo-Ke) 10140 [Electroformed Tube] <Kanno> — *Violation of the clarity requirement for a PBP claim

Original Ameblo publication: 2023-02-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12788789259.html

2021 (Gyo-Ke) 10140 [Electroformed Tube] <Kanno>

*Violation of the clarity requirement for a product-by-process (PBP) claim

⇒ If, at the filing date, the structure or properties of the resulting product are unambiguously clear from the claims, specification, drawings, and common general technical knowledge, the clarity requirement is not violated even without impossible or impractical circumstances.

⇒ This invention is not unambiguously clear.

⇒ The defendant acknowledged that no impossible or impractical circumstances existed.

*How is this consistent with cases finding that claims were not PBP claims within the meaning of the Supreme Court judgment?

(Excerpt from the court's reasoning)

…Even where claims for a patent on a product invention recite the manufacturing process for that product, if, unlike the general situation described above, it is unambiguously clear at the filing date from the claims, specification, drawings, and common general technical knowledge what structure or properties the product manufactured by that process represents, third parties' interests are not unjustly harmed. It is therefore understood that there is no violation of the clarity requirement even in the absence of impossible or impractical circumstances….

…The specification neither states nor suggests anything concerning the inner-surface accuracy of electroformed tubes manufactured by the processes of Invention 6 and Corrected Invention 9. The specification describes the following methods of removing the fine wire: (i) forming a gap between the electrodeposit, etc. and the fine wire by heating and thermally expanding the electrodeposit, etc. or cooling and shrinking the wire; (ii) making the contact area between the fine wire and the electrodeposit, etc. slippery by immersing it in liquid or pouring liquid over it; (iii) pulling from one or both ends to deform it so as to reduce its cross-sectional area and thereby form a gap between the fine wire and the electrodeposit, etc., then gripping and pulling it, suctioning it, physically pushing it, or forcing it out by ejecting gas or liquid; and (iv) melting or dissolving it with heat or a solvent ([0041], [0116]). However, there is no description whatsoever of the technical relationship between these methods and the inner-surface accuracy of the electroformed tube produced, much less any statement or suggestion that the manufacturing processes of Invention 6 and Corrected Invention 9 (included in method (iii) above) signify a particular inner-surface accuracy different from that of tubes produced by other methods. Nor can it be found that there was common general technical knowledge as to whether these methods produce differences in inner-surface accuracy. Accordingly, the structure or properties of electroformed tubes produced by the manufacturing processes of Invention 6 and Corrected Invention 9 cannot be said to be unambiguously clear….

In view of the foregoing, Invention 6 and Corrected Invention 9 can be regarded as clear only if, at the filing date, circumstances existed that made it impossible or impractical to identify the electroformed tubes of those inventions directly by their structure or properties. The defendant acknowledges that no such circumstances existed.

[U.S. Patents] Novelty, MPEP — April 2015, CAFC, INEOS v. BERRY PLASTICS

Original Ameblo publication: 2023-02-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12788878935.html

[U.S. Patents] Novelty, MPEP

1. If a specific prior-art example falls within the claimed range, that range lacks novelty.

2. 2012 (CAFC), Clear Value v. Pearl River

3. Prior art teaching a numerical value or range extremely close to, but not overlapping or touching, the claimed range does not deprive the claim of novelty.

Cf. 2014 (CAFC), In re Patel (an obviousness decision holding that proximity of the numerical ranges alone was insufficient to establish a prima facie case of obviousness).

April 2015, CAFC, INEOS v. BERRY PLASTICS

Even if the claimed numerical range overlaps the cited invention, novelty may be recognized if criticality over the prior art is demonstrated.

⇒ In this case, the ultimate conclusion was negative.

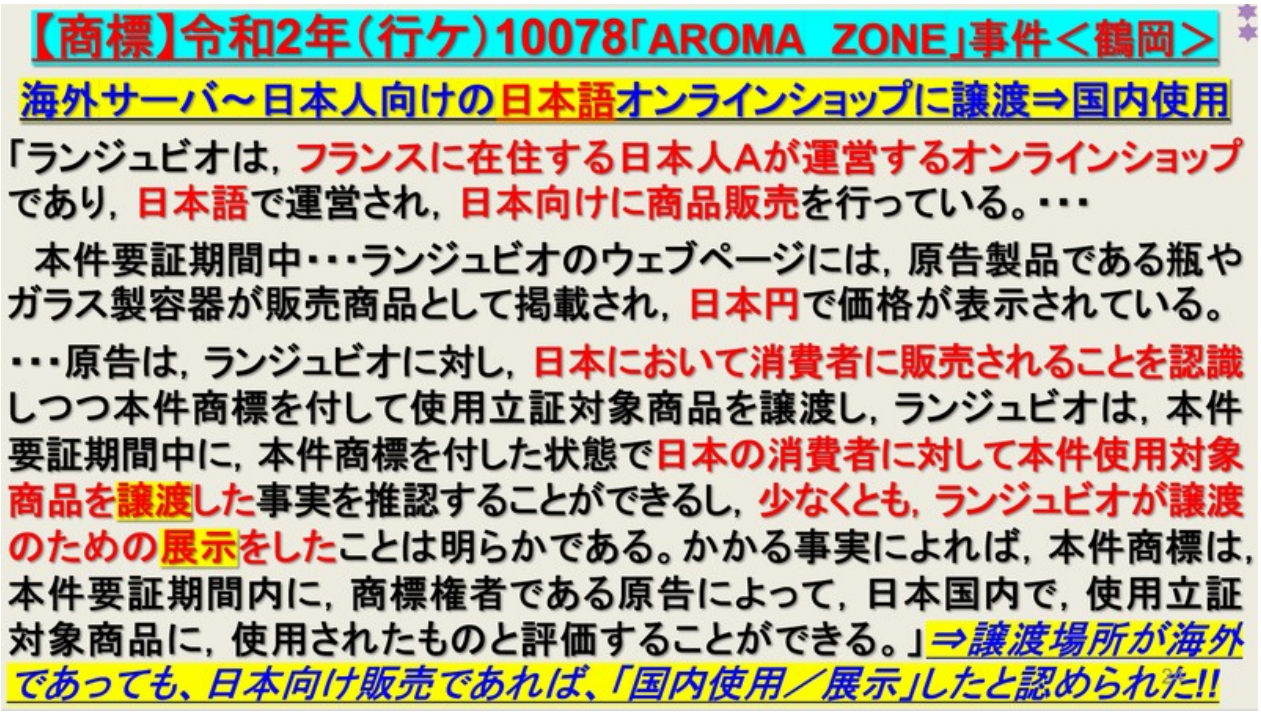
[Trademarks] IP High Court, 2019 (Gyo-Ke) 10078 ‘AROMA ZONE’ — ★Foreign server; directed to Japanese customers ⇛ Domestic use upheld

Original Ameblo publication: 2023-02-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12789681608.html



[Trademarks] 2019 (Gyo-Ke) 10078, ‘AROMA ZONE’ case <Tsuruoka>

Foreign server — Goods transferred to a Japanese-language online shop directed to Japanese customers, with knowledge of sales in Japan ⇒ Domestic use upheld

‘An online shop operated by A, a Japanese national residing in France, operating in Japanese and selling goods to Japan. …Prices are displayed in Japanese yen. …It can be inferred that the goods at issue were transferred to Japanese consumers; at the very least, it is clear that L’Ange Bio displayed them for transfer.’

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-89219.pdf

Correction to the image heading: the case number is 2019 (Gyo-Ke) 10078; the judgment date is January 28, 2020.

English translation of the image

[Trademarks] 2019 (Gyo-Ke) 10078 [AROMA ZONE] <Tsuruoka>

Foreign server — transfer to a Japanese-language online shop selling to Japan ⇒ Domestic use.

‘L’Ange Bio is an online shop operated by A, a Japanese national residing in France; it is operated in Japanese and sells goods to Japan. … During the relevant period … L’Ange Bio's webpage listed the plaintiff's bottles and glass containers as products for sale, and prices were displayed in Japanese yen. … The plaintiff transferred the goods offered as evidence of use, bearing the trademark at issue, to L’Ange Bio with knowledge that they would be sold to consumers in Japan. It can be inferred that, during the relevant period, L’Ange Bio transferred the goods at issue bearing the trademark to Japanese consumers; at the very least, it is clear that L’Ange Bio displayed them for transfer. In light of these facts, the trademark can be

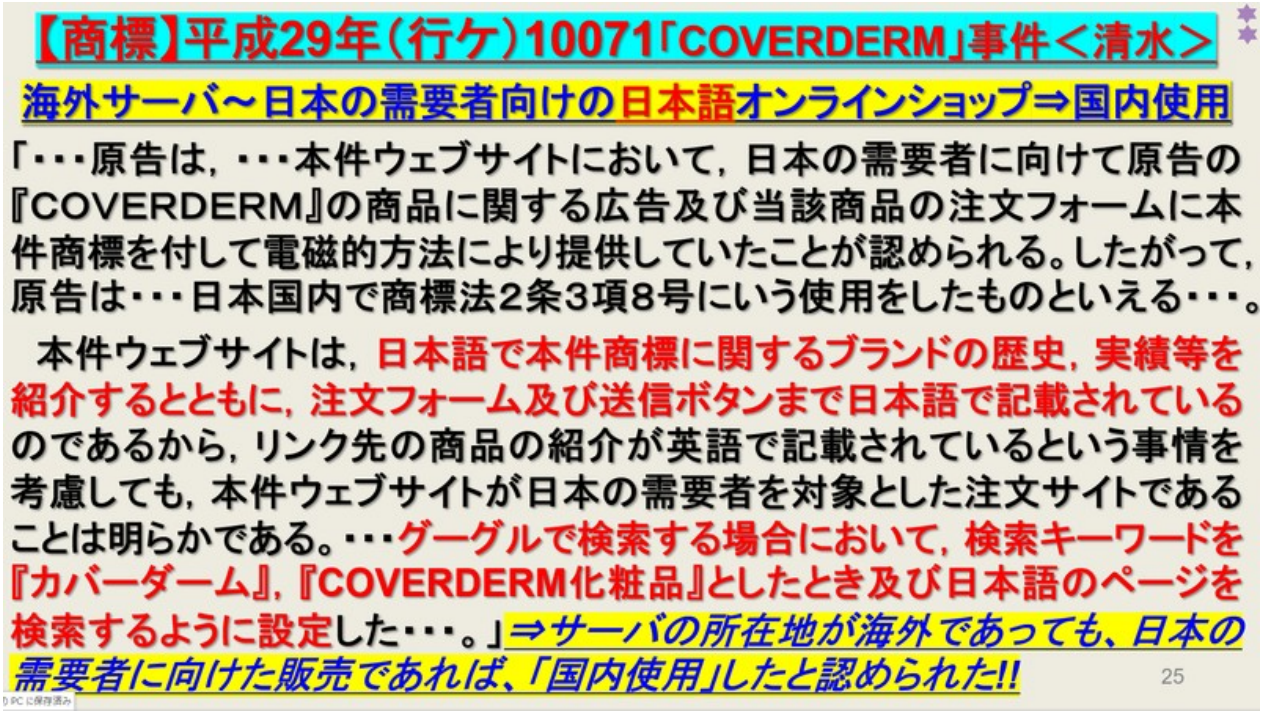
assessed as having been used by the plaintiff, its owner, in Japan, for the goods offered as evidence of use during the relevant period.’

⇒ Even if the place of transfer is abroad, sales directed to Japan were recognized as domestic use or display!!

[Trademarks] IP High Court, 2017 (Gyo-Ke) 10071 ‘COVERDERM’ — ★Foreign server; Japanese language ⇛ Domestic use upheld

Original Ameblo publication: 2023-02-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12789682044.html



[Trademarks] 2017 (Gyo-Ke) 10071, ‘COVERDERM’ case <Shimizu>

Foreign server — Japanese-language online shop directed to Japanese consumers ⇒ Domestic use upheld

‘In Japanese …introducing the brand's history, achievements, and the like, with even the order form and submit button in Japanese.’

‘When searching on Google …the settings were configured to search Japanese-language pages.’

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-87298.pdf

English translation of the image

[Trademarks] 2017 (Gyo-Ke) 10071 [COVERDERM] <Shimizu>

Foreign server — Japanese-language online shop directed to Japanese consumers ⇒ Domestic use.

‘… The plaintiff … is found to have provided, by electronic means, advertising relating to its COVERDERM products and order forms for those products bearing the trademark on the website at issue to consumers in Japan. Accordingly, the plaintiff … can be said to have made use in Japan within the meaning of Article 2(3)(viii) of the Trademark Act. … The website at issue introduces, in Japanese, the history and achievements of the brand relating to the trademark, and even its order form and submit button are written in Japanese. Thus, even taking account of the fact that the products on the linked site are introduced in English, it is clear that the website at issue is an ordering site directed to Japanese consumers.

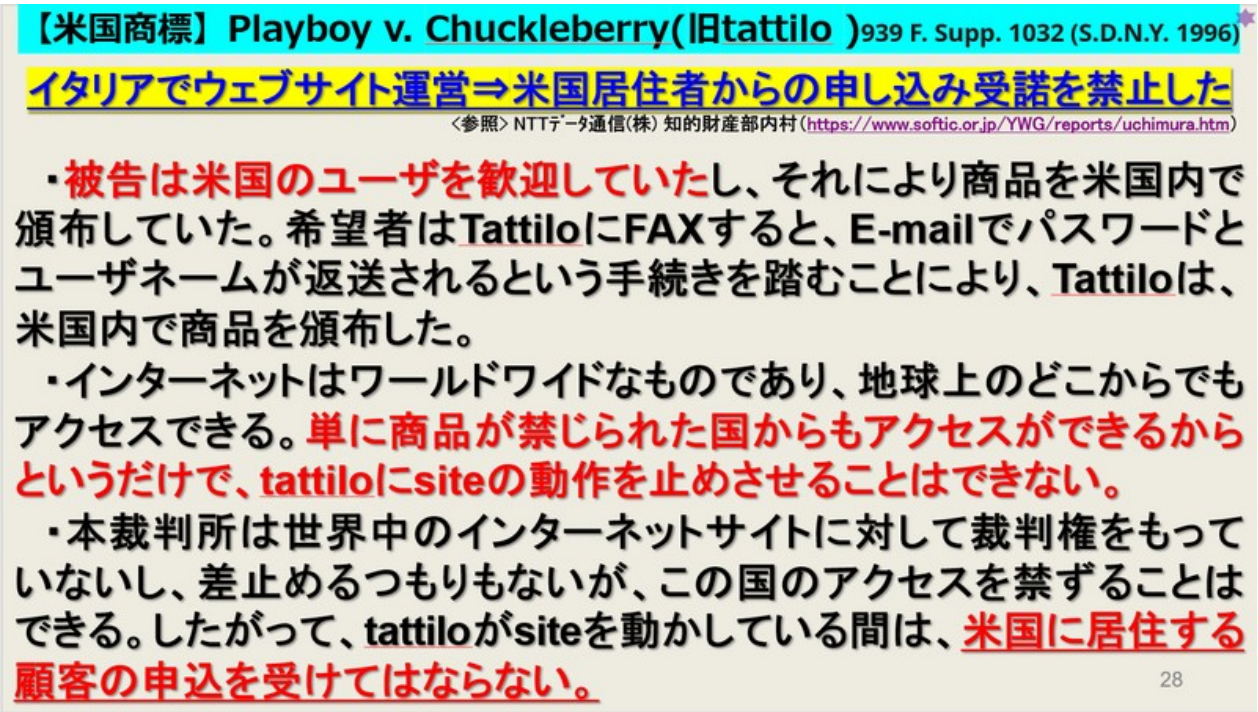
… When searching on Google, the search terms were set to “カバーダーム” [Coverderm] and “COVERDERM 化粧品” [COVERDERM cosmetics], and the settings were made to search Japanese-language pages.’

⇒ Even if the server is located abroad, sales directed to Japanese consumers were recognized as domestic use!!

[U.S. Trademarks] Playboy v. Chuckleberry — ⇛ Acceptance of new subscriptions from U.S. residents prohibited

Original Ameblo publication: 2023-02-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12789682291.html



[U.S. Trademarks] Playboy v. Chuckleberry (the order concerned defendant Tattilo Editrice), 939 F. Supp. 1032 (S.D.N.Y. 1996)

The defendant operated a website in Italy.

⇛ It was prohibited from accepting new subscriptions from U.S. residents.

‘Tattilo cannot be required to stop operating its site merely because the site is also accessible from a country in which its products are prohibited.’

https://www.softic.or.jp/YWG/reports/uchimura.htm

English translation of the image

[U.S. Trademarks] Playboy v. Chuckleberry (formerly Tattilo), 939 F. Supp. 1032 (S.D.N.Y. 1996)

Operation of a website in Italy ⇛ Acceptance of applications from U.S. residents prohibited.

The defendant welcomed U.S. users and thereby distributed products within the United States. Through a procedure under which an interested person sent a fax to Tattilo and received a password and username by email, Tattilo distributed products in the United States.

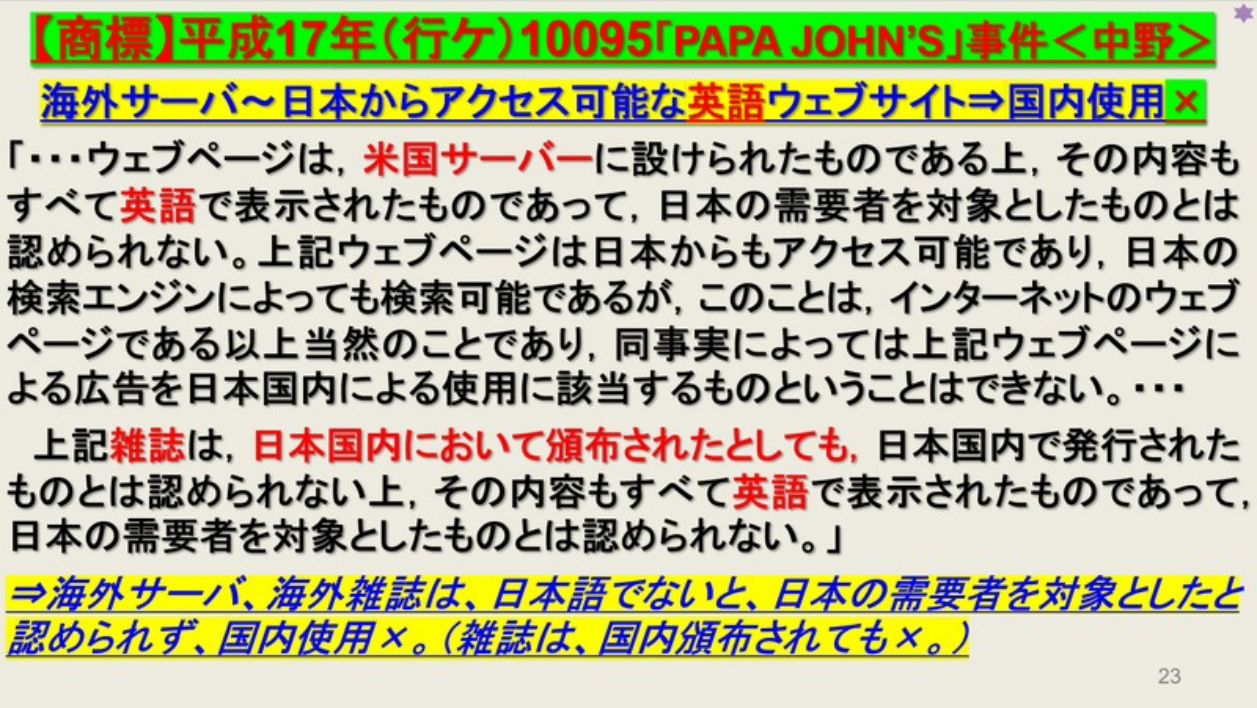
The Internet is worldwide and can be accessed from anywhere on Earth. Tattilo cannot be required to stop operating its site merely because it is accessible from a country in which its products are prohibited.

This court does not have jurisdiction over Internet sites throughout the world and does not intend to enjoin them, but it can prohibit access from this country. Therefore, while Tattilo operates the site, it must not accept applications from customers residing in the United States.

[Trademarks] IP High Court, 2005 (Gyo-Ke) 10095 ‘PAPA JOHN’S’ — ★Foreign server; English-language site not found to target Japanese consumers ⇒ Domestic use denied

Original Ameblo publication: 2023-02-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12789682616.html



[Trademarks] 2005 (Gyo-Ke) 10095, ‘PAPA JOHN’S’ case <Nakano>

★Foreign server — An ‘English-language’ website accessible from Japan — ‘Cannot be found to target Japanese consumers’ ⇒ Domestic use denied

★An ‘English-language’ magazine published abroad, even if distributed in Japan, ‘cannot be found to target Japanese consumers’ ⇒ Domestic use denied

(Note) The issue in this case was whether the website or magazine could be found to target Japanese consumers, rather than its language alone.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-9225.pdf

English translation of the image

[Trademarks] 2005 (Gyo-Ke) 10095 [PAPA JOHN’S] <Nakano>

Foreign server — English-language website accessible from Japan ⇒ Domestic use denied.

‘… The webpage was placed on a server in the United States, and all of its content was displayed in English; it cannot be found to have targeted Japanese consumers. The webpage was accessible from Japan and could also be found using Japanese search engines, but that is natural for an Internet webpage. Those circumstances do not make the advertising on the webpage use in Japan. … Even if the magazine was distributed in Japan, it cannot be found to have been published in Japan, and its content was all displayed in English; it cannot be found to have targeted Japanese consumers.’

⇒ In this case, the foreign-server webpage and foreign magazine were not found to target Japanese consumers, taking account of their language and the other circumstances; domestic use was denied. Domestic distribution of the magazine did not alter that conclusion.

[YouTube] Foreign-server issues (Are ‘providing’ a program and ‘transferring’ tangible goods parallel?)

Original Ameblo publication: 2023-02-17

[China (Article)] Reducing warranty liability risks in technology licensing to Chinese companies: Considering optimal structures for the business environment (2015, Intellectual Property Management)

Original Ameblo publication: 2023-02-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12790469198.html

[China (Article)] Reducing warranty liability risks in technology licensing to Chinese companies: Considering optimal structures for the business environment (FY2014 Licensing Committee 1, Subcommittee 2)

Under China's Regulations on Administration of Technology Import and Export as addressed in the article at the time, the licensor bore warranty obligations concerning the technology and the rights licensed.

⇒ Except in cases such as licensing to a Sino-Japanese joint venture, indirect licensing (through a Chinese-affiliated company located outside China) is useful!!

(Note) The 2019 amendment deleted the provision imposing liability on the transferor for infringement of third-party rights resulting from working the imported technology. The foregoing concerns the rules applicable at the time addressed by the article. Warranties concerning technical performance and liability for infringement of rights require separate consideration.

IP High Court, 2018 (Gyo-Ke) 10023 [Cushioning Material for Polishing] <Otaka>

Original Ameblo publication: 2023-02-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12790878168.html

2018 (Gyo-Ke) 10023 [Cushioning Material for Polishing] <Otaka>

Prosecution history estoppel ⇒ Correction not permitted

A deliberately excluded claim cannot be restored by correction.

⇒ Substantive change

‘The correction …contradicts the deletion of former Claims 5 and 6 during prosecution…. Permitting it … would risk unforeseen harm to third parties who consulted the prosecution history.’

(Excerpt from the court's reasoning)

The plaintiff, …after receiving a notice of reasons for refusal, …voluntarily deleted former Claims 5 and 6 by amendment, …and the patent was then allowed. It is therefore found to have expressed an intention to deliberately exclude the inventions of former Claims 5 and 6 from the scope of the patent….

Claims 3 and 4 after correction (Correction 2) effectively restore inventions including …the configurations of former Claims 5 and 6 deleted by the amendment. The correction corresponding to Correction 2 is therefore inconsistent with the deletion of former Claims 5 and 6 in the patent's prosecution history. Permitting it would risk unforeseen harm to third parties who consulted that history. …It substantively changes the scope of the claims….

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-88518.pdf

Tokyo District Court, 2017 (Wa) 35663 [Equol-Containing Fermented Soybean Hypocotyl Product] <Okinaka>

Original Ameblo publication: 2023-02-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12790878599.html

Tokyo District Court, 2017 (Wa) 35663 [Equol-Containing Fermented Soybean Hypocotyl Product] <Okinaka>

*Appeal: 2019 (Ne) 10015 <Otaka>

*In the divisional application in this case, claim language is construed consistently with arguments made during prosecution of the parent application.

Cf. Opposite to 2007 (Wa) 27187

‘Because this patent arises from a divisional of the parent application, “soybean hypocotyl” in the invention must likewise be understood in the same way as in the parent application.’

(Excerpt from the court's reasoning)

…The foregoing arguments by the plaintiff (applicant) during prosecution of the parent application are understood to assert that …‘soybean hypocotyl’ means ‘the soybean hypocotyl itself, containing components that inhibit fermentation,’ as distinct from ‘an extract of soybean hypocotyl (isoflavones, etc.).’ Because this patent arises from a divisional of the parent application, ‘soybean hypocotyl’ in the invention should likewise be understood in the same way as in the parent application. The plaintiff's foregoing arguments during prosecution of the parent application are consistent with, and substantiate, the explanation in (2) above….

The defendant's product is found to be …obtained by further fermenting high-purity isoflavone raw material—an extract taken from soybean hypocotyl—of which at least 90% consists of soybean isoflavones such as daidzin. Accordingly, ‘EQ-5’ contained in the defendant's product is a fermented soybean-hypocotyl extract, not a fermented product of the soybean hypocotyl itself, and therefore …does not fall within the technical scope of the invention….

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-88389.pdf

Tokyo District Court, 2007 (Wa) 27187 [User Interface for Television Program Listings]

Original Ameblo publication: 2023-02-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12790996305.html

Tokyo District Court, 2007 (Wa) 27187 [User Interface for Television Program Listings]

*In a divisional application, it is permissible to argue for a claim construction different from that in prosecution of the original application.

Cf. Opposite to 2017 (Wa) 35663

‘A divisional application …inherently concerns different subject matter…. Interpretation of the wording need not necessarily coincide with its interpretation in the proceedings for the original application.’

(Excerpt from the court's reasoning)

The divisional-application system allows an applicant who has sought patents for two or more different inventions in one application to divide the application and obtain patents for each invention, with each deemed filed retroactively at the original filing date. The inventions for which patents are sought in the original and divisional applications therefore inherently differ in subject matter. It must thus be said that interpretation of language in the ‘claims’ of the divisional invention need not necessarily coincide with interpretation of that language in the original application's proceedings.

Accordingly, even if the wording ‘television program listings’ in this patent is interpreted differently from the meaning of ‘television program listings’ used in the appeal against refusal of the original application and the action to revoke the JPO decision on the original application, that interpretation cannot be said to be impermissible under the doctrine of estoppel, and the defendant's contention cannot be accepted.

[U.S. Patents] August 2020, CAFC, IP Bridge v. TCL

Original Ameblo publication: 2023-03-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12791587077.html

[U.S. Patents] August 2020, CAFC, IP Bridge v. TCL

Whether the asserted claims are essential to a standard is a question of fact for the factfinder in the infringement proceedings, rather than a question of law resolved by the judge as part of claim construction. In this case, it was for the jury.

⇒ This affects the evidentiary strategy for proving whether a self-described SEP is truly standard-essential.

Cf.

Infringement — Question of fact

Novelty — Question of fact

Obviousness — Question of law based on questions of fact

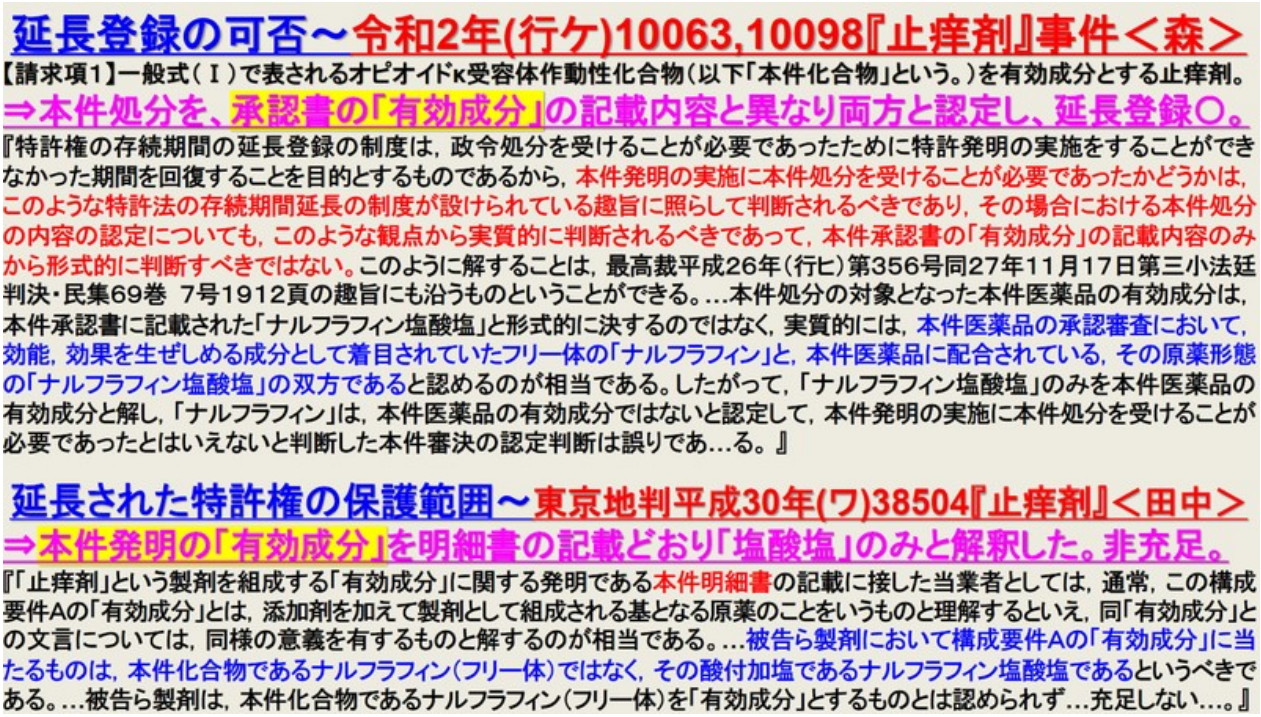
[Korean Patents] Patent Court judgment of February 17, 2022, 2020 Heo 5832

Original Ameblo publication: 2023-03-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12791744293.html

[Korean Patents] Patent Court judgment of February 17, 2022, 2020 Heo 5832



A compound patent extended under the doctrine of equivalents to a prodrug (a substance that undergoes a chemical change in the body to become a substance producing the pharmacological effect).

Although the claims were narrowed during prosecution, the prodrug was not deliberately excluded.

⇒ In contrast, Tokyo District Court, 2018 (Wa) 38504, the Antipruritic Agent case, rejected equivalence because the hydrochloride had been deleted during prosecution (deliberate exclusion).

http://www.central.kr/jp/sub04/index.php#

Japanese comparative cases: extension registration and the scope of protection of an extended patent right concerning an antipruritic agent

English translation of the image

Japanese comparative cases — Antipruritic Agent

Eligibility for registration of a patent-term extension — 2020 (Gyo-Ke) 10063 and 10098 [Antipruritic Agent] <Mori>

[Claim 1] An antipruritic agent having, as an active ingredient, an opioid receptor agonist compound represented by general formula (I) (hereinafter referred to as ‘the compound of the invention’).

⇒ The administrative disposition relating to the invention was assessed differently from the wording in the approval document's ‘active ingredient’ field, and extension registration was affirmed.

‘The system for registering extensions of the duration of patent rights is intended to restore the period during which the patented invention could not be worked because it was necessary to obtain an administrative disposition. Whether a disposition was necessary to work the invention must therefore be

determined in light of the purpose for which this special extension system was established. The content of the disposition must likewise be determined substantively from that perspective, and cannot be determined formally solely from the wording in the “active ingredient” field of the approval document. This interpretation also accords with the purpose of the Supreme Court First Petty Bench judgment of November 17, 2015, 2014 (Gyo-Hi) 356, Minshu Vol. 69, No. 7, p. 1912. … The active ingredients of the drug subject to the disposition should be understood substantively as both the free-form nalfurafine that was regarded in the approval review as the ingredient producing efficacy and effects, and nalfurafine hydrochloride, its raw material contained in the drug, rather than formally as only “nalfurafine hydrochloride” as written in the approval document. Accordingly, the JPO's determination was erroneous insofar as it identified only nalfurafine hydrochloride as the active ingredient, treated nalfurafine as not being an active ingredient, and determined that it was not necessary to obtain the disposition in order to work the invention.’

Scope of protection of the extended patent right — Tokyo District Court, 2018 (Wa) 38504 [Antipruritic Agent] <Tanaka>

⇒ The invention's ‘active ingredient’ was construed as the hydrochloride only, as stated in the specification. The claim limitation was not satisfied.

‘A person skilled in the art reading the specification's explanation of the “active ingredient” constituting the preparation called an “antipruritic agent” would ordinarily understand the “active ingredient” in limitation A as the raw material that forms the basis of the preparation, rather than the preparation to which additives have been added. It is appropriate to understand the same phrase in the same manner. … The substance in the defendant's preparation corresponding to the “active ingredient” in limitation A should be understood as nalfurafine hydrochloride, an acid-addition salt, rather than the free-form nalfurafine that is the compound of the invention. … The defendant's preparation cannot be found to have the free-form nalfurafine that is the compound of the invention as its active ingredient … [the claim limitation is not satisfied].’

[U.S. Patents] March 2016, CAFC, DSS v. Taiwan Semiconductor

Even if the independent claim is construed narrowly, the dependent claim remains narrower still; thus claim differentiation (related provision: 35 U.S.C. §112(d)) is not violated.

⇒ Place features and the like that you do not want read into the independent claim as limitations into dependent claims!!

=In Japan too: Tokyo District Court, 2010 (Wa) 26341 <Osuga>

DSSvTSM.pdf (jpaa.or.jp)

Japanese comparative case: independent and dependent claims for an oil-based liquid cleansing composition

English translation of the image

Japanese comparative case — Tokyo District Court, 2010 (Wa) 26341 [Oil-Based Liquid Cleansing Composition] <Osuga>

Independent claim, Claim 1: '… an oil-based liquid cleansing composition' (no transmittance value specified). Dependent Claim 2: 'transmittance of light at a wavelength of 750 nm of 75% or more.' Dependent Claim 3: 'viscosity … 300–1,000 mPa·s.'

'The invention of Claim 1 (Invention 1) is described as achieving the above general effects common to Claims 1 to 5: providing an oil-based liquid cleansing composition that can be used when the hands or face are wet, is transparent, and has viscosity giving an excellent feeling in use. The above effects are not identical to the higher effects specified by concrete numerical values in Claims 2 and 3, but are understood to be satisfied by a lower level. … The specification contains no concrete statement concerning the

“transparency” involved in the effects of Invention 1, and therefore the transparency referred to above should be understood as satisfied if the oil-based liquid cleansing composition is “transparent” in practical use.’ ⇒ The transparency limitation was satisfied.

*So-called claim differentiation was established. By specifying numerical values in dependent claims, the reasoning can be sustained that even if effects relating to those values are required in the independent claim, those effects may be of a lower level than the values specified in the dependent claims!!

[U.S. Patents] 2021, U.S. Supreme Court, Minerva v. Hologic

‘Assignor estoppel’ is limited, for example, in the following circumstances.

(1) The assignment took place before the inventor could possibly warrant validity (e.g., an assignment under an employment agreement).

(2) A subsequent change in law rendered the warranty at assignment meaningless.

(3) After assignment, the patent claims were changed so that they became materially broader than the claims at the time of assignment.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12792546801.html

[U.S. Patents] January 2021, CAFC, SIMO v. Hong Kong uCloudlink

Where the claim language is expressed schematically as ‘a plurality of A, B, C, D and E,’ the court required a plurality of each of A, B, C, D, and E.

⇒ Claim limitation not satisfied

If ‘a plurality of’ did not modify ‘E,’ the indefinite article ‘a’ would have preceded ‘E.’

https://www.fukamipat.gr.jp/region_ip/5976/

[U.S. Patents] February 2004, CAFC, SuperGuide v. DirecTV Enters.

Where the claim language is expressed schematically as ‘at least one of A, B, C, D and E,’ the court required at least one item from each listed category.

⇒ Claim limitation not satisfied

The specification provides no support for selecting just one.

Enforcement based on an unsupported claim construction was rejected.

⇒ ‘Comprises at least one of A, B and C’ is construed as ‘Comprises at least one of A, at least one of B and at least one of C.’

‘And’ should be changed to ‘or.’

Comprises at least one selected from the group consisting of A, B and C

would be acceptable.

(Note) These are drafting proposals, and the construction is not determined uniformly by them. The listed items, grammar, and the specification must be considered.

Osaka District Court, 2015 (Wa) 8974 [Apparatus Displaying a … Ladder Circuit] — Admitting facts does not establish a judicial admission of satisfaction of a claim limitation

Original Ameblo publication: 2023-03-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12794094128.html

Osaka District Court, 2015 (Wa) 8974 [Apparatus Displaying a Ladder Circuit When … an Abnormality Occurs]

*Admitting facts does not establish a judicial admission of satisfaction of a claim limitation.

‘The defendant merely admitted …that a search target can be specified by touching an input/output element…. It cannot be found that a judicial admission extending to satisfaction of the claim limitation had been established.’

(Excerpt from the court's reasoning)

The defendant merely admitted that, including for Defendant's Display 2A, a search target can be specified by touching an input/output element; …whether this satisfies Claim Element 1F is a question of interpretation. Moreover, because the defendant disputed satisfaction of Claim Element 1F itself (…), it cannot be found that a judicial admission had been established extending beyond the fact that Defendant's Display A is configured so that an input/output element is touched when searching for an input/output element in a ladder circuit, to satisfaction of that claim element itself.

IP High Court (Grand Panel), 2016 (Ne) 10046 [Elplat Case] ⇒ Petition for acceptance of final appeal not accepted

After holding that the Japanese claim wording ‘kara naru’ (translated here as ‘consisting of’) could, from the claims themselves, be read either as including or as excluding other components such as additives, the court construed it as ‘consisting only of.’

⇒ Claim limitation not satisfied

=Cases restricting ‘consisting of’ to ‘only’: 1999 (Wa) 3012, 2002 (Wa) 25697, 2008 (Wa) 10196

Cf. A case not restricting ‘consisting of’ to ‘only’: 2012 (Wa) 15621

(Excerpt from the court's reasoning)

…Claim Element C, ‘consisting of an aqueous solution of oxaliplatinum,’ can, from the claim wording itself, be construed either as an aqueous solution consisting only of oxaliplatinum and water or as merely requiring an aqueous solution of oxaliplatinum and water while also encompassing other components such as additives. Claim Element C must therefore be determined by reference to the specification and prosecution history…. The problem addressed by the invention is to obtain a ready-to-use oxaliplatinum injection solution of the known active ingredient ‘oxaliplatinum’ that remains pharmaceutically stable for an acceptable period under approved standards and exhibits chemical purity and therapeutic activity equivalent to those of a solution obtained from a lyophilized product; the invention presents …the means of solving that problem…. It means that the invention is an aqueous solution consisting only of oxaliplatinum and water, without other components such as additives….

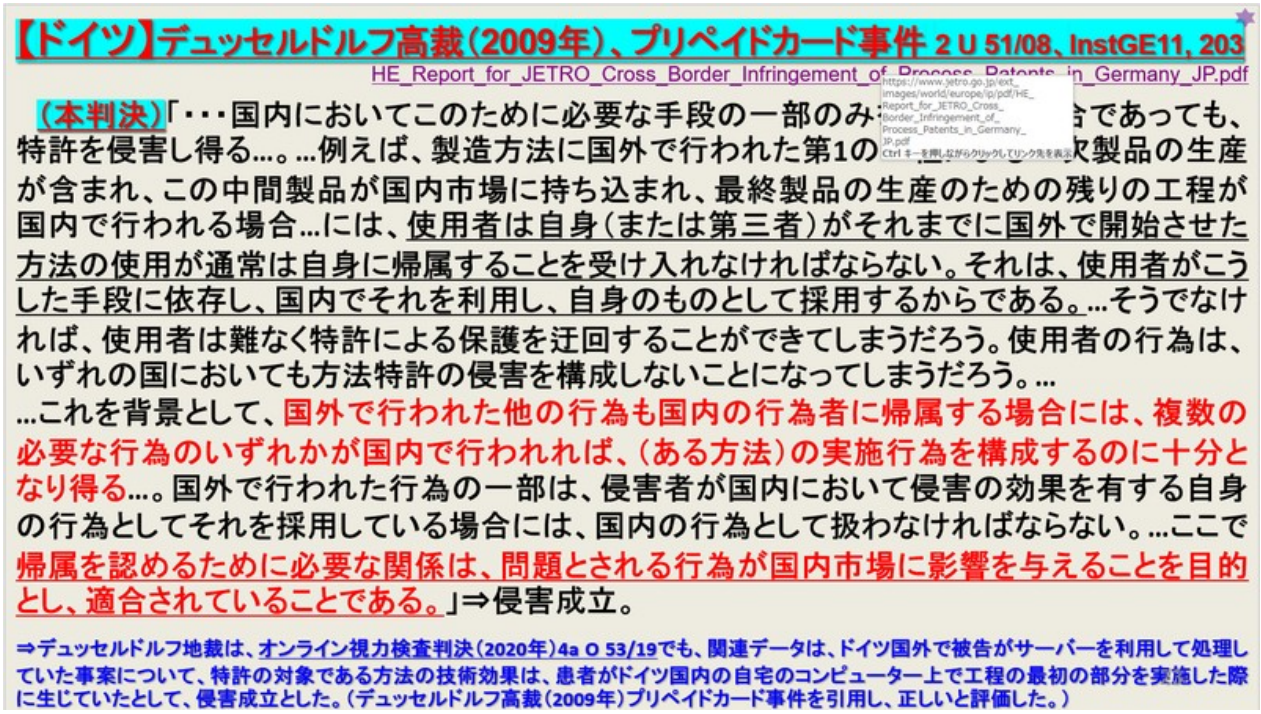
[Germany] Düsseldorf Higher Regional Court (2009), ‘Prepaid Card’ case

Original Ameblo publication: 2023-03-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12794546504.html



[Germany] Düsseldorf Higher Regional Court (2009), ‘Prepaid Card’ case, 2 U 51/08, InstGE 11, 203

(This judgment) ‘…A patent may be infringed even where only some of the measures necessary for this purpose are carried out domestically…. …For example, where a manufacturing process includes production of a primary product through a first step carried out abroad, that intermediate product is brought into the domestic market, and the remaining steps for producing the final product are performed domestically…, the user must normally accept attribution to itself of the use of the process previously initiated abroad by itself (or a third party). This is because the user relies on those measures, utilizes them domestically, and adopts them as its own. …Otherwise, the user could readily circumvent patent protection. The user's conduct would not constitute infringement of the process patent in any country….

…Against this background, where other acts performed abroad are also attributable to the domestic actor, performance of any one of several necessary acts domestically may suffice to constitute working (of a process)…. Some acts performed abroad must be treated as domestic acts where the infringer adopts them as its own acts having an infringing effect domestically. …The connection necessary for attribution here is that the acts in question are intended and adapted to affect the domestic market.’ ⇒ Infringement established.

⇒ In the Online Eye Test judgment (2020), 4a O 53/19, the Düsseldorf Regional Court likewise found infringement in a case where the defendant processed the relevant data using a server outside Germany. The court held that the technical effect of the patented method arose when patients performed the first part of the steps on their home computers in Germany. (It cited and endorsed the Düsseldorf Higher Regional Court's 2009 Prepaid Card judgment.)

https://www.jetro.go.jp/ext_images/world/europe/ip/pdf/HE_Report_for_JETRO_Cross_Border_Infringement_of_Process_Patents_in_Germany_JP.pdf

English translation of the image

[Germany] Düsseldorf Higher Regional Court (2009), Prepaid Card case, 2 U 51/08, InstGE 11, 203

[Judgment] '… A patent is infringed even if only some of the steps necessary for that purpose are performed in the country. … For example, where a manufacturing process includes production of an intermediate product performed abroad, the intermediate product is brought onto the domestic market, and the remaining steps for production of the final product are performed in the country, … the user must normally accept attribution to itself of the use of the process that it (or a third party) had begun abroad. That is because the user uses the obtained means, takes advantage of them in the country, and adopts them as its own. … Otherwise, the user could evade patent protection without difficulty. The user's conduct would not constitute infringement of the method patent in any country. … Against that background, where other acts performed abroad are also attributable to a domestic actor, performance of any one of the several necessary acts within the country may be sufficient to constitute working of a method. … Some acts performed abroad must be treated as domestic acts where the infringer adopts them as its own acts having an infringing effect within the country. … The causal relationship necessary to recognize attribution here is that the conduct at issue is directed and suited to affecting the domestic market.' ⇒ Infringement established.

⇒ In its Online Eyesight Test judgment (2020), 4a O 53/19, the Düsseldorf Regional Court also held that the technical effect of the patented method arose when the patient performed the first part of the process on a computer at home in Germany, in a case in which relevant data were processed in the Netherlands using a server managed by the defendant in Germany, and found infringement. It cited and correctly evaluated the Düsseldorf Higher Regional Court's 2009 Prepaid Card case.

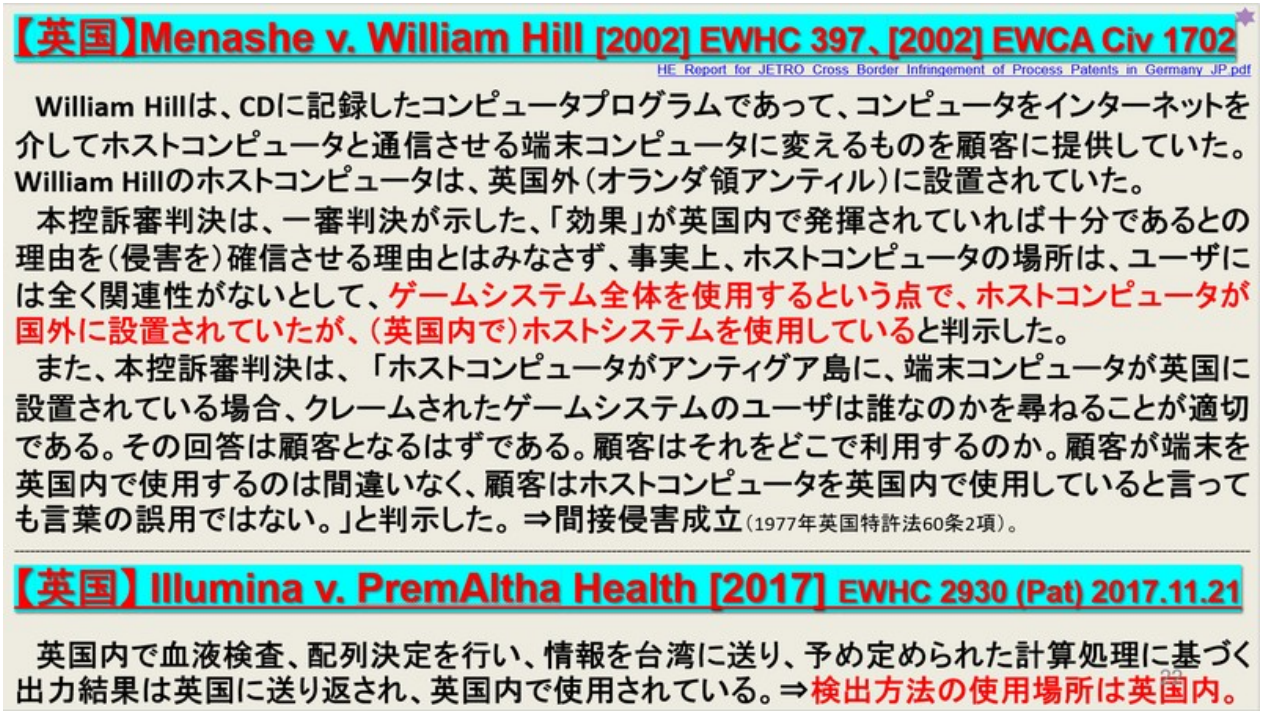
[United Kingdom] EWHC [2002], Menashe v. William Hill

Original Ameblo publication: 2023-03-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12794546846.html

[United Kingdom] Menashe v. William Hill, [2002] EWHC 397, [2002] EWCA Civ 1702

William Hill provided customers with computer programs recorded on CDs that converted their computers into terminal computers communicating with a host computer over the internet. William Hill's host computer was located outside the United Kingdom (in the Netherlands Antilles).



The appellate judgment did not regard the first-instance reasoning—that it was sufficient for the ‘effect’ to occur in the United Kingdom—as a convincing reason for finding infringement. Rather, it held that the host computer's location was, in practical terms, entirely irrelevant to the user: in using the gaming system as a whole, the user used the host system (in the United Kingdom) even though the host computer was located abroad.

The appellate judgment also held: ‘Where the host computer is located in Antigua and the terminal computer in the United Kingdom, it is appropriate to ask who uses the claimed gaming system. The answer must be the customer. Where does the customer use it? There is no doubt that the customer uses the terminal in the United Kingdom, and it is not a misuse of language to say that the customer uses the host computer in the United Kingdom.’ ⇒ The foreign-host defense was rejected; liability for indirect infringement could arise under Section 60(2) of the UK Patents Act 1977.

[United Kingdom] Illumina v. Premaitha Health, [2017] EWHC 2930 (Pat), November 21, 2017

Under the proposed alternative process, blood testing and sequencing would be performed in the United Kingdom, information would be sent to Taiwan, and the output from predetermined computational processing would be sent back to and used in the United Kingdom. ⇒ The court held that, in substance, this process would be used in the United Kingdom.

https://www.jetro.go.jp/ext_images/world/europe/ip/pdf/HE_Report_for_JETRO_Cross_Border_Infringement_of_Process_Patents_in_Germany_JP.pdf

English translation of the image

[United Kingdom] Menashe v. William Hill [2002] EWHC 397; [2002] EWCA Civ 1702

William Hill supplied customers with a computer program recorded on a CD that turned their computers into terminal computers communicating with a host computer over the Internet. William Hill's host computer was located outside the United Kingdom, in the Netherlands Antilles.

The appellate judgment did not accept the first-instance court's reasoning that it was sufficient for the ‘effect’ to arise in the United Kingdom as a basis for finding infringement. Rather, the location of the host computer was entirely irrelevant to the user; from the perspective of using the gaming system as a whole, the host computer was being used in the United Kingdom even though it was installed abroad.

The appellate judgment also stated: ‘If the host computer is installed in Antigua and the terminal computer in the United Kingdom, it is appropriate to ask who the user of the claimed gaming system is. The answer can only be the customer. What does the customer use it for? There is no doubt that the customer uses the terminal in the United Kingdom, and saying that the customer uses the host computer in the United Kingdom is not an abuse of language.’ ⇒ Indirect infringement established (Patents Act 1977, section 60(2)).

[United Kingdom] Illumina v. Premaitha Health [2017] EWHC 2930 (Pat), November 21, 2017

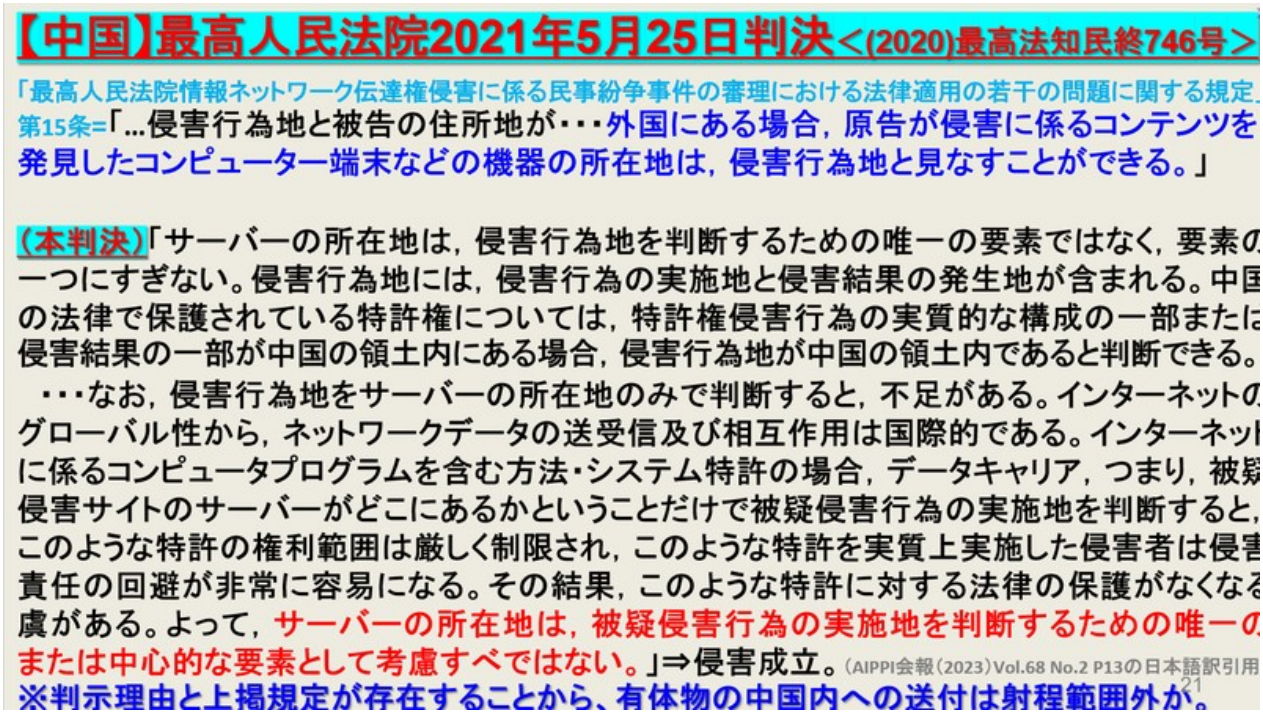
Blood testing and sequencing were performed in the United Kingdom; information was sent to Taiwan, and output based on predetermined computational processing was sent back to the United Kingdom and used there. ⇒ The detection method was used within the United Kingdom.

[China] Supreme People's Court judgment of May 25, 2021 <(2020) Zui Gao Fa Zhi Min Zhong No. 746>

Original Ameblo publication: 2023-03-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12794547611.html

[China] Supreme People's Court judgment of May 25, 2021 <(2020) Zui Gao Fa Zhi Min Zhong No. 746>



Article 15 of the ‘Supreme People's Court Provisions on Several Issues Concerning the Application of Law in the Trial of Civil Disputes Involving Infringement of the Right of Communication through Information Networks’

=‘…Where the place of infringement and the defendant's domicile are …abroad, the location of equipment such as the computer terminal on which the plaintiff discovered the infringing content may be deemed the place of infringement.’

(This judgment) ‘The location of the server is not the sole factor for determining the place of infringement, but only one factor. The place of infringement includes both the place where the infringing acts are carried out and the place where the consequences of infringement occur. For patent rights protected by Chinese law, where part of the substantive elements of the patent-infringing acts or part of their consequences lies within Chinese territory, the place of infringement may be determined to be within Chinese territory.

…Moreover, determining the place of infringement solely by the location of the server is inadequate. Given the global nature of the internet, transmission, reception, and interaction of network data are international. For method and system patents involving computer programs related to the internet, determining the place of the alleged infringing acts solely by the data carrier—that is, the location of the server of the allegedly infringing website—would severely restrict the scope of such patents and make it extremely easy for infringers who substantially work them to evade liability. As a result, such patents could effectively lose legal protection. Accordingly, the server's location should not be considered the sole or central factor in determining the place where the alleged infringing acts are carried out.’ ⇒ Infringement established. (English translation of the Japanese quotation in AIPPI Journal (2023), Vol. 68, No. 2, pp. 20–23 (issue pagination).)

*In view of the reasoning and the existence of the provision quoted above, might shipment of tangible goods into China fall outside its reach?

English translation of the image

[China] Supreme People's Court judgment of May 25, 2021, (2020) Zui Gao Fa Zhi Min Zhong No. 746

Article 15 of the Provisions of the Supreme People's Court on Several Issues Concerning the Application of Law in the Trial of Civil Dispute Cases Involving Infringement of the Right of Communication through Information Networks: '… If the place of infringement and the defendant's domicile are … abroad, the location of equipment such as a computer terminal on which the plaintiff discovered the infringing content may be regarded as the place of infringement.'

[Judgment] 'The location of the server is not the sole factor for determining the place of infringement, but only one factor. The place of infringement includes the place where the infringing act is performed and the place where its result occurs. For patent rights protected under Chinese law, where part of the substantive composition of the patent-infringing act or part of its result is within Chinese territory, the place of infringement may be determined to be within Chinese territory. … Determining the place of infringement solely by the location of the server is insufficient. Because the Internet is global, the transmission, reception, and interaction of network data are international. For method and system patents including computer programs relating to the Internet, determining where the accused infringing act is performed solely by the location of the data carrier, namely the accused infringing website's server, would severely restrict the scope of such patent rights and make it extremely easy for an infringer who substantially works such a patent to evade liability. As a result, legal protection of such patents might be lost. The location of the server should not be considered the sole or central factor for determining where the accused infringing act is performed.' ⇒ Infringement established. (Quoted from the Japanese translation in AIPPI Journal (2023), Vol. 68, No. 2, p. 13.)

*In view of the reasoning and the existence of the above provision, is sending tangible goods into China outside the scope of the decision?

[Korea] Seoul Central District Court, September 7, 2007 <2006 Gahap 73442>

≈ Seoul Central District Court, February 17, 2015 <2013 Gahap 546931>

(This judgment) In a case where the defendant, the Korean subsidiary of a foreign company, provided services in Korea using a server located abroad and owned by the foreign company: '…Considering (i) that the services offered through the defendant's website are in Korean and thus principally target domestic nationals; (ii) that the defendant registers with the National Internet Development Agency of Korea and holds the defendant's domain name, the internet address of its website; (iii) that the defendant takes the leading role domestically in publicity, marketing, sales of advertising to be placed on the website, technological development, and other work related to its website, and profits from those activities; and (iv) that the services at issue, by providing convenience to users of the defendant's website, aim to increase users of all services offered through the website and ultimately to increase advertising revenue and the like, and are thus closely related to the defendant's activities concerning its website, it is appropriate to find that the defendant "uses domestically" the services at issue offered through its website, …' ⇒ Domestic use was found. However, the infringement injunction claim in that case was dismissed as an abuse of rights because the invention lacked novelty. (English translation of the Japanese quotation in AIPPI Journal (2023), Vol. 68, No. 2, p. 14 (cumulative p. 128).)

*Compared with requirements (i)–(iv) in the IP High Court judgment in Japan's earlier Dwango litigation (2018 (Ne) 10077), these requirements are not necessarily met merely because services are provided from a foreign server to domestic users.

Both cases involved a domestic company: the defendant in the Korean case was a Korean company, and defendant HPS Co., Ltd. in the Dwango litigation was a Japanese company.

English translation of the image

[Korea] Seoul Central District Court, September 7, 2007, 2006 Gahap 73442; also Seoul Central District Court, February 17, 2015, 2013 Gahap 546931

[Judgment] In a case in which the defendant, the Korean subsidiary of a foreign company, provided services in Korea using a server owned by the foreign company and located abroad: '… Taking account of (1) the fact that the service supplied through the defendant's website is provided in Korean and thus primarily targets domestic users; (2) the fact that the defendant has registered and holds the defendant's domain name, the address of its website on the Internet, with the Korea Internet & Security Agency; (3) the fact that the defendant takes the lead in domestic public relations, marketing, sales of advertising placed on the website, and technology development relating to its website and derives profits from them; and (4) the fact that the service at issue provides convenience to users of the defendant's website, thereby increasing the users of all services supplied through the website and ultimately aiming at increased advertising revenue and the like, and thus is closely related to the defendant's business concerning its website, the defendant is found to use domestically the service at issue supplied through its website.' ⇒ Infringement established. (Quoted from the Japanese translation in AIPPI Journal (2023), Vol. 68, No. 2, p. 22.)

*Compared with requirements (1)–(4) in the IP High Court judgment in Japan's first Dwango action, 2018 (Ne) 10077, provision of a service from a foreign server to domestic users does not necessarily satisfy these circumstances. The fact that the actor is a Korean company is also common to defendant HPS Inc. in the Dwango action.

IP High Court, 2021 (Gyo-Ke) 10090 [Spray Product and Spraying Method] <Otaka>

Original Ameblo publication: 2023-03-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12794793273.html

2021 (Gyo-Ke) 10090 [Spray Product and Spraying Method] <Otaka>

Merely reciting the functions and effects achieved by a configuration does not narrow the claim. ⇒ Correction requirements not satisfied

‘Because it merely recites the functions and effects achieved by the configuration, …it cannot be found to narrow the claims.’

(Excerpt from the court's reasoning)

Correction 1 …changes ‘spray product’ to ‘spray product with reduced irritation to mucous membranes,’ and Correction 2 …changes ‘spraying method’ to ‘spraying method that reduces irritation to mucous membranes.’ They therefore …add, respectively, the functional descriptions ‘with reduced irritation to mucous membranes’ and ‘that reduces irritation to mucous membranes’ to the descriptions of the ‘spray product’ and …‘spraying method’….

The specification neither states nor suggests that there may be cases in which the foregoing configurations of Claims 1 and 3 before correction do not achieve the function and effect of ‘reducing irritation to mucous membranes.’ Accordingly, the functional descriptions ‘with reduced irritation to mucous membranes’ and ‘that reduces irritation to mucous membranes’ added by Corrections 1 and 2 merely recite the functions and effects achieved by the foregoing configurations of Claims 1 and 3 before correction. Corrections 1 and 2 therefore cannot be found to narrow the claims for the respective inventions of Claims 1 and 3 before correction. …Consequently, Corrections 1 and 2 cannot be found to have the purpose of ‘narrowing the claims’….

[Contracts / Contractual Penalty] Osaka District Court, 2021 (Wa) 4467 — In this case, the penalty was valid only up to an amount equal to the damages

Original Ameblo publication: 2023-03-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12794861773.html

[Contracts / Contractual Penalty] Osaka District Court, 2021 (Wa) 4467

Imitation of configuration ⇒ Notice ⇒ Copying from the original found

Knowledge of the ‘imitation’ at importation was found.

A contractual penalty of ¥20 million had been stipulated at the previous infringement/settlement.

⇒ Stipulating ¥20 million did not, by itself, make the penalty invalid.

⇒ An excessive amount grossly disproportionate to the damage violates public policy.

⇒ In this case, valid only to the extent of a contractual penalty equal to the damages excluding attorney fees.

Osaka District Court, 2022 (Wa) 3374 [Method of Controlling Microbial Growth] <Matsuami>

Original Ameblo publication: 2023-03-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12795366136.html

Osaka District Court, 2022 (Wa) 3374 [Method of Controlling Microbial Growth] <Matsuami>

The court required a ‘direct relationship’ between blue-light ‘irradiation’ and ‘suppression of microbial growth.’

⇒ Claim limitation not satisfied (insufficient proof; the growth suppression could have resulted from low temperature rather than blue light).

‘[Claim element] …A method …of culturing under irradiation with light in a wavelength region from approximately 400 nm to 490 nm to suppress the growth of the microorganism…’

(Excerpt from the court's reasoning)

…In light of the literal meaning of ‘under irradiation with light,’ the claims of the patent and the specification, and the plaintiff's argument that ‘under irradiation with light’ means that microorganisms such as Bacillus subtilis and Staphylococcus aureus are irradiated with blue light that suppresses their growth, it is appropriate to construe ‘under irradiation with light’ in Claim Element B as requiring that microbial growth be suppressed by the effects of blue-light irradiation (that there be a direct relationship between blue-light irradiation and suppression of microbial growth)…. …

LED (5), the principal blue-light source, emits blue light when the partial-freezing compartment is in the slightly frozen partial-freezing state (rather than chilled) and automatic rapid cooling is underway. In that case, the compartment is maintained at approximately −3°C to −1°C. This is consistent with the results of the respective experiments in Exhibits Otsu 12–15 showing that some of the culture medium and the pork were frozen. The absence of Staphylococcus aureus and Bacillus subtilis colonies in the experiments in Exhibits Otsu 12 and 13 is also consistent with the general growth-temperature range of Staphylococcus aureus being 5–47.8°C (optimal growth temperature: 30–37°C), and that of Bacillus subtilis being 5–55°C (optimal growth-temperature range: 20–45°C) (reference materials attached to Exhibits Otsu 12 and 13)….

There is insufficient evidence to find that the product at issue …suppresses microbial growth through the effects of blue-light irradiation (that there is a direct relationship between irradiation and suppression of microbial growth). Accordingly, the method of using the product does not satisfy ‘under irradiation with light’ (Claim Element B) and does not fall within the technical scope of the invention.

2021 (Gyo-Ke) 10164 [Conductive Member Using a Copper–Silver Alloy…] <Honda>

*A new reference in the appeal decision ⇒ Procedural violation

‘…The reference was not identified at the examination stage, nor identified in advance during the appeal proceedings, but was first identified in the appeal decision…. …This is impermissible from the perspective of the plaintiff's procedural safeguards….’

(Excerpt from the court's reasoning)

Exhibit Ko 16 (Cited Reference 5) was not identified at the examination stage, nor identified in advance during the appeal proceedings, but was first identified in the appeal decision…. …Had Exhibit Ko 16 (Cited Reference 5) been identified in a notice of reasons for refusal, …it would have had a significant impact on the plaintiff's course of action…. …Assessing the inventive step of the amended invention using Cited Invention 5 as the primary reference must be regarded as impermissible from the perspective of the plaintiff's procedural safeguards.

[Japan / Criminal Law] Supreme Court decisions, November 25, 2014 — 2013 (A) 574 <Shukei, No. 315, p. 187>; 2013 (A) 510 <Keishu, Vol. 68, No. 9, p. 1053>

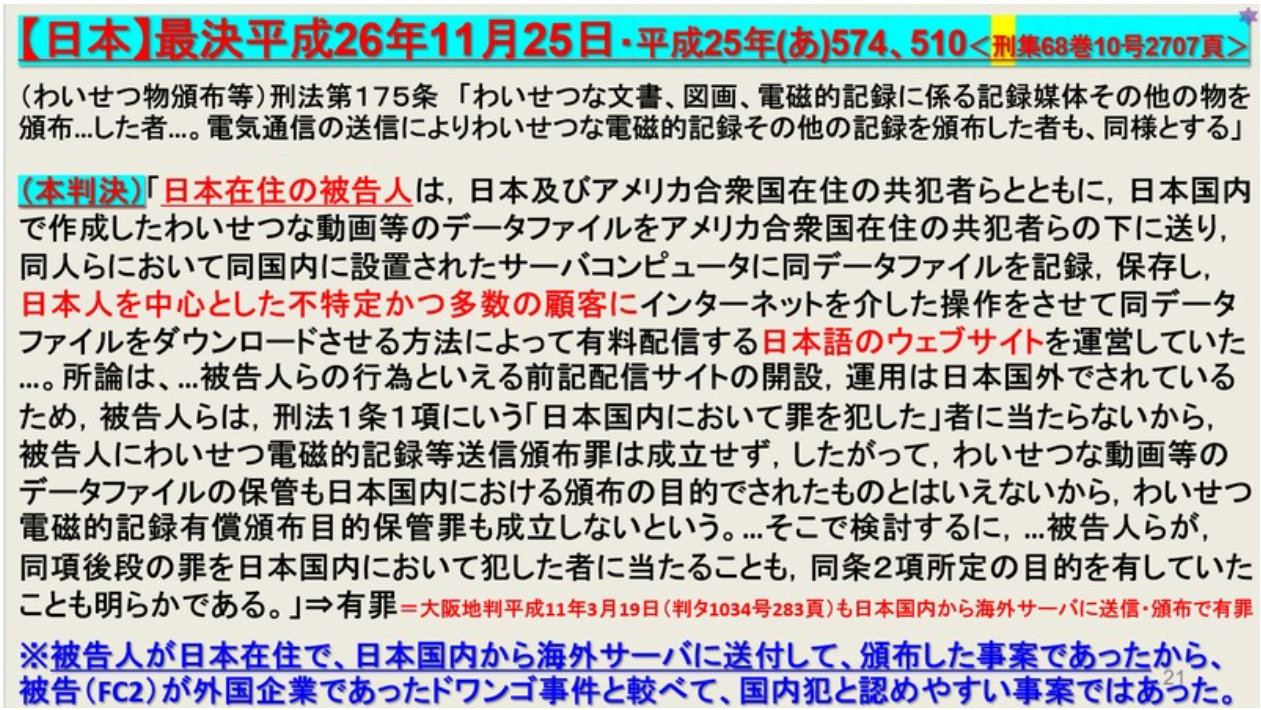
Defendants residing in Japan

Transmitted obscene images created in Japan to an overseas server

Distributed them to an unspecified and large number of customers, mainly Japanese

Operated a Japanese-language website



⇒ Persons who ‘committed an offense within Japan’

⇒ Guilty

*Because the defendants resided in Japan and transmitted the images from Japan to an overseas server for distribution, this was a case in which a domestic offense was more readily recognized than in the Dwango case, where the defendant (FC2) was a foreign company.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-84650.pdf

Correction to the image heading: 2013 (A) 574 is reported in Shukei No. 315, p. 187; 2013 (A) 510 is reported in Keishu Vol. 68, No. 9, p. 1053. Both are decisions of the Supreme Court, Third Petty Bench, dated November 25, 2014.

English translation of the image

[Japan] Supreme Court decisions of November 25, 2014 — 2013 (A) 574, Shukei No. 315, p. 187; 2013 (A) 510, Keishu Vol. 68, No. 9, p. 1053

Penal Code, Article 175 (Distribution of Obscene Objects, etc.): ‘A person who distributes … obscene documents, drawings, recording media containing electronic or magnetic records, or other objects … The same applies to a person who distributes obscene electronic or magnetic records or other records by transmission through telecommunications.’

[Decision] ‘The defendant residing in Japan, together with accomplices residing in Japan and the United States, sent data files of obscene videos and the like created in Japan to accomplices in the United States, who recorded and stored those files on server computers installed there. They operated a Japanese-language website that distributed the files for a fee by having an unspecified and large number of customers, mainly Japanese, perform operations over the Internet to download them. … The argument is … that because the establishment and operation of the distribution website that can be attributed to the defendants were performed outside Japan, the defendants were not persons who “committed an offense within Japan” under Article 1(1) of the Penal Code; the offense of distribution of obscene electronic or magnetic records by transmission therefore was not established, and consequently storage of the data files of obscene videos and the like was not for the purpose of distribution within Japan, so the offense of possession of obscene electronic or magnetic records for the purpose of distribution for a fee also was not established. … Upon examination … it is clear both that the defendants were persons who committed the offense under the latter sentence of that paragraph within Japan and that they had the purpose specified in paragraph (2) of that article.’ ⇒ Guilty.

The Osaka District Court judgment of March 19, 2015 (Hanji No. 2348, p. 28) also found guilt where transmission and distribution were performed from Japan to an overseas server.

*Because the defendants resided in Japan and sent the files from Japan to an overseas server for distribution, this was a case in which a domestic offense was more readily recognized than in the Dwango case, where the defendant (FC2) was a foreign company.

Original Ameblo publication: 2023-03-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12795877464.html

2020 (Ne) 10042 [Vehicle Guidance System] <Honda>

*Claim limitations held satisfied on appeal, reversing the first-instance finding!!

*The ‘Problem’ and ‘Effects’ sections of the specification contain statements overstated relative to Claim 1 of the parent application.

⇒ Both the judgment below and the appellate judgment construed the claims restrictively in light of the problem/effects, but the appellate court adopted a broader interpretation.

‘Guidance means’ does not exclude manual intervention by an attendant.

(Excerpt from the court's reasoning)

The inventions produce Function and Effect 1 (providing a vehicle guidance system that safely guides vehicles even where an ordinary vehicle enters an entrance/exit for ETC-equipped vehicles, or the ETC system fails to operate normally for an ETC-equipped vehicle). Function and Effect 1 is achieved if data received by the ‘communication means’ from the vehicle's ETC unit are used to determine whether ETC toll collection is possible and the barriers operate at appropriate times so that the vehicle can be guided safely. That function and effect can be achieved whether the ‘communication means’ receive the data from the ETC unit before or after the vehicle passes the first barrier. Turning to Function and Effect 2 (providing a safe vehicle guidance system using an ETC system that prevents wrong-way driving or avoids collisions between preceding and following vehicles), the ‘wrong-way vehicles’ in the inventions include vehicles entering an ETC lane against the permitted direction of traffic through the exit of that lane or the exit of a departure lane, for purposes such as avoiding toll payment. It is clear that preventing such wrong-way driving has no relationship to the relative positions of the ‘communication means’ and ‘first barrier.’ Moreover, regardless of the position of the communication means, lowering the first barrier after the vehicle has passed it prevents wrong-way travel by reversing. …Accordingly, the problem and functions and effects of the inventions do not specify the relative positions of the ‘communication means’ and ‘first barrier’ as the appellee argues….

The claims do not state that the ‘guidance means for guiding to the second lane’ provide automatic guidance, and the specification does not exclude an attendant's involvement in the ‘guidance means.’ In the appellee's systems, although departure-control devices [barriers] (1) and (5) are opened by human operation, there is no need to summon an attendant to the site by intercom. Furthermore, opening those devices allows the vehicle to advance toward the second lane, eliminating the risk that it will try to leave the lane by reversing. The systems can therefore solve the problems addressed by the inventions—‘the need to summon an attendant by intercom exacerbates congestion’ and ‘attempting to leave by reversing creates a danger of collision with following vehicles’—and can achieve the functions and effects of ‘providing a vehicle guidance system that safely guides vehicles’ and ‘providing a safe vehicle guidance system capable of avoiding collisions between preceding and following vehicles.’ The inventions themselves also contemplate that a vehicle may stop before the first barrier…. Accordingly, there is no reason to construe the ‘guidance means for guiding to the second lane’ restrictively as the appellee argues, and that argument cannot be accepted.

[Copyright] Osaka District Court, 2020 (Wa) 9992 — ‘Original artwork claimed to be a copyrightable artistic work,’ but copyrightability denied

Original Ameblo publication: 2023-03-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12796033617.html

[Copyright] Osaka District Court, 2020 (Wa) 9992

The clock’s original artwork is applied art ⇒ Copyrightability denied because no aesthetic features separable from its practical function were found

The plaintiff argued that the clock’s original artwork could be protected as an artistic work even if it was applied art, provided that it also had the nature of fine art. In light of factors including the mass production and sale of clocks commercialized from the artwork, the court held that ‘the original artwork at issue was created for practical use and constitutes so-called applied art.’ It then denied copyrightability because it found no aesthetic features that could be appreciated as art separately from the practical function.

Copyrightability denied

[YouTube: Introducing One Case] 2019 (Gyo-Ke) 10159 [X-Ray Fluoroscopic Imaging Apparatus] <Kanno>

<Inventive step> A difference between the problem addressed by ‘the invention at issue’ and that addressed by ‘the primary cited invention’ weighs against a finding that the distinguishing feature would have been obvious!!

+The court recognized significance in ‘newly identifying the difficulty as a problem to be addressed.’

=2010 (Gyo-Ke) 10075 [Ventilation Fan Filter] <Iimura>, etc.

(15) [Patents] X-Ray Fluoroscopic Imaging Apparatus — YouTube

English translation of the image

2019 (Gyo-Ke) 10159 [X-ray Fluoroscopic Imaging Apparatus] <Kanno>

Inventive step: A difference between the problem of the claimed invention and that of the primary cited invention weighs against finding the differences readily conceivable. The court also evaluated the significance of newly taking up the issue as a problem. See also 2010 (Gyo-Ke) 10075 [Ventilation Fan Filter] <Iimura>, etc.

[Excerpt from the judgment] ‘The invention … can also sufficiently be evaluated as significant in newly taking up the issue of making image adjustments easier from the operator's perspective as a problem. … On the premise of such a problem … it cannot be said that there is motivation to adopt the configuration constituting the difference ….’

★ 2019 (Gyo-Ke) 10082 [Electric Insulated Cable] <Shoji>: The problem is common, but the cited invention solves it by a different means. ⇒ There is no motivation additionally to combine a secondary

reference. Also 2007 (Gyo-Ke) 10238, 2012 (Gyo-Ke) 10328, 2016 (Gyo-Ke) 10103, and 2017 (Gyo-Ke) 10013.

Left diagram: Claimed invention; Cited Reference 2 — readily conceivable; Cited Reference 1 — difficult to conceive. Where the claimed invention's problem is known, inventive step is likely to be denied even if the difference between the claimed invention and the cited reference is large. Where the claimed invention's problem is novel, inventive step is likely to be affirmed even if the difference is small.

Center diagram: Claimed Invention A — Problem A; Claimed Invention B — Problem B. The claim language is the same, but the inventions' problems differ. Primary reference — Problem A; secondary reference — Problem A. Combination for Invention A: readily conceivable. Combination for Invention B: difficult to conceive.

(1) U.S. practice: Even if the claimed invention's problem differs from that of the primary reference, non-obviousness is denied if the primary and secondary references can be combined to solve a problem different from that of the claimed invention. (2) EPO Examination Guidelines: Under the problem–solution approach, determine the objective technical problem to be solved (Guidelines G-VII, 5.2).

Inset heading: Starting point of inventive step.

Original Ameblo publication: 2023-04-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12796660319.html

Tokyo District Court, 2019 (Wa) 20074 [Heater Assembly for an Aerosol-Generating System] <Kokubu>

<Satisfaction of claim limitations>

Even an inseparably integrated structure falls within ‘coupled to the heater.’

⇒ Whether ‘coupled’ includes integral molding may be outside the decision's reach.

<Damages>

Advertising expenses directly related to sales may be deducted from profits under Article 102(2).

The contribution of design to sales was unclear.

Market shares and the like of competing products must be proved.

(Excerpt from the court's reasoning)

Claim Element C provides that the heater assembly of the invention comprises ‘a heater mount coupled to the heater.’ In ordinary usage, ‘coupling’ means ‘two or more things becoming connected as one; also, connecting them into one’ (Exhibit Otsu 1). It is therefore natural from the wording to understand that a heater mount connected to the heater to form one unit or assembly satisfies this element, whether or not they can be described as inseparably integrated. Such a heater mount would also be expected to achieve the …function and effect of structurally supporting the heater and securely fixing it within the aerosol-generating device. Furthermore, the specification contains no explanation or the like requiring a restrictive interpretation of ‘coupled to the heater.’ Accordingly, a heater mount connected to the heater to form one unit or assembly falls within ‘coupled to the heater,’ irrespective of whether they are inseparably integrated….

[U.S. Patents] December 2022, CAFC, Google v. Hammond <Collateral estoppel>

Original Ameblo publication: 2023-04-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12797973156.html

[U.S. Patents] December 2022, CAFC, Google v. Hammond

Claim 18 of the second patent (the ’816 patent) was materially identical to claim 18 of the first patent (the ’483 patent), which had been finally held unpatentable; the specifications were also the same. The patentability issue was therefore identical, and collateral estoppel barred relitigation, rendering claim 18 unpatentable. Claim 14 was also held unpatentable because the parties agreed that it should receive the same disposition. For claims 15–17 and 19, however, the court affirmed the Board’s determination that unpatentability had not been established.

⇒ Identity of the patentability issue is crucial!!

IP High Court, 2020 (Ne) 10042 [Vehicle Guidance System] <Honda> — *Reversed on appeal: claim limitations held satisfied

Original Ameblo publication: 2023-04-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12798460321.html

2020 (Ne) 10042 [Vehicle Guidance System] <Honda>

Overstated descriptions in the ‘Problem’ and ‘Effects’ sections of the specification

⇒ Both the first-instance court and the appellate court construed the claims in light of the problem/effects, but the appellate court adopted a broader interpretation.

⇒ Finding of non-satisfaction reversed on appeal

‘In relation to the problem addressed by the inventions and their functions and effects, …the relative positions cannot be restricted as the appellee argues.’

‘The claims do not state that the “guidance means for guiding to the second lane” provide automatic guidance, and the specification does not exclude an attendant's involvement in the “guidance means.” … The functions and effects can be achieved.’

(Excerpt from the court's reasoning)

The inventions produce Function and Effect 1 (providing a vehicle guidance system that safely guides vehicles even where an ordinary vehicle enters an entrance/exit for ETC-equipped vehicles, or the ETC system fails to operate normally for an ETC-equipped vehicle). Function and Effect 1 is achieved if data received by the ‘communication means’ from the vehicle's ETC unit are used to determine whether ETC toll collection is possible and the barriers operate at appropriate times so that the vehicle can be guided safely. That function and effect can be achieved whether the ‘communication means’ receive the data from the ETC unit before or after the vehicle passes the first barrier. Turning to Function and Effect 2 (providing a safe vehicle guidance system using an ETC system that prevents wrong-way driving or avoids collisions between preceding and following vehicles), the ‘wrong-way vehicles’ in the inventions include vehicles entering an ETC lane against the permitted direction of traffic through the exit of that lane or the exit of a departure lane, for purposes such as avoiding toll payment. It is clear that preventing such wrong-way driving has no relationship to the relative positions of the ‘communication means’ and ‘first barrier.’ Moreover, regardless of the position of the communication means, lowering the first barrier after the vehicle has passed it prevents wrong-way travel by reversing. …Accordingly, the problem and functions and effects of the inventions do not specify the relative positions of the ‘communication means’ and ‘first barrier’ as the appellee argues….

The claims do not state that the ‘guidance means for guiding to the second lane’ provide automatic guidance, and the specification does not exclude an attendant's involvement in the ‘guidance means.’ In the appellee's systems, although departure-control devices [barriers] (1) and (5) are opened by human operation, there is no need to summon an attendant to the site by intercom. Furthermore, opening those devices allows the vehicle to advance toward the second lane, eliminating the risk that it will try to leave the lane by reversing. The systems can therefore solve the problems addressed by the inventions—‘the need to summon an attendant by intercom exacerbates congestion’ and ‘attempting to leave by reversing creates a danger of collision with following vehicles’—and can achieve the functions and effects of ‘providing a vehicle guidance system that safely guides vehicles’ and ‘providing a safe vehicle guidance system capable of avoiding collisions between preceding and following vehicles.’ The inventions themselves also contemplate that a vehicle may stop before the first barrier…. Accordingly, there is no reason to construe the ‘guidance means for guiding to the second lane’ restrictively as the appellee argues, and that argument cannot be accepted.

IP High Court, 2021 (Gyo-Ke) 10085 [Printed Retroreflective Sheet] <Kanno>

Original Ameblo publication: 2023-04-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12798957874.html

2021 (Gyo-Ke) 10085 [Printed Retroreflective Sheet] <Kanno>

Multiple differences concerning features indispensable to solving the problem should be assessed together as an integrated configuration when determining whether they were readily conceivable.

'…The problem could not be recognized, and there is no motivation to apply the technology described in Exhibit Ko 3 on the premise of such a problem.'

⇒ Inventive step upheld

'…In the invention, …adhesion between the "surface protective layer" and the "support layer" is taken for granted. The defendant's argument therefore rests on an erroneous premise and cannot be accepted.'

⇒ Support requirement satisfied

(Excerpt from the court's reasoning)

<Inventive step>

The invention …has technical significance in (i) …(ii) …(iii) …(iv) …to solve the problems of the prior art, and …(ii) and (iii) can be said to be indispensable features for solving the problem. Accordingly, rather than separately assessing whether Differences 1-1 and 1-4 concerning (ii) and (iii) were readily conceivable, they should be assessed as an integrated configuration. (Even if they were considered separately, the conclusion would not change….)

…The Exhibit Ko 1 invention has a gap between microspheres 16 and cover layer 18, together with a printing layer uniformly patterned in multiple white-colored dots on one or both sides of that cover layer. Cover layer 18 is not attached to the assembly except at portions adjacent to the edges of the sheet. The gap is provided to form an optical path for retroreflection. Accordingly, a person skilled in the art encountering the Exhibit Ko 1 invention cannot recognize the problem of water or the like entering the gap between the printed portion and second layer 14, causing swelling or the like in the printing layer and thereby reducing retroreflectivity; there is no motivation to apply the technology described in Exhibit Ko 3 on the premise of such a problem.

<Support requirement>

…The defendant argues …that the JPO decision questioned not only the failure to specify adhesion between the 'support layer' and 'surface protective layer,' but also the failure to establish that those layers in portions of Invention 1 without an 'independent printing region' are bonded over a width maintaining close adhesion. Because the claimed 'retroreflective sheet' lacking that configuration includes embodiments that would not receive an 'abnormality-free' evaluation in the weather-resistance test described in the specification…, the defendant argues that the support requirement is violated. However, in the invention, … adhesion between the 'surface protective layer' and 'support layer' is taken for granted. The defendant's argument therefore rests on an erroneous premise and cannot be accepted.

[U.S. Patents] USPTO memorandum of August 18, 2020 — Treatment of AAPA in IPR

Original Ameblo publication: 2023-04-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12799264032.html

[U.S. Patents] USPTO memorandum of August 18, 2020

In an IPR, applicant-admitted prior art (AAPA) cannot itself serve as the prior art forming the basis of a ground under 35 U.S.C. §311(b). Under the 2022 updated guidance, however, it may be used as evidence of a skilled artisan’s general knowledge in an obviousness analysis based on prior-art patents or printed publications.

⇒ Take care with admissions of prior art in the specification; they can needlessly give things away, particularly in the United States!!

https://www.patent-topics-explorer.com/entry/2022/02/15/211448

IP High Court, 2017 (Gyo-Ke) 10201 [Beauty Device] <Takabe>

Original Ameblo publication: 2023-04-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12799436317.html

2017 (Gyo-Ke) 10201 [Beauty Device] <Takabe>

*Even though closely interrelated Differences 1 and 2 (the respective numerical ranges) are disclosed in different references, inventive step was upheld.

Cf. ‘Obvious-upon-obvious’

⇒ Describe the relationship between the respective numerical ranges in the specification!!

Cf. 2018 (Gyo-Ke) 10013, decided on the same day by the same division between the same parties, to the same effect

‘The features corresponding to Differences 1 and 2 are not wholly independent but closely interrelated…. The fact that the respective numerical-range features are disclosed in separate references does not establish …that a person skilled in the art could readily have conceived of those features.’

(Excerpt from the court's reasoning)

…At the very least, the features corresponding to Differences 1 and 2 are not wholly independent but closely interrelated. Accordingly, the fact that the respective numerical-range features corresponding to those differences are disclosed in separate references does not establish that a person skilled in the art could readily have conceived of them….

When the beauty device of the corrected invention is in use, the configuration corresponding to Difference 3 can be described as preventing the ball-support shafts from directly contacting the skin. In terms of relating to which part of the balls contacts the skin, the same is true not only of the common feature ‘inclining the axes of the balls forward relative to the handle centerline so that the axes maintain a constant angle relative to the skin during reciprocating movement,’ but also of the feature corresponding to Difference 1, ‘setting the opening angle between the pair of ball-support shafts to 65–80 degrees,’ and the feature corresponding to Difference 2, ‘setting the spacing between the outer peripheral surfaces of the pair of balls to 10–13 mm.’ Accordingly, the feature corresponding to Difference 3 should not be regarded as independent of those other features of the corrected invention, including the features corresponding to Differences 1 and 2; rather, it is appropriate to understand and identify them as mutually related.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-87967.pdf

IP High Court, 2021 (Gyo-Ke) 10140 [Electroformed Tube Case] — *I have posted a commentary on the Nakamura & Partners website

Original Ameblo publication: 2023-04-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12799998131.html

2021 (Gyo-Ke) 10140 [Electroformed Tube Case] <Presiding Judge Kanno>

[Patents ★] Within the cases known to the author when the original article was published, the first and only lower-court decision to require ‘impossible or impractical circumstances’ for the clarity of a product invention defined by its manufacturing process, and to find a violation of the clarity requirement

*I have posted a commentary on the Nakamura & Partners website.

(Excerpt from the court's reasoning)

…Even where claims for a patent on a product invention recite the manufacturing process for that product, if, unlike the general situation described above, it is unambiguously clear at the filing date from the claims, specification, drawings, and common general technical knowledge what structure or properties the product manufactured by that process represents, third parties' interests are not unjustly harmed. It is therefore understood that there is no violation of the clarity requirement even in the absence of impossible or impractical circumstances….

…The specification neither states nor suggests anything concerning the inner-surface accuracy of electroformed tubes manufactured by the processes of Invention 6 and Corrected Invention 9. The specification describes the following methods of removing the fine wire: (i) forming a gap between the electrodeposit, etc. and the fine wire by heating and thermally expanding the electrodeposit, etc. or cooling and shrinking the wire; (ii) making the contact area between the fine wire and the electrodeposit, etc. slippery by immersing it in liquid or pouring liquid over it; (iii) pulling from one or both ends to deform it so as to reduce its cross-sectional area and thereby form a gap between the fine wire and the electrodeposit, etc., then gripping and pulling it, suctioning it, physically pushing it, or forcing it out by ejecting gas or liquid; and (iv) melting or dissolving it with heat or a solvent ([0041], [0116]). However, there is no description whatsoever of the technical relationship between these methods and the inner-surface accuracy of the electroformed tube produced, much less any statement or suggestion that the manufacturing processes of Invention 6 and Corrected Invention 9 (included in method (iii) above) signify a particular inner-surface accuracy different from that of tubes produced by other methods. Nor can it be found that there was common general technical knowledge as to whether these methods produce differences in inner-surface accuracy. Accordingly, the structure or properties of electroformed tubes produced by the manufacturing processes of Invention 6 and Corrected Invention 9 cannot be said to be unambiguously clear….

For the foregoing reasons, Invention 6 and Corrected Invention 9 can be regarded as clear only if, at the filing date of this application, there were impossible or impractical circumstances preventing the electroformed tubes of those inventions from being defined directly by their structure or properties. The defendant acknowledges that no such circumstances existed.

https://www.nakapat.gr.jp/ja/legal_updates_jp/%e3%80%90%e7%89%b9%e8%a8%b1%e2%98%85%e3%80%91%e8%a3%bd%e9%80%a0%e6%96%b9%e6%b3%95%e3%81%ab%e3%82%88%e3%82%8a%e7%89%b9%e5%ae%9a%e3%81%95%e3%82%8c%e3%81%9f%e7%89%a9%e3%81%ae%e7%99%ba%e6%98%8e%e3%81%ae/

[U.S. Patents] June 2022, CAFC, Novartis v. Accord Healthcare

Original Ameblo publication: 2023-04-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12799999104.html

[U.S. Patents] June 2022, CAFC, Novartis v. Accord Healthcare

A negative limitation added during prosecution to avoid prior art does not satisfy the written-description requirement merely because the specification lacks an affirmative disclosure. (The requirement is satisfied if a person skilled in the art can understand the specification as effectively disclosing the negative limitation.)

⇒ In this case, the written-description requirement was not satisfied.

https://www.itohpat.co.jp/ip/1900/

IP High Court, 2022 (Gyo-Ke) 10019 [Die for Wire Having a Polygonal Cross Section] <Honda>

Original Ameblo publication: 2023-04-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12799999248.html

2022 (Gyo-Ke) 10019 [Die for Wire Having a Polygonal Cross Section] <Honda>

The claim wording ‘substantially polygonal’

⇒ Directly related to the problem/effect (making lubricant less likely to accumulate at the corners of the opening).

⇒ Unclear how much rounding of the corners falls within the term.

⇒ Violation of the clarity requirement (JPO decision revoked)

(Excerpt from the court's reasoning)

…(…The tendency of lubricant to accumulate at a corner of the opening is understood to depend not only on the radius of curvature of the rounded corner, but on various factors, including the type of wire, type of lubricant, and degree of heat generated by processing. It cannot be found that a radius of approximately 0.3 mm or less invariably prevents the inventions' effect from being obtained. The defendant's argument therefore cannot be accepted.) …

According to the claims and specification, ‘substantially polygonal’ in the inventions can provisionally be understood as a figure obtained by actively rounding all or some corners of an opening that had not undergone such treatment, in order to achieve the inventions' effect (making lubricant less likely to accumulate at the corners). However, the objective shape does not distinguish ‘substantially polygonal’ from the ‘underlying polygonal cross section.’ Nor is it clear how large a rounding of the corners of the ‘underlying polygonal cross section’ qualifies as ‘substantially polygonal.’ The technical scope of the inventions must therefore be regarded as unclear, and ‘substantially polygonal’ is unclear to the extent of unjustly harming third parties' interests….

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91532.pdf

IP High Court, 2022 (Gyo-Ke) 10027 [Tilling Claw] <Shoji> — *‘Substantially constant’ and ‘substantially the same’ ⇛ Clarity requirement satisfied

Original Ameblo publication: 2023-04-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12799999446.html

2022 (Gyo-Ke) 10027 [Tilling Claw] <Shoji>

‘Substantially constant distance’ = ‘predetermined distance’ in the detailed description

⇒ Clarity requirement satisfied

‘Substantially the same position’ — The position need only be sufficient to achieve the invention's effect (suppressing uneven wear), and a person skilled in the art can understand that degree.

⇒ Clarity requirement satisfied

(Excerpt from the court's reasoning)

[Claim 1] …A tilling claw …in which the end of the hard-alloy portion on the mounting-base side is positioned at substantially the same position as the sharpened end of the longitudinal blade portion, …and the ridge-side end of the hard-alloy portion …extends along the ridges of the longitudinal and transverse blade portions, at a substantially constant distance toward the cutting-edge side from those ridges….

…Both ‘substantially constant distance’ in Feature 1E of Invention 1 and ‘predetermined distance’ in paragraphs [0032] and [0042] of the specification, etc. refer to the distance between the ridge-side end of the hard-alloy portion and the ridges of the longitudinal and transverse blade portions. It is therefore natural to construe the latter ‘predetermined distance’ as having the same meaning as the former ‘substantially constant distance.’ Such an interpretation allows Invention 1 and its embodiments to be understood as achieving the functions and effects stated in the specification, etc.

…The [Effects of the Invention] section of the specification, etc. states: ‘According to the invention, … uneven wear in which the longitudinal blade portion wears significantly more than the transverse blade portion can be suppressed’ (paragraph [0009]). Whether the respective ends are in ‘substantially the same position’ therefore depends on whether their positions allow the hard-alloy portion to cover the sharpened part of the longitudinal blade sufficiently to ‘suppress uneven wear in which the longitudinal blade portion wears significantly more than the transverse blade portion,’ including portions without hard alloy. A person skilled in the art can understand that degree in light of the specification, etc.

IP High Court, 2021 (Gyo-Ke) 10135 [Vector Containing a Stuffer/Filler Polynucleotide Sequence] <Kanno>

Original Ameblo publication: 2023-04-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12800692051.html

2021 (Gyo-Ke) 10135 [Vector Containing a Stuffer/Filler Polynucleotide Sequence] <Kanno>

Numerical limitation with insufficient working-example data

⇒ Identical technical significance

⇒ The numerical limitation was held not to be a substantive difference!!

⇒ Novelty denied !!!!!!!!!!!!!

[Claim 1] …The polynucleotide sequence has a length of 7.0 to 10.0 Kb…

'There is no technical significance in the length falling within the specific range "7.0 to 10.0 Kb," …and it cannot be regarded as a substantive difference.'

(Excerpt from the court's reasoning)

[Claim 1] …A recombinant vector plasmid in which the first inactive filler or stuffer polynucleotide sequence has a length of 7.0 to 10.0 Kb.

There is no technical significance in the filler or stuffer polynucleotide sequence of the vector plasmid having a length within the specific range '7.0 to 10.0 Kb.' …In the cited invention too, the stuffer sequence is modified so that the backbone exceeds AAV's packaging capacity. The combined length of the transgene (4,297 nt (approximately 4.297 Kb)) and the stuffer sequence contained in this backbone (6,980 bp (approximately 6.980 Kb)) can be understood to exceed the packaging capacity of 4.7 Kb. The claimed invention …and the cited invention are therefore identical in technical significance, and specifying the filler or stuffer polynucleotide sequence of the vector plasmid in the claimed invention …to have a length within the specific range '7.0 to 10.0 Kb' is not a substantive difference. …It cannot readily be found that the amount of residual DNA in the AAV particles of the claimed invention …is even lower than 2.69 ± 0.69 pg/10^9 vg; nor, even if the residual DNA amount decreases, can it readily be found that the decrease results from lengthening the oversized backbone….

[U.S. Patents] February 2016, CAFC, PPC Broadband v. Corning

Original Ameblo publication: 2023-05-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12801142292.html

[U.S. Patents] February 2016, CAFC, PPC Broadband v. Corning

‘Reside around’ was construed narrowly under the BRI standard by reference to the specification.

‘Around’ appears seven times in the specification.

⇒ In each instance, it means ‘encircling or surrounding.’

‘Near’ and ‘nearest’ appear twelve times in the specification.

⇒ In each instance, they mean ‘in the vicinity of.’

The two are not used interchangeably.

http://beikokupat.com/us-patent/number15/

[U.S. Patents] March 2018, CAFC, In re Power Integrations

Original Ameblo publication: 2023-05-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12801307033.html

[U.S. Patents] March 2018, CAFC, In re Power Integrations

*The claim term ‘coupled’ was construed narrowly under the BRI standard by reference to the specification.

The BRI standard interprets claims broadly, but does not confer unlimited authority to construe claim language while disregarding the claim as a whole or the specification.

[U.S. Patents] August 2022, CAFC, In re McDonald

An invention intentionally surrendered by the patentee during prosecution cannot be recovered through reissue under the rule prohibiting recapture.

⇒ After adding ‘processor’ in response to a Section 101 rejection, the patentee could not delete it in reissue.

https://openlegalcommunity.com/reissue-cannot-get-back-what-is-gave-away/

[Copyright] A Case Finding Inclusion of Tweets in a Book to Be Lawful Quotation under Copyright Act Article 32(1): the KuToo Case

Original Ameblo publication: 2023-05-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12801580604.html

[Article] A Case Finding Inclusion of Tweets in a Book to Be Lawful Quotation under Copyright Act Article 32(1): the KuToo Case (Takuto Hirasawa)

Among the judgments surveyed in this article that rejected lawful quotation, the grounds were as follows:

Many reject the ‘within a justified scope’ requirement!

Only ‘fair practice’ rejected: two decisions (the first-instance judgment and appeal in the same case)

‘Principal–subordinate relationship’ rejected: two cases

Only ‘made public’ rejected: three cases

‘Purpose of the quotation’ rejected: one case

[Copyright] Cases Rebutting the Presumption under Article 61(2), (1): Osaka High Court decision, March 31, 2011, ‘Hikonyan’

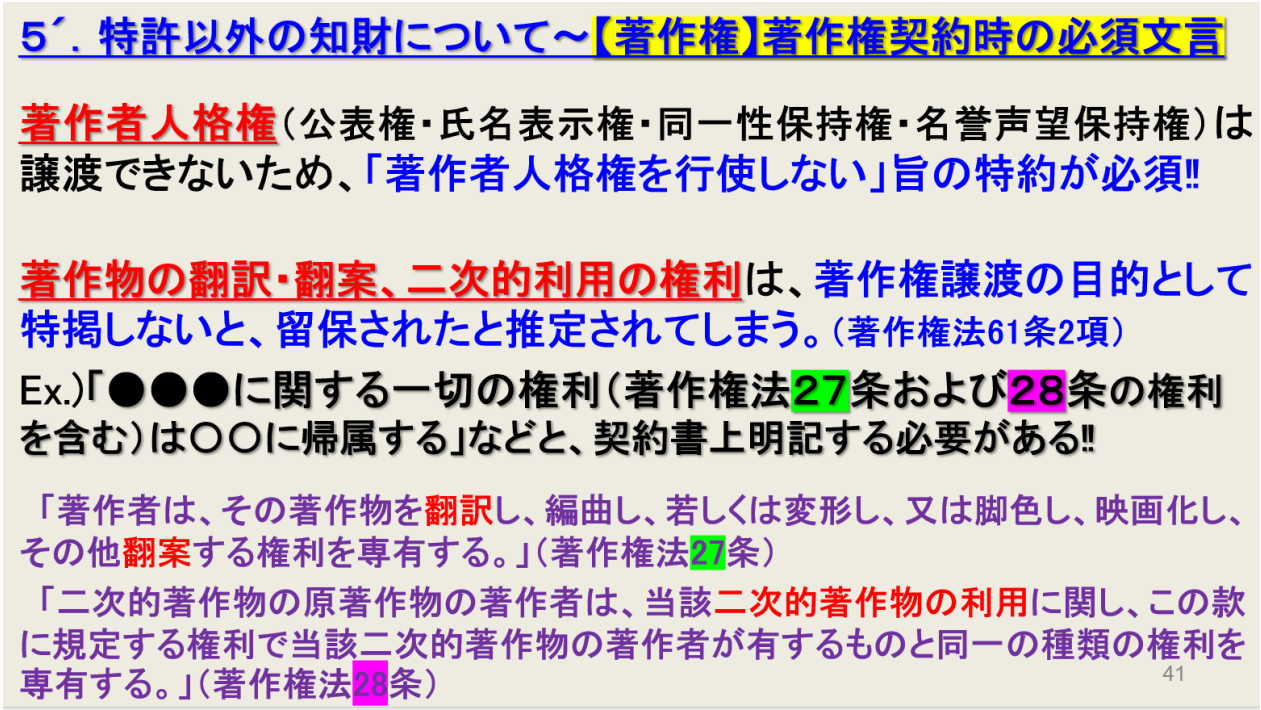
The character was adopted with the expectation of broad use as the mascot for the 400th anniversary festival of Hikone Castle's construction.



The contract states that three-dimensional objects may be freely created and used.

⇒ Three-dimensional objects may be created from the respective illustrations.

[Copyright] Cases Rebutting the Presumption under Article 61(2), (2): IP High Court judgment, August 31, 2006, ‘System K2’

The master agreement provided that the effect of copyright assignments under individual agreements would survive termination of those agreements, vested copyright in the program in the defendant, and allowed the defendant to use it. The development fee was substantial. The plaintiff received a share of the defendant's sales profits.

English translation of the image

5. Intellectual property other than patents — [Copyright] Essential wording in copyright contracts

The author's moral rights (the right to make a work public, the right of attribution, the right to integrity, and protection of honor and reputation) cannot be transferred; therefore, a special agreement that the author will not exercise moral rights is essential!!

The rights to translate or adapt a work and to exploit derivative works are presumed to be reserved unless specifically identified as the subject of the copyright transfer (Copyright Act, Article 61(2)).

For example, the contract needs to expressly state: ‘All rights relating to ●●● (including the rights under Articles 27 and 28 of the Copyright Act) belong to ○○’!!

‘The author has the exclusive right to translate, arrange musically or transform, or dramatize, cinematize, or otherwise adapt the work.’ (Copyright Act, Article 27.)

‘The author of the original work of a derivative work has, with respect to exploitation of that derivative work, rights of the same kinds as those held by the author of the derivative work under this Subsection.’ (Copyright Act, Article 28.)

[Portrait Rights] Tokyo District Court, 2020 (Wa) 33192 <Nakashima>

Original Ameblo publication: 2023-05-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12802296907.html

[Portrait Rights] 2020 (Wa) 33192 <Nakashima>

Infringement of personal interests through the photographing or publication of a person's image may arise where the person suffers mental distress beyond the limits tolerable under prevailing social norms, such as when (i) information from the private sphere is photographed or published and is not a matter of public interest; or (ii) even in the public sphere, information that is insulting beyond those limits is photographed or published, or its publication risks disrupting peaceful daily life beyond those limits.

The fact that the photograph 'supplements the article stating that the plaintiff committed an act attracting strong public condemnation, and therefore concerns a matter of public interest' was also given as a reason for finding no infringement of portrait rights!!

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91350.pdf

IP High Court, 2021 (Gyo-Ke) 10056 [Information Processing Apparatus] <Shoji> — Invention-defining features in subcombination claims

Original Ameblo publication: 2023-05-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12802443112.html

2021 (Gyo-Ke) 10056 [Information Processing Apparatus] <Shoji>

In this case, the recitations concerning the counterpart of the subcombination were held not to limit the configuration or function of the claimed information-processing apparatus.

⇒ Not an invention-defining feature. (The court upheld the dismissal of the amendment for lack of inventive step in the amended invention and the JPO decision based on lack of novelty in the unamended invention.)

<Question> If the counterpart of a subcombination is ABCD and therefore requires D′ as an interface, are ABC also invention-defining features?

⇒ If so…, while inventive-step analysis considers whether ‘the counterpart of the subcombination is ABCD’ was readily conceivable, is the mere presence of ‘D′ as an interface’ enough for satisfaction of the claim?

Or should satisfaction of the claim be considered as with a use invention?

Or should novelty and inventive step be considered as with a PBP claim?

Cf. ‘Roll Paper for Packaging Medicine in Separate Doses’ judgment (IP High Court, 2019 (Ne) No. 10009, June 27, 2019 (Presiding Judge Otaka))

[U.S. Trademarks / Patents and Designs] In re Reelex Packaging Solutions (CAFC, November 5, 2020)

Original Ameblo publication: 2023-05-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12802584733.html

[U.S. Trademarks / Patents and Designs] In re Reelex Packaging Solutions (CAFC, November 5, 2020)

(i) The disclosures and drawings of utility patents demonstrated the design’s functionality.

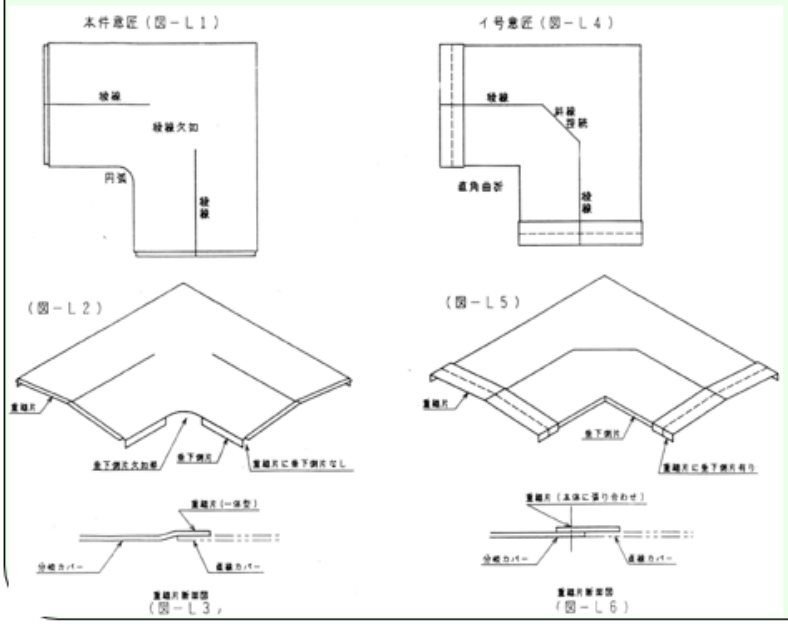
(ii) The applicant's advertising promoted the design's utility.

(iii) Where other evidence establishes functionality, the mere availability of alternative designs does not justify registration. The evidence offered of alternative designs was also found insufficient.

⇒ Trade-dress application refused

*In Japan, the Tokyo District Court in the ‘Rack Cover’ case, 1999 (Wa) 13242, excluded shapes dictated by the product’s function and similar features from the essential design features, found the remaining essential features dissimilar, and dismissed the claims. It did not invalidate the design registrations on the ground of functionality.

https://openlegalcommunity.com/trade-dress-and-patents/



2－2．意匠の類似（侵害論）

機能的に必然な構造は、「要部」でない⇒非類似

東京地判平成11年（ワ）13242「ラック用カバー」事件

「L字状及びT字状の形状は，冷媒管等のラックカバーという物品の機能を果たすためには必然的なものであるから，この形状が本件登録意匠の特徴的部分ということはできず，これを要部ということはできない。・・・90度に交わる2つの突出部がそれぞれ山型屋根状をしているが，この頂部稜線が接することなく途切れている。そして，この稜線が途切れた部分は平らになっている。この部分は・・・ほとんどが機能必然的な構成からなる本件登録意匠1において，看者の注意を引きやすい部分である」

⇒非類似(非侵害)

81

English translation of the image

2-2. Similarity of designs — infringement

A functionally inevitable structure is not an essential part ⇒ No similarity.

Tokyo District Court, 1999 (Wa) 13242 [Duct Cover]

‘The L-shaped and T-shaped forms are inevitable for fulfilling the function of an article that is a duct cover for refrigerant pipes and the like. Accordingly, those forms cannot be regarded as characteristic portions of the registered design, and cannot be called essential parts. … The two projections intersecting at 90 degrees each have the shape of a gabled roof, but their top ridge lines are interrupted without meeting. The portion where these ridge lines are interrupted is flat. That portion … is likely to attract the viewer's attention in

Registered Design 1, which consists mostly of functionally inevitable structures.’ ⇒ No similarity (no infringement).

Diagram labels include: registered design at issue (Figure L1); Defendant’s Design No. 1 (Figure L4); ridge line; absence of a ridge line; circular arc; right-angle bend; overlapping tab; downward flap; portion without a downward flap. Figures L2 and L5 are perspective views, and Figures L3 and L6 are cross-sectional views of the overlapping tabs.

[U.S. Patents] Almirall v. Amneal (CAFC), March 14, 2022

Original Ameblo publication: 2023-05-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12802794331.html

[U.S. Patents] Almirall v. Amneal (CAFC), March 14, 2022

Claim: '…does not contain adapalene'

The composition disclosed in the primary reference did not contain adapalene, although the reference did not affirmatively state that adapalene was absent.

Patentee's argument — The primary reference does not state 'does not contain adapalene.'

This judgment — Disclosure of a negative limitation does not require a statement that a feature is absent.

⇒ This limitation was held to be disclosed in the prior art; together with the other findings, this supported the conclusion that the claims were obvious.

https://openlegalcommunity.com/overlapping-ranges-and-negative-limitation-obviousness/

[New YouTube Video] Overview of the Issues to Know Now Ahead of the May 26 Dwango Grand Panel Judgment

Original Ameblo publication: 2023-05-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12803337200.html

[New YouTube Video] Overview of the Issues to Know Now Ahead of the May 26 Dwango Grand Panel Judgment

(Partly) foreign working and infringement of patents and other rights (overseas ⇒ domestic)

Cases involving tangible goods (+ trademarks)

Foreign judgments involving working partly abroad

<Contents>

1. Relationship between the two patents

2. First litigation (patent for a program + display apparatus)

(1) Reversed on appeal: claim limitations held satisfied — Is satisfaction in a particular situation enough?

(2) Territoriality — Distribution of a program to domestic users

(3) Normative attribution of infringement (the copyright ‘karaoke doctrine’)

3. Second litigation (system patent) — Multiple actors

4. Divisional-application strategies (general)

[Article] Antitrust Assessment of Product Hopping by Pharmaceutical Companies (Naoko Mariyama, September 2017)

Original Ameblo publication: 2023-05-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12803617069.html

[Article] Antitrust Assessment of Product Hopping by Pharmaceutical Companies (Naoko Mariyama, September 2017)

In the United States, there is an argument that a hard switch of an originator pharmaceutical product (for example, discontinuing the old product when changing dosage form) impedes competition because generic manufacturers must submit an ANDA each time.

⇒ ‘Rule of reason’

https://www.inpit.go.jp/content/100862918.pdf

[Personality Rights] Tokyo District Court, 2021 (Wa) 30051 — ‘It cannot be said that peaceful daily life was disrupted’

Original Ameblo publication: 2023-05-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12804040440.html

[Personality Rights] 2021 (Wa) 30051

It was inappropriate for the defendant (NHK) to create narration and the like by relying on text on the plaintiff's (an individual's) website, but it published an apology four days after the broadcast.

⇒ No infringement, because the plaintiff's peaceful everyday life cannot be said to have been disturbed to an extent warranting a damages claim.

⇒ Claim dismissed

★The fact that an apology was published four days after the broadcast was taken into account as a factor weighing against a finding of infringement of personality rights.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91458.pdf

Tokyo District Court, 2020 (Wa) 28889 [Method for Treating an Asbestos-Containing Wall]

Original Ameblo publication: 2023-05-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12804040843.html

Tokyo District Court, 2020 (Wa) 28889 [Method for Treating an Asbestos-Containing Wall]

In light of the detailed description, the claim term ‘close proximity’ generally means that the housing and asbestos-containing wall are closely adjacent to an extent placing them in a positional relationship or condition that prevents scattering of the contents and permits their reliable collection.

⇒ Claim limitation not satisfied

Trial and Appeal Practitioner Study Group Report 2022 <Topic 1> — Takaishi's group

IP High Court, 2022 (Ne) 10046, ‘Dwango Grand Panel Judgment’ — Patentee (Dwango) wins on reversal!!

Original Ameblo publication: 2023-05-26

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12804751492.html

2022 (Ne) 10046, ‘Dwango Grand Panel Judgment’ — ★Patentee (Dwango) wins on reversal!!

⇒ Although the server is abroad, the conduct constitutes ‘production’ of the system within Japan.

The substantive value judgment—‘If merely locating the server abroad allowed a patent to be readily avoided, sufficient protection could not be afforded to the patent for the system invention, which would be inappropriate’—is the same as in the IP High Court judgment in the earlier case.

★Similar judgments have been issued in comparable cases abroad. My impression is that, worldwide, foreign-server issues are being treated as infringement by focusing on the place where the result (economic benefit) occurs.

⇒ Please see my YouTube video prepared before the Grand Panel judgment (below) and the presentation materials (in the video's description).

https://www.youtube.com/watch?v=nxFYw1cqaQI

(Excerpt from the summary) Even where a server is abroad, if, after comprehensive consideration of the specific manner of the act; the functions and roles in the invention of the system elements located domestically; the place where the effects of the invention are obtained through use of the system; the impact of that use on the patentee's economic interests; and other circumstances, the act can be regarded as having been performed within Japan's territory, it constitutes ‘production’ under Article 2(3)(i) of the Patent Act….

IP High Court, 2022 (Ne) 10093 [Use of Eribulin in Treating Breast Cancer] <Otaka>

Original Ameblo publication: 2023-06-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12805776749.html

2022 (Ne) 10093 [Use of Eribulin in Treating Breast Cancer] <Otaka>

*Appeal dismissed

The assertion that the patents prevented marketing authorization by the Minister of Health, Labour and Welfare was the plaintiff's argument. The court relied, among other circumstances, on the lack of sufficient evidence of a high likelihood of authorization and drug-price listing in the near future, and consequently of manufacture and sale.

⇒ No interest in obtaining declaratory relief

(i) An action seeking a declaration of illegality of inaction on an approval application is possible!!

(ii) Administrative appeals and the like to the Minister of Health, Labour and Welfare are possible!!

‘Suspension of Examination of Divisional Applications’

Original Ameblo publication: 2023-06-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12805787815.html

‘Suspension of Examination of Divisional Applications’

Divisional applications for which examination was requested on or after April 1, 2023, and examination has not yet begun, may qualify for suspension if all requirements (1)–(3) below are met.

(1) The divisional application was divided after a decision refusing the original application.

(2) An appeal against the refusal of the original application has been filed, and that application is pending either in reconsideration by the examiner following the filing of the appeal or in the appeal proceedings.

(3) It is expedient to await the outcome of that reconsideration or the appeal concerning the original application.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12806199947.html

2019 (Ne) 10007 [Apparatus Displaying a … Ladder Circuit] <Kanno>

For an invention combining existing components, each existing component was held to be an indispensable article!!

⇒ Indirect infringement under Article 101(ii) established

⇒ At most approximately one quarter of the users of Defendant Product 1-2 could use the circuit-monitoring functions. The court held that this did not preclude an inference that a non-exceptional proportion of users was highly likely to produce directly infringing products.

⇒ The first-instance court ordered an injunction against the products at issue. On appeal, however, the patentee withdrew the injunction and related claims following expiry of the patent, and the corresponding portions of the first-instance judgment ceased to have effect.

The portion not used to produce directly infringing products is deducted from the relevant quantity as a circumstance preventing sales under Article 102(1)(i) of the Patent Act and constitutes a ground for rebutting the damages presumption under Article 102(2).

Tokyo District Court, 2020 (Wa) 29897 <Kokubu> — ‘Claim for Remuneration for an Employee Invention’

Original Ameblo publication: 2023-06-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12806558613.html

Tokyo District Court, 2020 (Wa) 29897 <Kokubu> — ‘Claim for Remuneration for an Employee Invention’

The ‘claim for a registration reward’ and ‘claim for reasonable remuneration’ were conceived as separate claims.

The invention rules and related provisions in this case did not specify when reasonable remuneration was payable or restrict the exercise of the right to claim it.

⇒ In this case, the limitation period for each claim began when the right to obtain the patent was transferred to the employer.

⇒ Under the former law applicable to this case, the limitation period was ten years for the statutory claim for reasonable remuneration and five years for the registration-reward claim under the invention rules (former Article 522 of the Commercial Code).

IP High Court, 2022 (Gyo-Ke) 10030 [Laminate of a Polyester Resin Composition] <Kanno>

Original Ameblo publication: 2023-06-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12806654365.html

2022 (Gyo-Ke) 10030 [Laminate of a Polyester Resin Composition] <Kanno>

*The correction introducing a disclaimer in this case was held not to introduce new technical matter in relation to the technical matters derivable from the specification and related documents, and the exclusion did not affect the invention's technical problem.

⇒ Correction requirements satisfied (inventive step after correction not decided)

★On remand in the opposition proceedings, a preliminary view denying inventive step even with the disclaimer claim was expressed, and a notice of reasons for revocation (advance notice of decision) was issued on May 19, 2023.

(Excerpt from the court's reasoning)

…The defendant argues that a correction to a 'disclaimer claim,' as in Correction 2, could mislead third parties concerning the disclosure in the specification, etc., and is highly likely to cause unforeseen disadvantage. However, even if such concerns existed, they should be considered in examining whether the corrected claims comply with the clarity, support, or other requirements. In any event, it is therefore inappropriate in this case to treat this point, by itself, as a reason to disallow the correction….

…Excluding, by the correction…, 'a laminate having a vapor-deposited inorganic-oxide film thereon and a gas-barrier coating film on that vapor-deposited film' does not introduce new technical matter or add new matter. The problem addressed by the invention is to provide a laminate with a layer made of a resin composition containing carbon-neutral polyester using biomass ethylene glycol: a laminate of polyester resin film comparable in physical properties, such as mechanical characteristics, to conventional laminates made from fossil-fuel-derived raw materials ([0008]). The exclusion has no effect on that technical problem.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12807097839.html

2016 (Gyo-Ke) 10152 [Charge Control Agent] <Mori>

*Problem addressed by the invention

⇒ ‘Means water with the lowest electrical conductivity possible so that conductivity attributable solely to the amount of inorganic salt at the surface of the charge control agent can be measured.’

⇒ ‘Ion-exchanged water’ satisfies clarity.

[Claim 1] …A charge control agent …having an electrical conductivity of 110 μS/cm or less when the metal complex salt compound is dispersed at 1 wt% in ion-exchanged water….

(Excerpt from the court's reasoning)

The invention focuses on the relationship between the quantity of inorganic salt on the surface of the charge control agent and image stability. It measures that surface inorganic-salt quantity by measuring the electrical conductivity when the metal complex salt compound is dispersed at 1 wt% in ion-exchanged water, and provides a charge control agent offering excellent image stability by controlling that conductivity within a specified range. It is therefore clear to a person skilled in the art that ‘ion-exchanged water’ in the invention means water with the lowest electrical conductivity possible, so that, as far as possible, only the conductivity attributable to the amount of inorganic salt at the surface of the charge control agent is measured….

…Because the conductivity difference between measurement samples 1 and 2, prepared under different dispersion conditions, is only 1 μS/cm, these experimental results can be said to indicate that differing dispersion methods cannot produce a substantial difference in the measured electrical conductivity.

IP High Court, 2021 (Gyo-Ke) 10093, ‘Antigen-Binding Proteins against PCSK9,’ Second Judgment (Regeneron) <Kanno>

Original Ameblo publication: 2023-06-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12807460253.html

2021 (Gyo-Ke) 10093, ‘Antigen-Binding Proteins against PCSK9,’ Second Judgment (Regeneron v. Amgen) <Kanno>

=2021 (Gyo-Ke) 10094

Unlike the first judgment (the final judgment in the earlier action), the court rejected, for a functionally expressed reach-through claim, the approach that reciting the effect in the claim satisfies the support requirement.

First judgment: 2017 (Gyo-Ke) 10225 (Sanofi)

[Claim 1] An isolated monoclonal antibody capable of neutralizing the binding of PCSK9 to LDLR protein and competing, for binding to PCSK9, with an antibody comprising a heavy chain including a heavy-chain variable region consisting of the amino-acid sequence of SEQ ID NO: 49 and a light chain including a light-chain variable region consisting of the amino-acid sequence of SEQ ID NO: 23.

(Excerpt from the court's reasoning)

…The problem addressed by the invention is, in the first place, …to provide an antibody that neutralizes the binding between LDLR protein and PCSK9—which, by binding to LDLR protein, decreases the amount of LDLR protein and increases the amount of LDL in a subject—or a pharmaceutical composition containing that antibody. In relation to solving that problem, no independent significance can be found in competition with the reference antibody itself. From this perspective too, …the technical significance of the invention must be said to lie in identifying that an antibody competing with the 21B12 antibody possesses the functional characteristics of a binding-neutralizing antibody through the same mechanism as the 21B12 antibody….

The defendant argues …that even if antibodies existed that compete with the 21B12 antibody (the reference antibody) but cannot neutralize binding between PCSK9 and LDLR protein, such antibodies are excluded by the claim wording from the technical scope of Invention 1, and therefore do not provide a reason for finding a violation of the support requirement. However, as already explained, the technical significance of the invention must be said to lie in identifying that an antibody competing with the 21B12 antibody has the functional characteristics of an antibody neutralizing binding between PCSK9 and LDLR protein through the same mechanism as the 21B12 antibody. If antibodies competing with 21B12 include antibodies without binding-neutralizing ability, the premise of that technical significance plainly collapses. (In a case such as this, if it were sufficient merely to exclude antibodies lacking binding-neutralizing ability by claim wording, extremely broad definitions of the antibody's binding site on PCSK9—for example, most of PCSK9—would also be permitted. That would allow claims to be broadened without legitimate grounds and is therefore inappropriate.) …

In the separate action to revoke the JPO decision concerning the invention, …Sanofi's arguments regarding violation of the support requirement were rejected. However, this can also be understood as resulting from the assumption, taken for granted in light of the allegations and evidence then presented, that antibodies competing with the 21B12 antibody bind to substantially the same location on PCSK9 and have the same function as that antibody. In contrast, in this action, new arguments based on new evidence—including structural analyses in the respective statements of Dr. [A] and Dr. [B] and the expert report of Professor [F] …, and relevant documentary evidence concerning 'EGFa-mimic antibodies'…—have cast doubt on that premise, yet no material supporting it can be found. There is therefore a commensurate reason for the conclusion of the separate judgment and the determination in this case to differ.

https://www.nakapat.gr.jp/ja/legal_updates_jp/%e3%80%90%e7%89%b9%e8%a8%b1%e2%98%85%e2%98%85%e3%80%91%e6%a9%9f%e8%83%bd%e7%9a%84%e3%81%ab%e8%a1%a8%e7%8f%be%e3%81%95%e3%82%8c%e3%81%9f%e3%83%aa%e3%83%bc%e3%83%81%e3%82%b9%e3%83%ab%e3%83%bc%e3%82%af/

IP High Court, 2021 (Gyo-Ke) No. 10140 [Electroformed Tube Case] <Kanno> — PBP claim fails the clarity requirement

Original Ameblo publication: 2023-06-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12807610190.html

2021 (Gyo-Ke) No. 10140 [Electroformed Tube Case] <Kanno>
Within the cases known to the author when the original article was published, the first and only lower-court decision to require ‘impossible or impractical circumstances’ for the clarity of a product invention defined by its manufacturing process, and to find a violation of the clarity requirement. (The legal standard is the same as in other IP High Court judgments.)
⇒ PBP Claims 6 and 9 fail the clarity requirement.
*Violation of the clarity requirement for a PBP claim
⇒ If, at the filing date, the structure or properties of the resulting product are unambiguously clear from the claims, specification, drawings, and common general technical knowledge, the clarity requirement is not violated even without impossible or impractical circumstances.
⇒ This invention is not unambiguously clear.
⇒ Impossible/impractical circumstances were denied.
*How is this consistent with the earlier cases finding that claims were not PBP claims within the meaning of the Supreme Court judgment?
(Excerpt from the court's reasoning)
…Even where claims for a patent on a product invention recite the manufacturing process for that product, if, unlike the general situation described above, it is unambiguously clear at the filing date from the claims, specification, drawings, and common general technical knowledge what structure or properties the product manufactured by that process represents, third parties' interests are not unjustly harmed. It is therefore understood that there is no violation of the clarity requirement even in the absence of impossible or impractical circumstances….
…The specification neither states nor suggests anything concerning the inner-surface accuracy of electroformed tubes manufactured by the processes of Invention 6 and Corrected Invention 9. The specification describes the following methods of removing the fine wire: (i) forming a gap between the electrodeposit, etc. and the fine wire by heating and thermally expanding the electrodeposit, etc. or cooling and shrinking the wire; (ii) making the contact area between the fine wire and the electrodeposit, etc. slippery by immersing it in liquid or pouring liquid over it; (iii) pulling from one or both ends to deform it so as to reduce its cross-sectional area and thereby form a gap between the fine wire and the electrodeposit, etc., then gripping and pulling it, suctioning it, physically pushing it, or forcing it out by ejecting gas or liquid; and (iv) melting or dissolving it with heat or a solvent ([0041], [0116]). However, there is no description whatsoever of the technical relationship between these methods and the inner-surface accuracy of the electroformed tube produced, much less any statement or suggestion that the manufacturing processes of Invention 6 and Corrected Invention 9 (included in method (iii) above) signify a particular inner-surface accuracy different from that of tubes produced by other methods. Nor can it be found that there was common general technical knowledge as to whether these methods produce differences in inner-surface accuracy. Accordingly, the structure or properties of electroformed tubes produced by the manufacturing processes of Invention 6 and Corrected Invention 9 cannot be said to be unambiguously clear….
For the foregoing reasons, Invention 6 and Corrected Invention 9 can be regarded as clear only if, at the filing date of this application, there were impossible or impractical circumstances preventing the electroformed tubes of those inventions from being defined directly by their structure or properties. The defendant acknowledges that no such circumstances existed.

IP High Court, 2021 (Gyo-Ke) 10096 [Light Source] <Honda>

Original Ameblo publication: 2023-06-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12807819959.html

2021 (Gyo-Ke) 10096 [Light Source] <Honda>

A case permitting a coherent technical concept to be extracted from several paragraphs of a cited reference, and denying inventive step by treating a numerical limitation unsupported by data as a design matter.

‘The application specification contains …no experimental results whatsoever for contents exceeding 10 wt %…. There is no particular criticality.’

(Excerpt from the court's reasoning)

…Paragraphs [0012], [0013], and [0015] of the cited reference disclose that the FWHM (full width at half maximum) of the respective emission peaks of the green-emitting and red-emitting semiconductor nanocrystals is, or may be, approximately 45 nm or less. In the surrounding context of the reference, these disclosures are understood to apply generally to the inventions disclosed therein. …There is no statement or suggestion that adopting the feature ‘the FWHM (full width at half maximum) of the emission peaks of the green-emitting and red-emitting semiconductor nanocrystals is approximately 45 nm or less’ …would preclude adopting the feature …in the cited invention. Accordingly, …it is entirely possible for both features to coexist in a single invention based on one coherent technical concept. The JPO decision therefore did not err in identifying the cited invention as including the former feature.

…That cost reduction is a technical problem common to many technical fields can be recognized as self-evident even without an express statement or suggestion in publications such as the cited reference….

…(Difference) For the ‘light conversion layer,’ the amended invention at issue ‘contains a scattering agent,’ with ‘the scattering agent present at 10 wt% or less relative to the total weight of the light conversion layer,’ whereas the presence or absence of a ‘scattering agent’ in the cited invention is unclear….

…The feature ‘the scattering agent is present at 10 wt% or less relative to the total weight of the light conversion layer’

…The application specification merely states, for example, ‘may be contained at 10 wt% or less’…; ‘preferably contained at 10 wt% or less, and more preferably at 1 wt% or more and 5 wt% or less’…; and ‘preferably 10 wt% or less’…. Moreover, …the maximum content stated in the working examples is only 6 wt%…, and the specification contains no experimental results whatsoever for contents exceeding 10 wt% …. It must therefore be said that setting the scattering-agent content to 10 wt% or less of the total weight of the light conversion layer has no particular criticality. In addition, …adjusting the proportions of scattering agent, red quantum-dot material, and green quantum-dot material in the light conversion layer permits adjustment of the color coordinates of white light. Paragraph [0137] of the specification also establishes that adjusting the scattering-agent content permits adjustment of the luminance and the like of white light. Taking into account as well the statement in paragraph [0116] of Well-Known Reference 1 that ‘in a preferred embodiment, the concentration range of scatterers is 0.1 to 10 wt%,’ the proportion of scattering agent relative to the total weight of the light conversion layer could have been designed as appropriate by a person skilled in the art according to the desired white light produced by that layer.

2021 (Gyo-Ke) 10144 [Dot Pattern] <Kanno>

*Language was added to the claims, but this did not constitute narrowing.

⇒ Correction requirements not satisfied

=2021 (Gyo-Ke) 10146 <Kanno>

Before correction — Information represented using any eight directions at 45° intervals as available dot-placement directions

After correction — Four vertical/horizontal directions used for dot placement…

(Excerpt from the court's reasoning)

The configuration before correction represents information using any eight directions at 45° intervals as available dot-placement directions, while the configuration after correction represents information using the four vertical/horizontal directions. The types of information dots defining the information and the manner of representing data therefore differ. In short, the two are different configurations and do not stand in a relationship of inclusion or broader and narrower concepts. Accordingly, Correction 1 cannot be said to have the purpose of ‘narrowing the claims’ under item (i) of the proviso to Article 134-2(1) of the Patent Act.

[Copyright / Provider Liability] IP High Court, 2022 (Ne) 10019 — Claim for disclosure of sender information

Original Ameblo publication: 2023-06-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12808385994.html

[Copyright / Provider Liability] 2022 (Ne) 10019 — Claim for disclosure of sender information

⇒ The person requesting disclosure of sender information must plead and prove both infringement of the right and the absence of circumstances suggesting grounds that would preclude unlawfulness.

⇒ Lawful quotation

In this case, considering that the timeline display varied with the specifications of Twitter and similar services and that clicking an image displayed it in full, the court held that displaying only part of the image was a modification deemed unavoidable under Article 20(2)(iv) of the Copyright Act.

Cf. The Supreme Court decision concerned the right of attribution.

[Unfair Competition Prevention Act, Article 2(1)(iii)] Tokyo District Court, 2021 (Wa) 3418 <Kokubu> — ‘Date first sold’

Original Ameblo publication: 2023-06-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12808612896.html

[Unfair Competition Prevention Act, Article 2(1)(iii)] 2021 (Wa) 3418 <Kokubu>

‘Date first sold’

Even assuming that the plaintiff had developed and marketed the first-generation products at its own expense and effort, the court considered it reasonable to regard almost all of that investment as having been devoted to developing the shape of the shade.

⇒ The later replacement of light bulbs with fluorescent lamps or LEDs, and the addition of remote controls, were not found to have required particular expense or effort.

⇒ The first generation already possessed the product configuration for which protection was sought.

Cf. 2018 (Ne) 10038, ‘Saxophone Strap’

[Article / Designs] ‘Considerations on Assessing Creative Difficulty’ (Patent Attorney Masato Sasaki) (Patent, 2021, Vol. 74, No. 3)

Original Ameblo publication: 2023-06-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12808933388.html

[Article / Designs] ‘Considerations on Assessing Creative Difficulty’ (Patent Attorney Masato Sasaki) (Patent, 2021, Vol. 74, No. 3)

Some judgments assess creative difficulty separately for each difference, based on the ‘novelty or originality of the design concept’ identified through that difference, while others assess it on the basis of the design's overall configuration.

[Article] ‘Novelty and Effects of Use Inventions’ (Patent, March 2021) (Former Judge Shigeru Osuga)

Original Ameblo publication: 2023-06-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12808933489.html

[Article] ‘Novelty and Effects of Use Inventions’ (Patent, March 2021) (Former Judge Shigeru Osuga)

The article examines important cases concerning novelty and the technical scope of use inventions, and introduces influential scholarly views.

The author argues that, to protect the public domain (PD), incidental uses that are neither publicly known as a technical matter nor publicly practiced should be addressed through appropriate adjustments at the enforcement stage, rather than as a question of novelty.

Novelty and Effects of Use Inventions—In Light of Scholarly Views Emphasizing Protection of the Public Domain—(jpaa-patent.info)

[Article] Examples of Strategic Use of Divisional Applications (Patent Attorney Mamoru Suzuki and Attorney Tomoaki Yasui) (Patent, 2020, Vol. 73, No. 1)

Original Ameblo publication: 2023-06-23

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12809136567.html

[Article] Examples of Strategic Use of Divisional Applications (Patent Attorney Mamoru Suzuki and Attorney Tomoaki Yasui) (Patent, 2020, Vol. 73, No. 1)

Example 2: Sibling divisional applications pursued claims covering the defendant's products or design changes while preserving an application directed to the original invention to keep prosecution pending.

Example 5: The divisional family includes a registered child application whose intermediate parent application was withdrawn.

Example 6: A divisional was tailored to the defendant's product, and the drawings were also changed.

[Article / General] ‘My Bookshelf (Books Useful for Patent Practice and Japanese-Language Information Sources)’ — Corporate Legal Affairs A to Z, June 2023

Original Ameblo publication: 2023-06-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12809338876.html

[Article / General] ‘My Bookshelf (Books Useful for Patent Practice and Japanese-Language Information Sources)’ (Corporate Legal Affairs A to Z, June 2023 issue) *I reproduce my article with permission from Dai-Ichi Hoki.

My specialties are patents and designs, and I have written case-law encyclopedias covering important decisions in each field. Patent practice, in particular, combines technology and law. It is also unusual among areas of administrative litigation in that a substantial proportion of JPO decisions are overturned by the courts (for example, among patent cases in revocation actions that reached judgment in 2022, 18.2% for ex parte appeals and 20.0% for inter partes trials), so a practitioner cannot discuss patent practice independently of patent case law. On the other hand, even though Japanese patent filings are declining, there are still approximately 300,000 applications annually, with approximately 230,000 applications annually subject to requests for examination, compared with only about 150 patent-infringement suits per year. Since a patent right arises only upon registration following allowance, examination at the JPO may superficially account for 99.9% of the time devoted to patent practice. Even without reaching the 0.1% of cases litigated, however, patents provide deterrence and are used in cross-licensing. Unlike other fields of law, judicial trends on patent-law issues change over periods of a few years. The JPO's Examination Guidelines and Handbook are likewise revised every few years in response to recent decisions, so they align on most issues.

(1) JPO Examination Guidelines and Handbook (including the accompanying case examples)

These set out the substantive and procedural policies followed by examiners on all patent-law issues. For JPO procedures, following the Guidelines and related materials will generally keep one on the right track; when uncertain, one can also telephone the JPO with questions. On substantive law, however, some issues diverge somewhat from the majority of court decisions. Arguments in court, in JPO trial and appeal proceedings, and when enforcing patents must follow the case law. If the aim is to obtain a patent at the examination stage without proceeding to appeal, however, one sets aside the court-oriented approach and develops arguments wholly aligned with the Examination Guidelines. (The same applies to designs and trademarks.)

<Audience> All patent practitioners

<Use> Examination practice at the JPO (case law takes precedence in litigation and trial/appeal proceedings)

(2) Industrial Property Laws: Article-by-Article Commentary [20th Edition], edited by the JPO

This provides the JPO's interpretation of every provision of the Patent Act. Its explanations are limited to matters on which disagreement with the courts is not expected, so it does not explain issues disputed in practice and often does not resolve practical uncertainty; it is a substantial, 2,132-page volume. Conversely, the matters it does explain can be checked as an indication that there is generally no practical dispute. In that sense, advanced practitioners are unlikely to be unfamiliar with its contents. Nevertheless, because matters stated in the Commentary carry persuasive weight, it is a book one constantly consults in examination, trial/appeal, litigation, negotiation, and other practice. (The same applies to designs and trademarks.)

<Audience> All patent practitioners (essential for beginners)

<Use> An indication that there is generally no practical dispute on the issue

(3) Patent Filing Strategies and Examination Response Practice for Japan, the United States, Europe, and China (Revised Edition) (Patent Attorney Kenji Tachibana)

Businesses using patents operate globally, and protection is often sought in Japan, the United States, Europe, China, and Korea. It is therefore important to consult not only Japan's Examination Guidelines but also the U.S. MPEP, European patent-examination guidelines, China's examination guidelines and Supreme People's Court explanations, and Korea's Examination Guidelines, and to understand, issue by issue, their differences from Japanese guidelines and related materials. Japanese translations of each are published, and I prepare comparison tables for each issue. There are, however, national patent-office practices that cannot be discerned from the text of their examination guidelines alone. This book explains approaches to dealing with the patent offices in Japan, the United States, Europe, and China, drawing on experience with examination of numerous foreign applications, and is a bible for practitioners involved in foreign filings. The free email newsletter published by LEXIA Partners, where Patent Attorney Tachibana practices, provides even more practice-oriented content.

<Audience> Those involved in foreign filings (intermediate and advanced practitioners)

<Use> Understand, issue by issue, differences between foreign examination practice and Japan's Examination Guidelines and related materials

(4) Encyclopedia of Patent Case Law [3rd Edition] (Hideki Takaishi, Attorney-at-Law, Patent Attorney, and California Attorney)

An encyclopedic book classifying important Japanese patent decisions by issue and by whether they favor or disfavor the right holder. For example, when an issue such as ‘inventive step of parameter inventions’ arises in practice and one wishes to check the case law, reviewing the cases listed under that issue enables either the patentee or the alleged infringer to identify decisions favorable and unfavorable to its company, as well as changes in trends over time. Important passages from judgments are quoted, with the critical portions in red for at-a-glance understanding. Each case also carries a brief description, making it easy to see which cases within an issue should be checked. (The same applies to the Encyclopedia of Design Case Law.)

<Audience> Advanced practitioners able to begin with the issue in patent practice

<Use> Identify cases favorable/unfavorable to one's company on issues arising in practice, and develop strategy and tactics

(5) New Commentary on the Patent Act [2nd Edition]

The most substantial book on patents (in three volumes). Scholars, attorneys, and patent attorneys explain the Patent Act provision by provision in detail, introducing scholarly views as well as case law. It is valuable when comprehensively organizing scholarly views, such as where lower-court decisions diverge or when petitioning the Supreme Court to accept a final appeal. It is also essential when a less common issue with little accumulated case law arises in practice (for example, compulsory licenses or the presumption concerning a manufacturing process) and is not covered in the Article-by-Article Commentary, because arguments then need to be developed by reference to scholarship.

<Audience> Advanced practitioners

<Use> Check scholarly views on less common issues with little accumulated case law

(6) Theory and Practice of Orders to Produce Documents [2nd Edition]

In court, the patentee must identify the defendant's product/process and prove that it satisfies the technical scope of the patented invention. This is often difficult for apparatus inside the defendant's factory or B-to-B products. Patentees therefore apply for orders to produce documents (Code of Civil Procedure, Article 220; Patent Act, Article 105), but in patent cases these are often denied for insufficient prima facie showing of

infringement. (The inspection system effective from October 2020 has a higher threshold than document-production orders.) Nevertheless, courts often convey to defendants their provisional view that a case warrants a document-production order, and defendants then submit evidence voluntarily. Understanding the theory and practice of document-production orders in court is therefore important in practice. (The same applies to IP cases other than patents.)

<Audience> Attorneys and those handling litigation

<Use> Establish a strategy for arguments and proof in court

(7) Other Japanese-Language Information Sources Useful for Patent Practice

(i) ‘Random Thoughts on European IP Practice’ (Kan Hasegawa, Japanese and German Patent Attorney) https://hasegawa-ip.com

Kan Hasegawa, who qualified as a Japanese patent attorney and also obtained the German qualification, generously shares knowledge of European patents acquired through patent-filing practice at a German firm. As a Japanese-language source for learning European patent practice, it is ideal and provides firsthand information.

(ii) ‘Open Legal Community’ (Koji Noguchi, U.S. Patent Attorney)

https://openlegalcommunity.com/blog/

U.S. Patent Attorney Koji Noguchi provides the latest information on U.S. patent practice in Japanese, including U.S. Supreme Court and CAFC judgments. The information arrives overwhelmingly faster than magazine articles.

(iii) ‘Pharmaceutical Patent Case Law Blog’ (anonymous / Fubuki) https://www.tokkyoteki.com

In addition to pharmaceutical case law, the blog covers JPO decisions, developments abroad, and rights relating to pharmaceuticals. It is essential reading for IP professionals in the pharmaceutical industry and is frequently cited in academic papers.

(iv) ‘Sotoku Diary’ (anonymous / Sotoku) https://thinkpat.seesaa.net

Introduces carefully selected cases. It considers them from perspectives different from academic papers, taking account of their relationship to other relevant cases, and is an extremely useful, must-read blog for patent practitioners. It is frequently cited in scholars' papers. Many perspectives have been identified only by this blog.

(v) ‘The Crossroads of Patent Law’ (Kohsuke Tanaka, Patent Attorney) https://patent-law.hatenablog.com

Examines cases from perspectives different from academic papers and is an extremely useful, must-read blog for patent practitioners. It is also cited in academic papers.

(vi) ‘IP Guideposts’ (Tadashi Matsushita, Patent Attorney) www.furutani.co.jp/matsushita/001/

A blog comprehensively introducing cases across all IP fields. By posting immediately after judgments are published, without adding commentary, it offers the fastest coverage in Japan. (All IP fields.)

(vii) Attorney Hideki Takaishi's Patent Channel (Hideki Takaishi) https://www.youtube.com/@tokkyo

A YouTube channel explaining patent-law issues through videos. By watching the relevant issue when it arises in practice, one can learn topic by topic. It can also be used to train newcomers assigned to IP departments. (The same applies to designs.)

(viii) Channels useful for IP practice featuring guest speakers

• IP Practice Online (Hiromoto Kashima, Patent Attorney, and Masamune Oshitani, Patent Attorney)

https://www.youtube.com/channel/UC9wUmfwG0y4sYYGh5GApneA

• Chizai Jitsumu Joho Lab. (IP Practice Information Lab.) (Masaharu Takahashi, Patent Attorney) https://chizai-jj-lab.com

• e-patent (Atsushi Nozaki) https://www.youtube.com/@ePatent

特許実務家が参照すべき実務上有用な書籍、その他の日本語の発信

弁護士・弁理士・カリフォルニア州弁護士 高石秀樹

筆者の専門分野は特許および意匠であり、それぞれについて重要裁判例を網羅した裁判例事典を執筆している。特に、特許実務は、技術と法律の融合であることに加えて、特許庁の審決が相当割合（数十％）裁判所で覆されるという行政訴訟としては珍しい状況であるため、実務家としては特許裁判例を離れて実務を語ることができない。他方、日本の特許出願数が減少傾向であるといっても年間約三〇万件あるのに対し、特許権侵害訴訟が年間一五〇件程度にすぎないことを考えると、特許査定を得られない限り権利は存在しない以上、特許実務に費やされる時間は見掛け上特許庁の審査が九九・九％であるかもしれない。もっとも、〇・一％の裁判に至らなくても特許権は抑止力を供し、クロスライセンスに使われる。特許裁判例は、他の法分野と異なり、特許法上の諸論点について裁判例の判断傾向が数年単位で変化する。もっとも、最新裁判例を受けて、特許庁の審査基準やハンドブックも数年ごとに改定されているから、ほとんどの論点で整合する。

特許庁
『特許・実用新案審査基準』❶
『特許・実用新案審査ハンドブック』（附属事例集を含む）（注1）❷

特許法上の全論点について、実体法上・手続法上の、審査官が従う方針が記載されている。特許庁における手続は審査基準等に従えばほぼ間違いがなく、迷ったときは特許庁に電話で質問することもできる。他方、実体法については、多数裁判例と若干ずれている論点もあり、裁判所、特許庁審判で主張するとき、特許権行使時は裁判例に沿って主張する必要があるが、審判に進まずに審査段階で特許化をねらう場合は、裁判所的な考え方を封印して、審査基準に完全に沿った主張を展開することとなる（意匠、商標も同じ）。

特許庁編
『工業所有権法（産業財産権法）逐条解説（第二二版）』❸

特許法の全条文について、特許庁の解釈が示されている。裁判所と見解が分かれることがないと見込まれる事項に絞って解説されているため、実務上争いがある論点は解説がなく、実務上の迷いを解決できる場合は多くない。逆にいえば、逐条解説で解説されている事項は実務上ほぼ争いがないことの指標として確認できる。その意味で、上級者は内容を知らないということはないが、逐条解説に記載されている事項は説得力があるため、審査、審判、裁判、交渉等の実務において常に確認する書籍である（意匠、商標も同じ）。

立花顕治著
『日米欧中に対応した特許出願戦略と審査対応実務（改訂版）』❹

特許権はグローバルであるから、日米欧中韓で権利化を目指すことが多い。そうすると、日本の審査基準のみならず、米国MPEP（特許審査便覧）、欧州特許審査ガイドライン、中国審査指南および最高人民法院の解説、韓国の審査基準を確認し、各論点ごとに日本の審査基準等との相違点を把握することが重要である。それぞれの日本語訳が公表されているから、私は論点ごとの対比表を作成しているが、各国審査基準の文章のみからは読み取れない各国特許庁実務が存在する。本書は、多数の外国出願における審査も踏まえた日米欧中の特許庁の特許庁対応方針が解説されており、諸外国出願に携わる実務家のバイブルである。著者である立花弁理士所属のレクシア特許法律事務所が発行する無料メールマガジンもさらに実務的なコンテンツを提供している。

高石秀樹著
『論点別 特許裁判例事典（第三版）』❺

日本の重要特許裁判例を、論点ごとに権利者有利・不利という視点から分類した事典的書籍。例えば、実務で「パラメータ発明の進歩性」という論点が問題となり、裁判例を確認したいときは、同論点の項目に上がっている裁判例群を確認することにより、権利者側であっても、被疑侵害者側であっても、自社に有利な裁判例、不利な裁判例を把握することが可能となり、時期的なトレンドの変化も把握できる。判決文中の重要箇所を引用し、核心的部分を赤字にしたため一目で理解できる。各裁判例を一言でまとめた説明が付されているため、各論点中のどの裁判例について確認すればよいかもわか

特集
my法務BOOKs 私の書棚

りやすい（高石秀樹著、吉田和彦監修『論点別 意匠裁判例事典』（経済産業調査会、二〇二〇年）⑤も同じ）。

中山信弘・小泉直樹編「新・注解特許法（第二版）」⑦

特許に関する最も厚い書（三分冊）。学者、弁護士、弁理士が特許法の条文ごとに詳述した書籍であり、裁判例に加えて、諸学説まで紹介されている。下級審裁判例が割れているとき、最高裁に上告受理申立てをするときに、学説まで網羅的に整理する場面において重宝する。また、マイナーな論点で裁判例が蓄積していない論点が実務で問題となったとき（例えば、強制実施権、製造方法の推定など）、逐条解説に記載がないときは、学説に依拠した議論を展開する必要があるため、必読である。

山本和彦・須藤典明・片山英二・伊藤尚編「文書提出命令の理論と実務（第二版）」⑥

裁判所においては、特許権が被告製品／方法を特定し、特許発明の技術的範囲を充足することを立証する必要があるところ、被告工場内の装置や、BtoB製品では特許権者がこれを特定することは困難である場合が多い。そのため、特許権者としては裁判所に文書提出命令（民事訴訟法220条、特許法105条）を申し立てるが、特許事件においては侵害の疎明が足りないとして否定されることも多い（二〇二〇年に査証制度が導入されたが、文書提出命令よりもハードルが高い）。もっとも、裁判所が文書提出命令を発令する事案である旨の心証を被告に伝え、被告が任意に証拠を提出することも多いため、裁判所における文書提出命令の理論と実務を把握することは、実務上重要である（特許以外の知財事件も同じ）。

その他の特許実務上有用な日本語の発信

長谷川寛「徒然なるままに欧州知財実務」（注2）

日本弁理士資格を有し、ドイツ弁理士資格も取得し欧州特許訴訟代理人としても登録されている長谷川寛先生が、ドイツの事務所で特許出願実務を遂行する中で得た欧州特許に関する知見を惜しみなく提供している。欧州特許実務を日本語で学習する情報源としては、一次情報でもあり最適である。

野口剛史「Open Legal Community」（注3）

English text accompanying the published pages

My Bookshelf — Books Patent Practitioners Should Consult and Other Japanese-Language Information Sources. Hideki Takaishi, attorney-at-law, patent attorney, and California attorney. Corporate Legal Affairs A to Z, June 2023, pp. 16–17.

The article reproduced in these two pages corresponds to the English article text above. The author profile and the additional bibliographic details printed in the pages are translated below.

Author profile: Hideki Takaishi. Graduated from the Faculty of Engineering, Tokyo Institute of Technology, and completed graduate studies at the same institution. Attorney-at-law (55th class), patent attorney, graduate of Duke Law, California attorney, and successful candidate in the U.S. patent-agent

examination. Partner at Nakamura & Partners. He comprehensively researches patent and design decisions and has published Encyclopedia of Patent Case Law by Issue (Third Edition) (Keizai Sangyo Chosakai, 2022) and Encyclopedia of Design Case Law by Issue (Keizai Sangyo Chosakai, 2020). He also publishes information on one patent decision or similar matter each day on social media (Twitter, Facebook, and Ameblo). He operates the YouTube channel Attorney Hideki Takaishi's Patent Channel, explaining important patent and design issues in videos of approximately ten minutes.

Additional bibliographic details in the original pages: Industrial Property Laws: Article-by-Article Commentary [20th Edition], JPO (Hatsumei Suishin Kyokai); Patent Filing Strategies and Examination Response Practice for Japan, the United States, Europe, and China, revised edition, Kenji Tachibana (CHUOKEIZAI-SHA); Encyclopedia of Patent Case Law by Issue, Third Edition, Hideki Takaishi (Keizai Sangyo Chosakai, 2022); New Commentary on the Patent Act, Second Edition, edited by Nobuhiro Nakayama and Naoki Koizumi; Theory and Practice of Orders to Produce Documents, Second Edition, edited by Kazuhiko Yamamoto, Noriaki Sudou, Eiji Katayama, and Hisashi Ito.

Printed series headings: Latest BOOKS — My Bookshelf. Intellectual Property Library.

IP High Court, 2022 (Gyo-Ke) 10092 [Program] <Shoji> — Intermediate generalization held not to add new matter

Original Ameblo publication: 2023-06-26

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12809491228.html

2022 (Gyo-Ke) 10092 [Program] <Shoji> — Intermediate generalization held not to add new matter

*A case in which an amendment claiming a broader concept based on specific original disclosure, in light of common general technical knowledge at filing (intermediate generalization), was held not to add new matter.

⇒ The JPO decision finding a violation of Patent Act Article 17-2(3) was revoked!!

[Second Amendment] = ‘Strength’ in the game was narrowed not to the expressly disclosed ‘sum of attack power and defensive power,’ but to the intermediate concept (broader than the specific disclosure) ‘strength, a predetermined parameter whose higher numerical value enables more advantageous progress in the competitive game.’

[Claim 1 (after the Second Amendment)] …A program …determining the user's strength stage among stages defined by lower and upper limits of strength, a predetermined parameter whose higher numerical value enables more advantageous progress in the competitive game…. (*The underlined portion was added in the Second Amendment.)

(Excerpt from the court's reasoning)

…The invention described in the original specification, etc. and that described after the Second Amendment address the same problem and have the same technical significance…. …Regarding common general technical knowledge in the ‘game’ field, it was common knowledge at filing that a ‘user's’ ‘strength’ includes, in addition to attack and defensive power, stamina, agility, the number of items held, and the like…. …In light of the invention's technical significance—selecting an opponent appropriate for the user rather than one differing greatly in strength—it is appropriate to understand ‘strength’ in the original specification, etc. as an indicator of a user's strength in the game, requiring only a parameter affecting victory or defeat. Defining ‘strength’ as the ‘sum of attack power and defensive power’ may be one embodiment, but no reason can be found for deliberately excluding stamina, agility, the number of items held, and other elements commonly understood to constitute ‘strength,’ and limiting it to that sum. Put differently, whether ‘strength’ is limited to the ‘sum of attack power and defensive power’ is merely an optional, additional matter that may or may not be adopted in light of the invention's technical significance….

Cf. Examination Handbook for Patent and Utility Model, Annex A, “Case Examples of Amendments Adding New Matter,” Example 7.

⇒ In Example 7, the shape of the molding surface is treated as an optional additional element because it is not directly related to solving the problem or indispensable to the solution. Deleting that limitation is therefore considered not to introduce new technical matter.

2022 (Gyo-Ke) 10009 [Gas Fire-Extinguishing Equipment] <Otaka>

Even if a feature of the secondary reference (a rupture disk) could be adopted to solve the primary reference's problem (preventing room pressurization), another solution (staggering cylinder-valve opening times to release gas sequentially from multiple cylinders) was not readily conceivable.

(Excerpt from the court's reasoning)

The ‘cylinder valve’ on the nitrogen-gas storage cylinder described in Exhibit Ko 1 and the ‘rupture disk’ of the technical matters in Exhibit Ko 2 differ in operation and function. Neither Exhibit Ko 1 nor Exhibit Ko 2 describes or suggests preventing pressurization of a protected area or room by staggering the opening and closing times of storage-cylinder valves or gas-cylinder valves to release gas sequentially from multiple cylinders. In light of these matters, even if a person skilled in the art encountering Exhibits Ko 1 and Ko 2 might consider applying the rupture disk described in Exhibit Ko 2 to the Exhibit Ko 1 invention to prevent pressurization of the protected area or room, it cannot be found that such a person could readily conceive of achieving that result, without a rupture disk, by staggering the opening times of the ‘cylinder valves’ on the respective ‘nitrogen-gas storage cylinders’ to release gas sequentially from multiple cylinders.

[Article] Settlement of Pharmaceutical Patent Disputes and Antitrust Law (Naoko Mariyama, September 2021)

Original Ameblo publication: 2023-06-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12809785175.html

[Article] Settlement of Pharmaceutical Patent Disputes and Antitrust Law (Naoko Mariyama, September 2021)

U.S. Supreme Court, Actavis — Potential justifications for a reverse payment include litigation expenses avoided through settlement and fair value for services that the generic manufacturer provides to the originator.

⇒ The article, published in September 2021, states that such agreements had not previously been taken up as violations in Japan. The Japan Fair Trade Commission's website publishes a joint research report describing reverse-payment cases in Europe and the United States and recommending stronger monitoring in Japan.

IP High Court, 2021 (Gyo-Ke) 10027 [Information Providing Apparatus] <Otaka>

Original Ameblo publication: 2023-06-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12809923843.html

2021 (Gyo-Ke) 10027 [Information Providing Apparatus] <Otaka>

Changing information processing over a network to processing solely on the user terminal is not invariably a design matter regardless of the service's content.

⇒ No motivation was found to change to a standalone information-providing apparatus; the change was therefore not readily conceivable.

(Excerpt from the court's reasoning)

In general, when providing an information service, performing the necessary processing through an entire system including a server, as opposed to performing it solely on the user terminal, cannot be said to be freely selectable irrespective of the service's content. Nor is there any recognized necessity or rational basis for a person skilled in the art to modify the ‘learning/life support system 1’ of the Exhibit Ko 1 invention—which comprises learning/life support server 2 connected over network N and user terminals 3 used by multiple course participants/students, allowing communication among them—so that all processing required by the system is performed on a single user terminal 3. Accordingly, changing that system to a standalone information-providing apparatus cannot be said to fall within ordinary design matters….

Paragraph [0022] of Exhibit Ko 1 merely states that various information stored in the storage unit of learning/life support server 2 may instead be stored on user terminal 3. It neither describes nor suggests providing the server's other functions on the user terminal. Thus, no motivation can be found for a person skilled in the art encountering Exhibit Ko 1 to replace the entire configuration of its ‘learning/life support system 1’ with a standalone information-providing apparatus. It cannot therefore be found that such a person could readily have conceived of the configuration of Invention 1 corresponding to Difference 3. … The invention cannot be said to have been readily made by a person skilled in the art….

IP High Court, 2016 (Ne) 10093 [Cosmetic for … Skin Care] <Shimizu>

Original Ameblo publication: 2023-06-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12810053036.html

2016 (Ne) 10093 [Cosmetic for … Skin Care] <Shimizu>

‘…Even if the citric acid functions as an astringent, this does not affect the conclusion that it satisfies the “pH adjuster” limitation.’

*Ultimately, the invalidity defense succeeded.

(Excerpt from the court's reasoning)

The appellant argues that the webpages in Exhibits Otsu 34 and Otsu 35 are merely articles by anonymous persons calling themselves ‘Yokko’ and ‘*Ihasa*,’ respectively, with no substantiation of their accuracy or reliability. As to publication dates, both the blog article in Exhibit Otsu 34 and the review in Exhibit Otsu 35 could readily have their past content edited at any time…. …It is therefore doubtful that they were actually …publicly accessible, and the Exhibit Otsu 34 webpage does not deserve to be admitted as evidence.

However, before this patent application, disclosure of all cosmetic ingredients was mandatory…, and the appellant does not dispute the accuracy of the full ingredient list of its former product on the Exhibit Otsu 34 webpage. Nor does it make any specific allegation, such as that the webpage's author could not have consulted the complete ingredient list of that product, which was released on January 15, 2007, before the patent application. Furthermore, the Exhibit Otsu 34 and Otsu 35 webpages are different pages, with different author pen names, and were written by different people. The full ingredient lists of the appellant's former product agree in both ingredient names and order. Taking these matters into account, it is natural and reasonable to conclude that both authors consulted the complete ingredient labeling on the former product's container or the like. Since multiple different persons thus consulted that ingredient labeling, it can be inferred that the Exhibit Otsu 34 webpage was written on January 17, 2007 (Exhibit Otsu 34), after the product's January 15 release, even if the possibility of later alteration cannot be entirely excluded…. …

The invention at issue and the Exhibit Otsu 34 invention differ in that the former specifies a pH range of 5.0–7.5, whereas the latter does not specify pH, and agree in all other respects. …Before the patent application, setting cosmetic pH within the weakly acidic to weakly alkaline range was common general technical knowledge. Giving the Exhibit Otsu 34 invention, a cosmetic with unspecified pH, a weakly acidic to weakly alkaline pH is therefore a matter that a person skilled in the art could appropriately select. Moreover, given that cosmetics are often made weakly acidic like the skin's surface, choosing any value within ‘5.0–7.5,’ itself within that range, would not have been particularly difficult and would have been within ordinary selection by a person skilled in the art….

The appellant argues that, because the Exhibit Otsu 34 webpage lists all ingredients of its former product, a person skilled in the art would recognize the disclosure as concerning that concrete, specific product. The Exhibit Otsu 34 invention should therefore be identified as containing every listed ingredient and as having the former product's pH (7.9–8.3). However, the webpage does not state the pH of that specific product or the quantity of each ingredient. Even taking account of common general technical knowledge at filing, its disclosure cannot be understood to identify a cosmetic serum with a specific pH. In other words, the complete ingredient information disclosed there yields only an invention of a ‘skin-care cosmetic’ containing each listed ingredient, but with unknown ingredient quantities and unknown pH. The appellant's argument amounts merely to saying that testing the former product itself would reveal its pH. Even in light

of common general technical knowledge, it cannot be found that the webpage's content itself permits a conclusion that the skin-care cosmetic has a pH of 7.9–8.3.

[Trademarks] IP High Court, 2022 (Gyo-Ke) 10122 <Honda> — ‘Sakuhoku Curry’ case

Original Ameblo publication: 2023-06-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12810113612.html

[Trademarks] 2022 (Gyo-Ke) 10122 <Honda> — ‘Sakuhoku Curry’ case

A case in which separate observation and examination of the essential part of a composite trademark led to comparison of ‘朔北’ (Sakuhoku) in the applied-for mark ‘朔北カレー’ (Sakuhoku Curry) with the cited mark ‘サクホク’ (Sakuhoku). The court found them dissimilar (Trademark Act, Article 4(1)(xi), inapplicable) and revoked the refusal decision that had found them similar (and the provision applicable).

(Excerpt from the court's reasoning)

(a) Appearance

The essential part of the applied-for mark comprises the two kanji ‘朔北,’ whereas the cited mark comprises the four katakana ‘サクホク.’ Their appearances are clearly different.

(b) Sound

The essential part of the applied-for mark is pronounced ‘sakuhoku,’ and the cited mark is also pronounced ‘sakuhoku’; they are identical in sound.

(c) Concept

The essential part of the applied-for mark evokes ‘the northern direction’ or ‘a northern land.’ In contrast, ‘サクホク’ is a coined word not listed in dictionaries and evokes no particular concept. Their concepts are clearly different.

(d) As explained above, although the essential part of the applied-for mark and the cited mark share the same sound, they clearly differ in appearance and concept. There are no actual trading circumstances in which consumers or traders associate ‘朔北’ with the cited mark ‘サクホク’ or its owner. Nor can it be found that, for the designated goods of these marks, consumers or traders identify goods and their source solely by pronunciation. Distinctiveness based on sound therefore cannot be said to outweigh distinctiveness based on appearance and concept. Accordingly, use of the applied-for mark and the cited mark on identical or similar goods cannot be said to create a likelihood of confusion concerning source. The applied-for mark therefore cannot be regarded as similar to the cited mark.

Osaka District Court, 2015 (Wa) 4292 (the first-instance judgment underlying the Grand Panel judgment) [Carbon Dioxide-Containing Viscous Composition]

Original Ameblo publication: 2023-07-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12810335103.html

Osaka District Court, 2015 (Wa) 4292 (the first-instance judgment underlying the Grand Panel judgment) [Carbon Dioxide-Containing Viscous Composition]

<Damages> Rebuttal of the presumption under Article 102(2) rejected

① There is insufficient evidence to establish that the effects and efficacy of carbon dioxide on the skin differ substantially between the plaintiff's and defendant's products.

② Advertising for the defendant's products emphasized their ability to achieve improvements in cosmetic skin problems and localized obesity through carbon dioxide, which considerably influenced consumers' purchase motivations.

③ There is insufficient evidence to establish that the defendant's products fall within the technical scope of inventions covered by the plaintiff's patents other than the patents at issue.

④ For a competing product to constitute a ground for rebutting the presumption, it must have effects equivalent to those of the patents at issue and compete as an equivalent alternative for consumers, the relevant customers.

⑤ There was a factor teaching away from combining the common general technical knowledge asserted by the defendant with the prior art, and the combination cannot be found to have been easily conceivable. The technical value of the inventions at issue therefore cannot be said to be low.

IP High Court (Grand Panel), 2018 (Ne) No. 10063, judgment of June 7, 2019 (Presiding Judge Takabe) <Damages>

Original Ameblo publication: 2023-07-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12810340433.html

IP High Court (Grand Panel), 2018 (Ne) No. 10063, judgment of June 7, 2019 (Presiding Judge Takabe) <Damages>

[Carbon Dioxide-Containing Viscous Composition] <Damages> Rebuttal of the presumption under Article 102(2) rejected

<General principles>

"These are understood to be circumstances that disrupt an adequate causal relationship between the profits obtained by the infringer and the damage suffered by the patentee. Examples include: ① differences in the business models and other circumstances of the patentee and infringer (different markets); ② the existence of competing products in the market; ③ the infringer's sales efforts (brand strength and advertising); and ④ the infringing product's performance (features other than the patented invention, such as functions and design)."

"Where the patented invention is worked in only part of the infringing product ..., this is determined by comprehensively considering such circumstances as the position within the infringing product of the part in which the invention is worked and the invention's customer-attracting power."

<Application to the facts>

• The sales periods, market shares, and other details of the alleged competing products are unknown, and the evidence is insufficient to establish that they compete with the defendant's products in the market.

• Even if ingenuity or sales efforts within the ordinary range were employed, they cannot be regarded as grounds for rebutting the presumption.

• Even if an infringing product has superior efficacy compared with the patentee's product, this does not immediately warrant rebuttal of the presumption; circumstances showing that the superior efficacy contributed to the infringer's sales are necessary.

• Even if an infringing product embodies another patented invention, this does not immediately warrant rebuttal of the presumption; circumstances such as a contribution to sales of the infringing product from working that other patented invention are necessary.

[Patent ★★] Carbon Dioxide-Containing Viscous Composition case: A decision on the calculation of damages and the factors to consider under Article 102(2) and (3) of the Patent Act. - NAKAMURA & PARTNERS (nakapat.gr.jp)

IP High Court (Grand Panel), 2012 (Ne) No. 10015, judgment of February 1, 2013 (Presiding Judge Iimura) <Damages>

Original Ameblo publication: 2023-07-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12810342559.html

IP High Court (Grand Panel), 2012 (Ne) No. 10015, judgment of February 1, 2013 (Presiding Judge Iimura) <Damages>

[Waste Storage Cassette and Waste Storage Device] <Damages> Rebuttal of the presumption under Article 102(2) rejected

• The plaintiff (a foreign company) sells its cassettes in Japan through Combi, and Combi is not the only entity earning profits from sales of the plaintiff's products in Japan.

• It is argued that Product I does not produce the effects of the invention when used with the Mark II main unit, but the number used with the Mark II main unit is unknown and cannot be determined.

• Like the plaintiff's cassettes, Product I is ordinarily used together with the plaintiff's main unit solely for that purpose. (The invention is claimed as a subcombination.)

• The price difference between Product I and the plaintiff's cassette is small (approximately 167 yen per unit).

• Combi, which the plaintiff designated as its distributor in Japan, is not inferior in brand strength in Japan to Aprica (the defendant).

Full judgment (Courts of Japan)

Tokyo District Court, 2020 (Wa) 19221 [Auxiliary Laundry Washing Product] <Kokubu>

Original Ameblo publication: 2023-07-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12810766628.html

Tokyo District Court, 2020 (Wa) 19221 [Auxiliary Laundry Washing Product] <Kokubu>

* A purity of 99.95% was held to fall within "substantially 100% by weight."

* Includes cases in which it is used solely to work the inventions at issue.

⇒ Not a mere standard or general-purpose product.

⇒ Indirect infringement established

Note: Recently, the various requirements of Article 101 have almost always been found satisfied!!

(Extract from the court's reasoning)

The defendant's product consists of "metallic magnesium particles having a purity of approximately 99.95% ..." ...; these are ... "a plurality of metallic magnesium particles" (Configuration c), and thus there are "a plurality" of metallic magnesium particles (Element 1A). ... They fall within "particles containing substantially 100% by weight of elemental metallic magnesium (Mg)" (Element 2A).

The specification states that, as to the composition of metallic magnesium particles used as an auxiliary laundry washing product, particles containing substantially 100% by weight of elemental metallic magnesium (Mg) are more preferred ([0020]), and that an average particle diameter of 4.0–6.0 mm is most preferred for the metallic magnesium particles used as an auxiliary laundry washing product ([0022]). ... The defendant's product satisfies both of these points. It follows that enclosing the defendant's product in a laundry net necessarily completes an auxiliary laundry washing product satisfying the elements of each invention at issue. The defendant's product is therefore found to include cases of use solely to work those inventions ... and cannot be described as a mere standard or general-purpose product.

Intellectual Property High Court, 2021 (Ne) 10099 [Hydrogen Gas Supply Device for Living Organisms] <Kanno>

Original Ameblo publication: 2023-07-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12811056503.html

Intellectual Property High Court, 2021 (Ne) 10099 [Hydrogen Gas Supply Device for Living Organisms] <Kanno>

The difference between Product I and the invention did not concern an essential part (focusing on the generated hydrogen gas ... and maintaining it below a certain concentration outside the explosive range by ...), but there was no motivation to make the substitution.

⇒ The first and second requirements of the doctrine of equivalents were satisfied, but the third was not (the fifth was not addressed)

Note: The third requirement must be considered independently of the essential part!!

(Extract from the court's reasoning)

In Corrected Invention 6, "an electrolytic chamber into which raw water to be electrolyzed is introduced" refers to a chamber whose interior and exterior are completely separated by a diaphragm so that water does not communicate between the inside and outside, allowing them to remain separate, independent states. ...

Corrected Invention 6 focuses on the generated hydrogen gas and maintains it below a certain concentration outside the explosive range by blowing a diluting gas onto the cathode or the cathode water surface. This should be regarded as the essential part of Corrected Invention 6. Therefore ... because it does not concern the hydrogen gas concentration, it cannot be said to replace an essential part. Accordingly, Defendant's Product 1 satisfies the first requirement for equivalence.

... Defendant's Product 1 also blows air onto the cathode water surface approximately 6 cm above the cathode, and supplies a living organism with a mixed gas containing hydrogen gas and air at a hydrogen gas concentration of 2.6 vol%. It can therefore be said to produce the same effect as Corrected Invention 6. Accordingly, Defendant's Product 1 satisfies the second requirement. ...

None of the well-known technologies asserted by the appellant can be regarded as providing motivation to replace the configuration of "one or more diaphragms separating the inside and outside of the electrolytic chamber" in Corrected Invention 6 with the configuration of "① part of the side wall of inner tank 6, ② the bottom of inner tank 6 having outflow hole 3, and ③ four polymer membranes 10" in Defendant's Product 1. On these facts, such a substitution cannot be said to have been easy, and Defendant's Product 1 does not satisfy the third requirement for equivalence.

[Copyright] Intellectual Property High Court, 2022 (Ne) 10059

Original Ameblo publication: 2023-07-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12811246567.html

[Copyright] Intellectual Property High Court, 2022 (Ne) 10059

A post-termination noncompete clause in an exclusive management agreement between a music agency and performers (a band)

⇒ Although the noncompete period was six months, it was unrelated to recovery of upfront investment

⇒ Contrary to public policy

Note: Noncompete obligations upon leaving employment are a separate issue because confidentiality is involved.

I think there is often a need to recover upfront investment. Even then, just as an acceptable noncompete period varies with the type of work, the period that does not violate public policy will vary according to the need to recover the upfront investment.

I am not speaking specifically about this case. My point is that, just as the threshold for violating public policy in noncompete cases differs by type of work, where there is a need for "recovery of upfront investment," as discussed in this case, the threshold will likely differ depending on the degree of that need.

[Patent] Different novelty determinations on the same patent and the same cited reference by the same division on the same day. A rebuttal to the invalidity defense based on claim correction rejected as untimely.

Original Ameblo publication: 2023-07-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12811616256.html

[Patent] IP High Court judgments by the same division on the same day, involving the same patent and the same cited reference (an action to revoke a JPO trial decision and an appeal in an infringement action) **that reached different conclusions on novelty. A case in which a rebuttal to the invalidity defense based on claim correction was rejected as untimely.**

(1) Judgment in the action to revoke a JPO trial decision finding novelty ⇒ Inventive step also upheld

Judgment delivered November 29, 2022 **[Information Providing Device] case**

Intellectual Property High Court, 2021 **(Gyo-Ke)** No. 10027 <Otaka>

Oral argument concluded September 22, 2022

091607_hanrei.pdf (courts.go.jp)

Patent No. 6538097

Primary cited reference: Japanese Unexamined Patent Application Publication No. 2015-102994 (Exhibit Ko 1)

⇒ The JPO decision held that the "learning and daily-life support system 1" of the Ko 1 invention differed from the "information providing device" of the invention at issue.

⇒ The judgment was the same. (It upheld the JPO decision finding novelty. Inventive step was also upheld.)

(Quotation from the judgment) The "learning and daily-life support system 1" of the Ko 1 invention "comprises a learning and daily-life support server 2 connected via a network N, and user terminals 3 used by multiple course participants and students." It comprises multiple elements (devices) and therefore differs from the "information providing device" of Invention 1, which, as stated above, means a single device. Accordingly, there is no error in the JPO decision's finding of Difference 3.

(2) Judgment on appeal in the infringement action finding lack of novelty

Judgment delivered November 29, 2022 **[Information Providing Device] case**

Intellectual Property High Court, 2022 **(Ne)** No. 10008 <Otaka> (first instance: Tokyo District Court, 2019 (Wa) No. 25121 <Tanaka>)

Oral argument concluded September 22, 2022

091603_hanrei.pdf (courts.go.jp)

Patent No. 6538097

Primary cited reference: Japanese Unexamined Patent Application Publication No. 2015-102994 (Exhibit Otsu 8)

⇒ The defendant (appellee), taking into account **the point identified as a difference in the JPO decision—that the invention's "information providing device" is a single device**—asserted the "invention of a learning and daily-life support server" (Otsu 8 Invention 1) as a supplementary argument on appeal in the infringement action. In short, taking into account that the cited reference's "learning and daily-life support system 1" had been distinguished because it included both a "learning and daily-life support server 2" and "user terminals 3," unlike in the invalidation trial, **it successfully converted that difference into a**

common feature by redoing the comparison using only the "learning and daily-life support server 2" as the cited prior art!!

Note: The first-instance judgment, however, also compared it with the "learning and daily-life support server of the Otsu 8 invention"; the comparison was not changed only on appeal.

<Some observations>

(1) Identification of the cited invention (limits on generalizing or particularizing a cited invention; here, the limits on particularization)

To avoid a difference between a single element and multiple elements, where the cited reference contained multiple elements, the comparison was narrowed to the single element needed for comparison with the invention, successfully turning a difference into a common feature. (Like teaching-away factors and switching the primary and secondary references, this is one type of case in which novelty and inventive-step determinations may differ depending on the reasoning even with the same cited reference.)

Of course, there is the question of whether a cited reference′ confined to a single element can be identified from the cited reference (the limits on generalizing or particularizing the cited invention; here, the limits on particularization). In this case, partly because the plaintiff was self-represented, it did not raise the issue of "identification of the cited invention" or thoroughly contest whether the cited invention called "Otsu 8 Invention 1" could be identified—that is, whether the primary reference could be understood to disclose only the "learning and daily-life support server 2" as the primary cited invention, disregarding the "user terminals 3," rather than the "learning and daily-life support system 1."

A review of the case law indicates that the limits on generalizing or particularizing cited inventions in novelty and inventive-step assessments depend on whether one can discern, from the cited reference (or publicly worked products, etc.), **"a coherent body of technical matters"**. This parallels the analysis of the disclosure in the specification when determining whether new matter has been added.

(2) Rejection as untimely (new arguments after submission of the statement of reasons for appeal)

The patentee did not raise a rebuttal to the invalidity defense based on claim correction at the initial stage of the infringement appeal (by submission of the statement of reasons for appeal). It raised the rebuttal at the first oral argument hearing on September 22, 2022, on the basis of its fourth preparatory brief dated September 5. On the appellee’s application, the court rejected it as an untimely means of attack or defense.

Since there had been a JPO decision maintaining the patent and finding novelty and inventive step over the same primary cited reference, one can understand the patentee's strategy of challenging the matter without raising a rebuttal to the invalidity defense based on claim correction, hoping that novelty and inventive step would be recognized without correction. The judgment may thus seem harsh. However, regarding the decisive "Difference 3" on which the JPO based its decision to maintain the patent (novelty and inventive step upheld), the defendant had changed the comparison so that "Difference 3" in that decision became a common feature and argued lack of novelty; the first-instance judgment then found lack of novelty. In those circumstances, it is difficult to call excessively harsh the appellate judgment emphasizing that the patentee had failed to raise its rebuttal to the invalidity defense based on claim correction in a timely manner at first instance or before the written preparatory proceedings on appeal concluded. (In my view, if the patentee was to raise this rebuttal on appeal, it should have done so at the initial stage, by the time it submitted its statement of reasons for appeal. As a tactical matter, it could also have raised a rebuttal to the invalidity defense based on claim correction for only some claims from the outset of the appeal.)

This was an unusual case because a JPO decision maintaining the patent had recognized novelty and inventive step over the same primary cited reference. Generally, however, in cases where new arguments (new invalidity grounds, a rebuttal to the invalidity defense based on claim correction, the doctrine of equivalents, other defenses, etc.) were first raised on appeal, many were not rejected as untimely if raised at the initial stage (by submission of the statement of reasons for appeal). Conversely, many were rejected as untimely if raised after submission of that statement, particularly after the first oral argument hearing on appeal.

In any event, when making new arguments on appeal, they should probably be raised in the statement of reasons for appeal, using such approaches as raising them for only some claims.

[Patent / Utility Model] Tokyo District Court, 2020 (Wa) 15955 <Shibata>

Dwango v. U.S. FC2: IP High Court Grand Panel Judgment (the foreign-server issue, including a comparison with the earlier judgment)

Original Ameblo publication: 2023-07-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12812260523.html

Dwango v. U.S. FC2: Grand Panel Judgment (including a comparison with the earlier case)

— (Earlier case) IP High Court, 2018 (Ne) No. 10077 <Presiding Judge Honda> —

A case in which transmitting a program from a server located abroad to users in Japan was assessed as an act in Japan. The finding on satisfaction of the claim elements was reversed, and the patentee won on appeal.

— (Later case) IP High Court Grand Panel, 2022 (Ne) No. 10046 <Presiding Judge Otaka> —

A case in which U.S. FC2's act of "producing" a "(comment delivery) system" that includes a server located abroad was assessed as an act in Japan. The patentee won on appeal.

[Summary of the IP High Court Grand Panel Judgment and Some Observations (Including a Comparison with the Earlier Case)]

1. Claims (JP6526304 / the patent found infringed in the Grand Panel judgment)

(1) Claim 1

1A A comment delivery system comprising a server and a plurality of terminal devices connected thereto via a network, wherein:

1B the server receives a first comment and a second comment concerning a video, added by users viewing the video transmitted from the server;

1C the server transmits the video and comment information to the terminal devices;

1D the comment information includes the first comment and the second comment, and comment addition times that are video playback times indicating elapsed video time measured from the beginning of the video, corresponding to the times when the first comment and the second comment were respectively added;

1E the system comprises means for displaying on a display device of a terminal device, on the basis of the video and the comment information, the video and the first comment and the second comment moving horizontally while overlapping at least part of the video at the video playback times corresponding to the comment addition times;

1F a determination unit that determines whether the display position at which the second comment is displayed on the one video overlaps the display position of the first comment; and

1G a display position control unit that, when overlap is determined, adjusts the first comment and the second comment to be displayed at positions where they do not overlap, wherein, in the comment delivery system:

1H by the server transmitting the video and the comment information to the terminal devices, the display device of a terminal device displays the video and the first comment and the second comment moving horizontally while overlapping at least part of the video at the video playback times corresponding to the comment addition times, such that the first comment and the second comment do not overlap;

1I comment delivery system.

(2) Claim 2

2A A comment delivery system comprising a video delivery server and a comment delivery server, and a plurality of terminal devices connected thereto via a network, wherein:

2B the comment delivery server receives a first comment and a second comment concerning a video, added by users viewing the video transmitted from the video delivery server;

2C1 the comment delivery server transmits comment information to the terminal devices;

2C2 the video delivery server transmits the video to the terminal devices;

2D the comment information includes the first comment and the second comment, and comment addition times that are video playback times indicating elapsed video time measured from the beginning of the video, corresponding to the times when the first comment and the second comment were respectively added;

2E the system comprises means for displaying on a display device of a terminal device, on the basis of the video and the comment information, the video and the first comment and the second comment moving horizontally while overlapping at least part of the video at the video playback times corresponding to the comment addition times;

2F a determination unit that determines whether the display position at which the second comment is displayed on the one video overlaps the display position of the first comment; and

2G a display position control unit that, when overlap is determined, adjusts the first comment and the second comment to be displayed at positions where they do not overlap, wherein, in the comment delivery system:

2H by the comment delivery server transmitting the comment information and the video delivery server transmitting the video, respectively, to the terminal devices, the display device of a terminal device displays the video and the first comment and the second comment moving horizontally while overlapping at least part of the video at the video playback times corresponding to the comment addition times, such that the first comment and the second comment do not overlap;

2I comment delivery system.

2. The principle of territoriality

(1) First-instance judgment (Tokyo District Court, 2019 (Wa) No. 25152): "Production" in Japan denied

Based on the principle of territoriality, the first-instance court established the rule that, to constitute "production" under Article 2(3)(i) of the Patent Act ("production" in Japan), a product satisfying all claim elements of the patented invention must be newly created in Japan. It then held that the appellees could not be found to have "produced" the defendants' systems in Japan, because all the defendants' servers constituting those systems were in the United States, and the user terminals in Japan alone did not satisfy all claim elements of the invention covered by the patent. (Note: The first-instance court found that the defendants' systems fell within the technical scope of the patented invention, but denied "production" in Japan.)

(2) This judgment (IP High Court Grand Panel): "Production" in Japan affirmed (summary based on the court's case summary)

For an invention such as Invention 1, involving a system in which a server and terminals are connected through a network such as the Internet and perform an integrated function as a whole (a network-type system), "production" is understood to mean the act of newly creating the system by connecting, through the network, multiple elements that individually do not satisfy all claim elements of the invention, so that they have an organic relationship with one another and, as a whole, acquire functions satisfying all claim elements of the invention.

In the FLASH version of Defendants' Service 1, when the user terminal receives the files, Appellee Y1's servers and the user terminal are connected via an Internet-based network, making it possible to display comments overlaid on a video in the user terminal's browser. Accordingly, **Defendants' System 1, equipped with functions satisfying all claim elements of Invention 1, is newly created when the user terminal receives those files**. (This act is referred to below as "Production 1-1".)

In Production 1-1, the transmission of the files from a server in the United States to user terminals in Japan, and the terminals' receipt of them, take place across the United States and Japan. The newly created Defendants' System 1 also exists across the United States and Japan.

In network-type systems, it is now common for servers to be installed outside Japan (abroad). Moreover, the country in which a server exists is no obstacle to using a network-type system. Thus, even if a server is abroad, if a terminal constituting the system is in Japan (domestically), that terminal can be used to utilize the system in Japan, and such use may affect the economic interests that the patentee could obtain by working the invention in Japan. Accordingly, for inventions of network-type systems, it would be inappropriate to construe territoriality strictly and uniformly exclude them from "working" under Article 2(3) of the Japanese Patent Act merely because the server, one constituent element of the system, is abroad. That would make patents easy to evade simply by locating servers abroad and would prevent sufficient protection of patents for such system inventions.

As to whether an act newly creating a network-type system constitutes "production" in Japan, even where a server, one constituent element of the system, is abroad, the specific manner of the act, the functions and roles in the invention of those system elements located in Japan, the place where the invention's effects are obtained through use of the system, and the effects of that use on the patentee's economic interests, among other circumstances, must be considered comprehensively. Where the act can be regarded as having been carried out within Japanese territory, it is appropriate to construe it as "production" under Article 2(3)(i) of the Patent Act.

Production 1-1 occurs through transmission of the files from a server in the United States to user terminals in Japan and receipt of them by those domestic terminals. Transmission and receipt are performed as an integrated whole, and Defendants' System 1 is completed when a domestic user terminal receives the files. Accordingly, that transmission and receipt can conceptually be regarded as taking place in Japan. Next, Defendants' System 1 consists of Appellee Y1's server in the United States and user terminals in Japan. Those domestic terminals perform the functions of the determination unit in Element 1F and the display position control unit in Element 1G, which are necessary to display comments on a video at nonoverlapping positions, a principal function of Invention 1. Furthermore, Defendants' System 1 can be used from within Japan through user terminals. The effect of Invention 1—enhancing the entertainment value of communication using comments—arises in Japan, and domestic use may affect the economic interests that the appellant derives from using the system of Invention 1 in Japan. Considering these circumstances comprehensively, Production 1-1 can be regarded as having been carried out within Japanese territory.

As regards Defendants' System 1, U.S. FC2 installs and manages the web server, video delivery server, and comment delivery server. Those servers transmit HTML files, SWF files, video files, and comment files to user terminals. The terminals receive those files automatically in accordance with the instructions in the

program uploaded to the servers by U.S. FC2, without any separate user operation. Accordingly, the entity that "produced" Defendants' System 1 must be considered to be Appellee Y1 (U.S. FC2).

(3) The appellee's (U.S. FC2's) arguments in the Grand Panel case and the court's reasoning in response

... The appellees argue that: ① Appellee FC2's acts relating to "production" of the defendants' systems consist solely of making the programs corresponding to those systems and uploading them to servers, all of which are completed in the United States. Thereafter, before comments and videos are displayed on user terminals, there are acts of use by users, including uploading comments and videos, but the display device of a user terminal is a general-purpose browser and those acts of use are unrelated to the characteristic parts of the inventions. ② In Defendants' System 1, a user terminal merely passively displays videos and comments in accordance with the instructions in the program uploaded to the server by Appellee FC2, and the content of comments uploaded by third parties to Appellee FC2's server and videos uploaded to Appellee FC2's server (in Defendants' Systems 2 and 3, videos uploaded to third-party servers). Display of videos and comments on a user terminal is merely the result of the user utilizing an already produced device (the defendants' systems) through the terminal's general-purpose browser; there is no act of "newly" "creating" a "product." ③ Exhibit Otsu 311 states: "Generally, communication systems involve transmission and receipt of data. An interpretation of ‘production’ encompassing repeated production and disposal of a first, second, third, ... nth communication system each time data are transmitted or received would mean that the system is reproduced each time data are exchanged within it, and is difficult to adopt." In view of that observation, Appellee FC2's acts should not constitute "production" of Invention 1.

However, regarding ①, **Appellee FC2's merely making the program corresponding to Defendants' System 1 and uploading it to the server does not complete Defendants' System 1 equipped with functions satisfying all claim elements of Invention 1, as described in a above**.

Regarding ②, as stated in a above, Appellee FC2's video delivery server and comment delivery server are connected to the user terminal through an Internet-based network, and **receipt of the necessary files by the user terminal newly creates Defendants' System 1 equipped with functions satisfying all claim elements of Invention 1**. If the user terminal does not receive those files, Defendants' System 1 cannot perform its functions.

Regarding ③, as stated above, Defendants' System 1 is newly created when Appellee FC2's video delivery server and comment delivery server are connected to the user terminal through an Internet-based network and the terminal receives the necessary files. It continues to exist until the files stored in the terminal browser's cache are discarded. Moreover, even if **Defendants' System 1 is created each time those files are received repeatedly**, that fact does not justify concluding that the act is not "production."

Accordingly, the appellees' above arguments are without merit.

3. Comparison with the earlier case (Dwango v. U.S. FC2)

(1) IP High Court, 2018 (Ne) No. 10077 <Presiding Judge Honda> (earlier case)

Some of the patented inventions at issue in the earlier case concerned a "program." As to whether U.S. FC2's act of delivering a "program" from a server it owned in the United States to users located in Japan constituted "provision" under the Japanese Patent Act, the judgment reasoned as follows and held that it constituted (domestic) "provision" under that Act. (Indirect infringement of the "display device" claims was also established.)

"... If infringement of a patent for an invention capable of transmission through a network required ... every act to be completed within Japanese territory even in a formal sense, ... liability for patent infringement could easily be avoided by moving some equipment, such as a server, abroad. ... Allowing such evasive conduct would be gravely contrary to justice. ...

① Whether the provision can clearly and easily be divided into a part taking place outside Japanese territory and a part taking place within it;

② whether control over the provision takes place within Japanese territory;

③ whether the provision is directed at customers or others located within Japanese territory; and

④ whether the effects of the patented invention obtained through the provision arise within Japanese territory, among other circumstances, are to be considered;

where, viewed substantively and as a whole, the provision can be assessed as taking place within Japanese territory, it constitutes "provision" under the Japanese Patent Act—that is the appropriate interpretation."

"…The delivery at issue is initiated and completed when a user located within Japanese territory accesses a website for one of the appellees' services ... ,

① It is difficult to divide the delivery clearly and easily into a part taking place outside Japanese territory and a part within it;

② control over the delivery is exercised by users located within Japanese territory; and

③ the delivery is directed at users located within Japanese territory who wish to view videos. Furthermore,

④ only through the delivery can users located within Japanese territory view ... videos to which comments and the like have been added. The effects of Inventions 1-9 and 1-10 obtained through that delivery arise within Japanese territory.

In light of these circumstances, even if part of the delivery takes place outside Japanese territory, when considered substantively and as a whole, it is appropriate to assess it as having taken place within Japanese territory."

(2) Comparison between the Grand Panel judgment (later case) and the earlier judgment

For provision of a program from a foreign server to Japan, the earlier judgment identified and considered the above factors ①②③④. These factors seem always to be satisfied when a program is transmitted from a foreign server to a user in Japan in response to that user's request. The judgment likewise applied them naturally and recognized provision of the "program" in Japan.

This IP High Court Grand Panel judgment (the later case) calls for comprehensive consideration, even where a server is abroad, of the specific manner of the act, the functions and roles in the invention of the system elements located in Japan, the place where the invention's effects are obtained through use of the system, and the effects of that use on the patentee's economic interests, among other circumstances. The test itself thus remains evaluative and strikes a balance between the patentee and the alleged infringer.

However, the application of "the specific manner" consists of "transmitting the files from a server in the United States to user terminals in Japan, and receipt of them by those domestic terminals, with transmission and receipt being performed as an integrated whole and Defendants' System 1 being completed when a domestic user terminal receives the files"—an abstract description of transmitting and receiving files that always holds true for a cross-border network.

On the other hand, as to "the functions and roles in the invention of the system elements located in Japan", the court stated in its application that "the user terminals located in Japan perform the principal function of Invention 1 of displaying comments on the video at positions where they do not overlap, by performing the necessary functions of the determination unit in Element 1F and the display position control unit in Element 1G". It identifies the fact that an important part relating to the invention's solution to its problem is realized by user terminals in Japan. Arguments concerning the technical significance and essential part of the invention therefore become important. (This type of discussion has something in common, for example, with the way the invention's problem affects the conclusion when discussing the support requirement.) In

any event, under this criterion, network-related inventions generally exhibit the patented invention's functions and roles at the terminal location rather than the server location. The criterion is therefore readily satisfied where the server is abroad and the terminals are in Japan. (Note: Conversely, it is difficult to satisfy where the server is in Japan and the terminals are abroad; but would the court find no domestic working in such a case? Furthermore, it would be necessary to consider whether one would feel any discomfort if a foreign court in that situation found infringement of a patent in that foreign country.)

Next, as to "the place where the invention's effects are obtained through use of the system", this too seems always to be satisfied when a program is transmitted from a foreign server to users in Japan.

Finally, as to "the effects of that use on the patentee's economic interests, among other circumstances", because transmitting a program from a foreign server to users in Japan causes the above "effects" to arise in Japan, this too seems always to be satisfied for a Japanese patentee, particularly one conducting a competing business in Japan.

Thus, among the four factors in the test set out by this IP High Court Grand Panel judgment (the later case), the factor with a major influence on the conclusion is "the functions and roles in the invention of the system elements located in Japan". This is not invariably satisfied when a server is abroad: the server itself may perform important functions and roles, in which case domestic working might be denied. Conversely, even where the server is in Japan and the terminals are abroad, domestic working might be affirmed if the server performs important functions and roles in the invention. As a patent application strategy anticipating that some component, not necessarily the server, will be abroad, there is therefore room to devise claims locating the invention's problem-solving principle in the server, in the terminal device, and in various other configurations. (However, as stated above, network-related inventions generally exhibit the patented invention's functions and roles at the terminal location rather than the server location. The criterion is therefore readily satisfied where the server is abroad and the terminals are in Japan.)

4. Some observations

(1) Appropriateness of the Grand Panel judgment's test and its application (later case)

In the later case, concerning the finding that the appellee (U.S. FC2) was the entity "producing" the system of the patented invention, the court held: "Appellee FC2 installs and manages the above web server, video delivery server, and comment delivery server, and those servers transmit HTML files, SWF files, video files, and comment files to user terminals. The terminals receive those files automatically in accordance with the instructions in the program uploaded to the servers by Appellee FC2, without any separate user operation. In view of this, the entity that ‘produced’ Defendants' System 1 must be considered to be Appellee FC2. ... The users' acts are confined to those performed through browsing webpages managed by Appellee FC2, and the users cannot be assessed as themselves independently carrying out the act of ‘producing’ Defendants' System 1."

There is nothing particularly troubling about treating the appellee (U.S. FC2) as the entity "producing" the patented system. In determining that entity, however, the judgment emphasizes the importance of the servers: "Appellee FC2 installs and manages the above web server, video delivery server, and comment delivery server, and those servers transmit HTML files, SWF files, video files, and comment files to user terminals. The terminals receive those files automatically in accordance with the instructions in the program uploaded to the servers by Appellee FC2, without any separate user operation."

By contrast, in determining how to assess the place of "production" of the patented system, the judgment states: "The user terminals located in Japan perform the functions necessary to display comments on a video at nonoverlapping positions, a principal function of Invention 1: the function of the determination unit in Element 1F and the function of the display position control unit in Element 1G." This emphasizes the importance of the functions and roles of user terminals. In response to the appellee's counterarguments, it also states: "**Appellee FC2's merely making the program corresponding to**

Defendants' System 1 and uploading it to the server does not complete Defendants' System 1 equipped with functions satisfying all claim elements of Invention 1, as described in a above. ... Appellee FC2's video delivery server and comment delivery server are connected to the user terminal via an Internet-based network, and **receipt of the necessary files by the user terminal newly creates Defendants' System 1 with functions satisfying all claim elements of Invention 1**; without receipt of those files by the user terminal, Defendants' System 1 cannot perform its functions." In short, the patented system is not completed by the servers alone; it is completed through "**receipt of the necessary files by the user terminal**", that is, **newly created**. The judgment thus emphasizes the importance of the functions and roles of user terminals.

In this way, with respect to "production" of the patented system, the Grand Panel judgment in the later case (this judgment) emphasizes the servers' importance in identifying the actor, but emphasizes the importance of the functions and roles of user terminals when assessing the place of production. Even if this is not outright contradictory, there is a tension.

(The earlier Dwango judgment rejected a normative theory of conduct treating users' acts as U.S. FC2's acts. Also, although it was a copyright case, **the Supreme Court (First Petty Bench), in its judgment of October 24, 2022 (2021 (Ju) No. 1112)**, rejected a normative theory of conduct treating students' performances as performances by the music school. In light of these decisions, the Grand Panel judgment in this case likewise does not adopt reasoning that treats users' acts as U.S. FC2's acts.)

(2) Extending the reasoning on "provision of a program" in the earlier Dwango judgment to "transfer of tangible goods"

Even previously, numerous judgments in non-use cancellation cases (Trademark Act, Article 50) addressed whether trademark use could be assessed as occurring in Japan in the context of the "foreign-server issue." Where the use was directed at Japanese people, in Japanese, with payment in Japanese yen, it has been assessed as use of the trademark in Japan.

I consider this judgment (the later Dwango case), together with the earlier Dwango case, groundbreaking in introducing a similar value judgment for patents.

Both Dwango cases concern network inventions. They are qualified by statements such as "from the perspective of appropriately protecting patent rights for inventions of network-type systems" (this judgment / the later Dwango case), and "in today's digital society, where numerous useful network-related inventions exist, allowing such evasive conduct would be gravely contrary to justice" (the earlier Dwango case). Whether similar reasoning is appropriate for tangible goods is therefore a separate question.

On the other hand, Article 2(3)(i) of the Patent Act defines working a patented invention as, "in the case of an invention of a product (including a program, etc.; the same applies hereinafter), acts of producing, using, transferring, etc. (meaning transfer or lease, and, where the product is a program, etc., including provision through a telecommunications line; the same applies hereinafter), exporting or importing the product, or offering it for transfer, etc. (including displaying it for the purpose of transfer, etc.; the same applies hereinafter)." Under Japanese patent law, a program is a product and provision of a program falls within "transfer, etc." of a product. There is therefore room to treat provision of a program and transfer of tangible goods as parallel to a certain extent, and the earlier Dwango case may influence cases concerning transfers of tangible goods.

Indeed, looking at case law concerning transfer of tangible goods, **Tokyo District Court, 2016 (Wa) 25436 "Method for Producing L-Glutamic Acid" case <Presiding Judge Yamada>** recognized an "offer for transfer" and ruled for the patentee because, although the place of transfer was abroad (Indonesia), the destination was Japan. Using this Glutamic Acid judgment and the earlier Dwango case as starting points, the limits on extending the reasoning of the Dwango judgments to transfers of tangible goods will likely be debated.

There have also been numerous judgments on the "foreign-server issue" in other countries. Because the results of litigation in different countries influence one another from the perspective of international harmonization as well, constant monitoring is essential.

[Unfair Competition Prevention Act / Communication and Dissemination of False Statements] Tokyo District Court, 2021 (Wa) 18135 ⇒ Claim dismissed on the merits

Intellectual Property High Court, 2022 (Gyo-Ke) 10010 [CNS Delivery of Therapeutic Agents] <Honda>

Original Ameblo publication: 2023-07-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12812811737.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10010 [CNS Delivery of Therapeutic Agents] <Honda>

The wording of Claim 1 makes clear that the pharmaceutical composition of Invention 1 "comprises phosphate." It is clear that any amount of phosphate, however small, satisfies the invention-defining feature relating to phosphate in Invention 1, provided it is no more than 50 mM ...

⇒ Clarity requirement satisfied

In light of common general technical knowledge, it is necessary to find not only that the priority specification substantially disclosed the ... composition, but also that the delivery effect of the ... composition was substantially disclosed as an effect in the case of ICV administration.

⇒ Priority claim rejected (but inventive step upheld)

The disclosure of a "formulation invention" in the secondary reference was questioned; even assuming such disclosure, obviousness was rejected: "It is questionable whether Ko 6 describes the ... formulation sufficiently to identify a cited invention as an invention of a formulation in the first place; even assuming that it does ... it was not easily conceivable ..."

[Claim 1] ... A pharmaceutical composition characterized in that it is administered intracerebroventricularly to a subject suffering from, or susceptible to, a lysosomal storage disease involving a reduced level or activity of a lysosomal enzyme, wherein the composition comprises the replacement enzyme at a concentration of 5 mg/ml–100 mg/ml and up to 50 mM phosphate, and further characterized in that the composition has a pH of 5.5–7.0.

(Extract from the court's reasoning)

... The wording of Claim 1 of the patent makes clear that the pharmaceutical composition of Invention 1 "comprises phosphate." It is clear that any amount of phosphate, however small, satisfies the invention-defining feature relating to phosphate in Invention 1, provided it is no more than 50 mM. It is therefore evident that the failure to specify a lower limit for phosphate causes no unforeseen harm to third parties.

... In light of common general technical knowledge, for Invention 1 to be recognized as an invention disclosed in Ko 17, it is necessary to find not only that Ko 17 substantially disclosed the composition of Invention 1, but also that it substantially disclosed the delivery effect of that composition as an effect in the case of ICV administration. ... Although Ko 17 can be said to describe ICV and IT administration as alternative administration routes, it contains no description clarifying that delivery can occur similarly through either route, or the like. ... It therefore does not describe the delivery effect of the composition of Invention 1 in the case of ICV administration ... and the application cannot claim priority based on Priority Application 2.

... It is difficult to find immediately that Ko 6 specifically describes delivery or therapeutic effects when the ... formulation is administered; nor is there any description clarifying that the therapeutic effects of IT and ICV administration can be equated. ... It is questionable whether Ko 6 describes the ... formulation sufficiently to identify a cited invention as an invention of a formulation in the first place. Even assuming that it does, there are insufficient circumstances to find that a person skilled in the art could readily have arrived at the configuration of Invention 1 by applying the ... formulation for IT administration to the Ko 2′ invention concerning ICV administration. ...

[Article] Analysis of Recent Reversals in Actions to Revoke JPO Trial Decisions (IP Management, Vol. 73, No. 7, 2023)

Original Ameblo publication: 2023-07-23

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12813218328.html

[Article] Analysis of Recent Reversals in Actions to Revoke JPO Trial Decisions (IP Management, Vol. 73, No. 7, 2023)

<Rates of judgments revoking JPO decisions, 2018–2020>

Decisions on appeals against refusal: 22% (19/85)

Opposition decisions: 72% (18/25)

Decisions finding invalidity: approximately 22% (35/161)

Decisions rejecting invalidity: 26% (79/305)

<Author’s observation> Some actions to revoke decisions on appeals against refusal result from a choice to maintain broad claims without amendment and contest the refusal.

⇒ The main pattern is a challenge for broad coverage after securing the principal claims in a divisional application. (Note: Slightly off topic, the Lipase Supreme Court case likewise involved challenging claims without the qualifier "Ra" after already securing rights to Ra lipase.)

In oppositions, the revocation rate is low, and even after a revocation decision there are many reversals finding validity.

⇒ Possible reasons for the low revocation rate include that patentees can have interviews, that there is no accused product and thus no reluctance to seek correction to preserve the patent, and that decisions maintaining patents are not reviewed by courts.

Intellectual Property High Court, 2020 (Gyo-Ke) 10143 [Vinylidene Chloride Resin Wrapping Film] <Otaka>

Original Ameblo publication: 2023-07-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12813478705.html

Intellectual Property High Court, 2020 (Gyo-Ke) 10143 [Vinylidene Chloride Resin Wrapping Film] <Otaka>

* The specification identifies a particular measuring instrument and states "in accordance with JIS"

⇒ It is natural to understand this as stating that measurements followed the instrument's instruction manual, and that matters not covered in the manual followed JIS.

⇒ Enablement requirement satisfied

* Even without working examples reaching both ends of a numerical range, general descriptions in the specification can satisfy the support requirement!!

Tear strength (cN)

Invention at issue: 2–6

Working examples: 2.4–3.0

Tensile modulus (MPa)

Invention at issue: 250–600

Note: The patentee also won the infringement action

[Claim 1] (Elements A, B, and D specify the “physical-property values”; E–G specify what the judgment calls “composition values,” including film thickness; and C and H identify the product. ⇒ Cited Invention 1-2 (Otsu 12) is a vinylidene chloride resin wrapping film that meets the requirements of E–G, but whether it meets the physical-property values in A, B, and D is unknown.)

A Having a tear strength of 2–6 cN in the TD direction (width direction of the wrapping film), and

B a tensile modulus of 250–600 MPa in the MD direction (machine direction of the wrapping film),

C a vinylidene chloride resin wrapping film,

D having a low-temperature crystallization onset temperature of 40–60°C measured by a temperature-modulated differential scanning calorimeter,

E comprising, relative to a polyvinylidene chloride resin containing 72–93% vinylidene chloride repeating units,

F 0.5–3% by weight of epoxidized vegetable oil and 3–8% by weight of at least one compound selected from the group consisting of citrate esters and dibasic acid esters, and

G having a thickness of 6–18 μm,

H a vinylidene chloride resin wrapping film.

(Extract from the court's reasoning)

... From paragraph [0038] of the specification, it can be understood that the TD-direction tear strength of the "wrapping film of this embodiment" (the invention at issue) was set at "2–6 cN" because, if it is "2 cN or more," it can "reduce tearing, particularly when drawing wrapping film from the roll, and suppress unintended tearing problems during use of the wrapping film," while, if it is "6 cN or less," it is "easy to tear when cutting the film in the TD direction with the serrated blade attached to the dispensing box,

improving cuttability." The specification also shows that Working Examples 1–6, with TD-direction tear strengths of "2.4 cN" to "3.0 cN," were rated "◎" or "○" for "suppression of tearing problems" and all rated "◎" for "cuttability." This confirms the invention's effect of "reducing tearing problems when drawing film from the roll and when picking out the film end that has wound back into the dispensing box, while maintaining the vinylidene chloride resin wrapping film's cuttability with the film-cutting blade." Although the specification provides no working examples in the range "above 3 cN up to 6 cN," paragraph [0038] indicates that increasing "TD-direction tear strength" to "2 cN or more" suppresses tearing problems. It can thus be understood that film in the range "above 3 cN up to 6 cN" also reduces tearing problems. As for "cuttability," paragraph [0009] states: "Although it is possible to increase the film's tear strength by methods such as making the film thicker to suppress tearing problems, this made the film difficult to cut and less convenient to use." In light of this, the object can be understood not so much as improving cuttability with the cutting blade itself, but as "maintaining cuttability" without reducing it through methods such as thickening the film to increase tear strength. Paragraph [0038] further indicates that, at "6 cN or less," the film is "easy to tear when cutting it in the TD direction with the serrated blade attached to the dispensing box, improving cuttability." Accordingly, film in the range "above 3 cN up to 6 cN" can also be understood to maintain cuttability. ...

From paragraph [0039] of the specification, it can be understood that the "MD-direction tensile modulus" of the "wrapping film of this embodiment" (the invention at issue) was set at "250–600 MPa" because, at "250 MPa or more," it "suppresses elongation of the film in the MD direction when force is applied to cut it with the serrated blade, allowing the blade to bite into the film more readily and improving cuttability," while, at "600 MPa or less," the "film is soft, allowing clean cutting along the shape of the serrated blade and suppressing the formation of numerous tears on the cut edge." The specification shows that Working Examples 1–6, with MD-direction tensile moduli of "510 MPa" to "540 MPa," were rated "◎" or "○" for "suppression of tearing problems" and all rated "◎" for "cuttability." This confirms the invention's effect of "reducing tearing problems when drawing film from the roll and when picking out the film end that has wound back into the dispensing box, while maintaining the vinylidene chloride resin wrapping film's cuttability with the film-cutting blade." Although the specification gives no working examples in the range "250 MPa to 500 MPa," there is no evidence suggesting that paragraph [0039] is unreasonable. That paragraph therefore allows one to understand that film within that range also produces the invention's stated effects. Accordingly, a person skilled in the art can recognize from the detailed description that the invention's stated effects are achieved throughout the entire numerical range of "250–600 MPa" for its "tensile modulus," and can recognize that the invention's problem—providing a vinylidene chloride resin wrapping film with those effects—can be solved. ...

Working Examples 1–6 in the specification all concern the specific "distribution and storage" condition of being "stored for one month in a constant-temperature chamber set at 28°C." ... However, ... the specification enables understanding of the meaning of the invention's "low-temperature crystallization onset temperature" and of the mechanism by which controlling it within "40–60°C" suppresses "tearing problems when drawing film from the roll and when picking out the film end that has wound back into the dispensing box." ...

... The plaintiff argues that, although the specification states ... that "tear strength" was measured using a light-load tear tester (manufactured by Toyo Seiki), in accordance with JIS-P-8116, ... the method using that tester ... and the method specified in JIS-P-8116 ... differ in measuring equipment, number of test pieces (and consequently their thickness), and tear length. Thus ... the equipment and the JIS standard to be followed do not correspond, and the method of measuring the invention's "tear strength" is not uniquely determined ... so the enablement requirement is not satisfied. ...

Considering this argument, the specification states regarding tear-strength measurement: "To simulate distribution after shipment and storage in the home, the manufactured wrapping film was stored for one month in a constant-temperature chamber set at 28°C before measurement. Measurements were made with

a light-load tear tester (manufactured by Toyo Seiki), and evaluation was performed in an atmosphere of 23°C and 50% RH. The tear strength of the wrapping film was measured in accordance with the method described in JIS-P-8116." ... A person skilled in the art would have no particular difficulty preparing test pieces of vinylidene chloride resin wrapping film, operating the device (the "light-load tear tester"), and measuring the pieces' "tear strength" based on the sections headed "Intended Use of the Equipment," "Specifications" (test piece dimensions, measurement range, number of test pieces, etc.), "Test Piece Preparation," and "Measurement Principle" in Toyo Seiki's instruction manual ... entitled "Model D, Product Name: Light-Load Tear Tester," issued before the application. ... In context, the statements that "measurements were made with a light-load tear tester (manufactured by Toyo Seiki)" and "measured ... in accordance with the method described in JIS-P-8116" are naturally understood to mean that the invention's "tear strength" was measured according to the instruction manual of the light-load tear tester actually used, and that matters not covered by that manual (for example, the definition of "tear strength" or "expression of test results") followed JIS-P-8116. Therefore, differences between the tear-strength measurement method in JIS-P-8116 and the method using the light-load tear tester do not mean that the method for measuring the invention's "tear strength" is not uniquely determined.

Intellectual Property High Court, 2022 (Gyo-Ke) 10012 [Touch-Operated Input Device] <Kanno>

Original Ameblo publication: 2023-07-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12813742811.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10012 [Touch-Operated Input Device] <Kanno>

* Combining even well-known technology requires motivation and the like

⇒ The court criticized combining the primary reference and well-known technology after generalizing their respective technical fields.

Note: The patentee previously prevailed at first instance in an infringement action against the plaintiff Apple on the same patent (336,641,920 yen awarded). 2007 (Wa) Nos. 2525 and 6312

(Extract from the court's reasoning)

... Ground for Revocation 1-1 (error in assessing inventive step of Patented Invention 1 with the Ko 1 invention as the primary reference) ...

Even if Well-Known Technology 1 is understood at a generalized level as a technology that generates some input information by confirming a touch-panel selection with a push switch, the Ko 1 invention lacks the function to be assigned to the push switch (confirming a selection) in the first place. Although Ko 1 describes continuous control of magnetic tape travel direction and speed using a touch panel, it neither describes nor suggests an operation confirming the travel direction or speed selected with the touch panel, or a button or other configuration corresponding to that operation. There is therefore no motivation to apply Well-Known Technology 1 to the Ko 1 invention. ...

... Ground for Revocation 2-1 (error in assessing inventive step of Patented Invention 1 with the Ko 2 invention as the primary reference) ...

The Ko 2 invention addresses the fact that conventional jog dials increase the number of parts and have limits on thickness reduction, hindering thinner operation panels. It therefore aims to provide a jog-dial-like switch that, with a simple configuration, allows a thinner operation panel and improved operability. ... Applying the push button of Well-Known Technology 1 would increase the number of parts and run counter to the demand for reduced thickness; there is thus a teaching-away factor. ...

... Ground for Revocation 3-1 (error in assessing inventive step of Patented Invention 1 with the Ko 3 invention as the primary reference) ...

Deliberately dividing among multiple components a composite function already achieved by a single key would also contradict the Ko 3 invention's problem and effects ... of "reducing switch thickness and cost."

Intellectual Property High Court, 2022 (Gyo-Ke) 10007 [Heat Transport System] <Shoji> Specific problems need not be common unless the problems to be solved differ greatly

Original Ameblo publication: 2023-07-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12813872860.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10007 [Heat Transport System] <Shoji>

* When selecting a primary reference, the specific problems need not be common unless the problems to be solved differ greatly

"At the stage of selecting a primary reference, unless the problems to be solved by the claimed invention and the primary cited invention differ greatly in the first place, their specific problems need not be common ..."

⇒ In Europe, the closest prior art is an important issue!!

(Extract from the court's reasoning)

At the stage of selecting a primary reference, unless the problems to be solved by the claimed invention and the primary cited invention differ greatly in the first place, their specific problems need not be common. ... In this case, the ... problem of the claimed invention ... is not particularly new, but is, so to speak, a self-evident problem. It can be said to have been solved in the cited invention, which adopts carbon dioxide as the heat transport medium.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91747.pdf

Intellectual Property High Court, 2022 (Gyo-Ke) 10007 [Heat Transport System] <Shoji>

Original Ameblo publication: 2023-07-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12814140381.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10007 [Heat Transport System] <Shoji>

* When selecting a primary reference, the specific problems need not be common "unless the problems to be solved by the claimed invention and the primary cited invention differ greatly"

⇒ ... If the problems to be solved differ greatly, would suitability as a primary reference be denied even in Japan!?

⇒ In Europe, the closest prior art is an important issue!!

Note: Intellectual Property High Court, 2010 (Gyo-Ke) 10237, Water Treatment Apparatus <Takizawa>: The Hanrei Times commentary explains that it is necessary to demonstrate that selecting the cited reference was easy. The judgment, however, treats the issue as an error in identifying common features and differences: the cited invention concerns "hydrothermal reaction treatment" and is not within the category of "water treatment" of the invention at issue. This is not necessarily the same as the Hanrei Times explanation.

(Extract from the court's reasoning)

At the stage of selecting a primary reference, unless the problems to be solved by the claimed invention and the primary cited invention differ greatly in the first place, their specific problems need not be common. ... In this case, the ... problem of the claimed invention ... is not particularly new, but is, so to speak, a self-evident problem. It can be said to have been solved in the cited invention, which adopts carbon dioxide as the heat transport medium.

Tokyo District Court, 2018 (Wa) 1130 [Printed Retroreflective Sheet]

Original Ameblo publication: 2023-08-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12814697441.html

Tokyo District Court, 2018 (Wa) 1130 [Printed Retroreflective Sheet] <Damages> Rebuttal of the Article 102(2) presumption: 20% rebutted

The plaintiff's lower-priced product rebuts the presumption, but because its sales volume might be greater, substantial rebuttal is inappropriate.

It is inappropriate to regard products as competing products while disregarding their prices, performance, and other features.

<Grounds for rebutting the presumption>

The defendants' argument, which posits a technical feature by focusing on only part of the invention, lacks a proper premise.

The appropriateness of the conditions and environment of weather-resistance tests on the defendants' old and new products is not necessarily clear, so the results do not establish an absence of substantial differences.

Catalogues and websites for the defendants' old products contain numerous statements emphasizing superior water resistance, weather resistance, and hue performance—the invention's technical features.

Even if the defendants possess the brand strength of the 3M group, there is no evidence establishing the extent of its contribution to sales of their old products.

Even if sales did not change substantially before and after switching from the defendants' old products to their new products, it is uncertain whether customers recognized the differences. The possibility that the old products' previous customer-attracting power influenced subsequent sales of the new products cannot therefore be ruled out.

To qualify as a competing product, a product must compete with the infringing product in the market. It is inappropriate to treat retroreflective sheets as competing products merely because they serve similar uses, disregarding their prices, performance, and other features.

The plaintiff's lower unit selling price rebuts the presumption, but because its sales volume might exceed the defendants' sales volume, substantial rebuttal is inappropriate.

(Extract from the court's reasoning <Rebuttal circumstances>)

Considering the points asserted by the defendants as grounds for rebutting the presumption under the proviso to Patent Act Article 102(1), it is appropriate to allow a 20% rebuttal, as follows.

(a) The defendants argue that the limitation on the area of the printed regions in the print layer, identified as a feature distinguishing the invention from prior inventions, contributes nothing to attracting customers; that the weather resistance of their old and new products does not substantially differ; that even in the catalogue for their old products the size of the print-layer area is not presented as a selling point; and that the plaintiff does not sell products embodying the invention in Japan. They therefore argue that the invention cannot be said to contribute to sales of their old products.

However, as explained in 1(9) above, the invention's technical feature distinguishing it from the prior art lies in combining the following configurations in the print layer of a retroreflective sheet: "the printed regions form independent regions arranged in a repeating pattern without forming a continuous layer," "the

area of each independently printed region is 0.15–30 mm²," and "containing a white organic pigment ... colorant." This combination improves adhesion around the print layer, improves water and weather resistance, and improves hue. The defendants' argument that isolates only part of that combination to posit the technical feature therefore lacks a proper premise. As for the weather-resistance test results for the defendants' old and new products (Otsu 45–49), the appropriateness of the test conditions and environment is not necessarily clear, and those results cannot immediately establish an absence of substantial differences in weather resistance. Moreover, the evidence (Ko 3, 4, 9, 10, 23, 67–70) and the entire purport of oral argument establish that catalogues and websites for the defendants' old products contain numerous statements emphasizing superior water resistance, weather resistance, and hue performance, which are the invention's technical features.

It is therefore inappropriate to recognize the defendants' above arguments as grounds for rebutting the presumption.

(b) Next, the defendant argues that the invention does not contribute to sales of the old products to customers; rather, the defendants' credibility, track record, and name recognition backed by the 3M brand make an extremely large contribution. It points out that sales in fact did not change substantially before and after the switch from the old products to the new products.

However, even assuming that the defendants possess the brand strength of the 3M group, no adequate evidence has been submitted establishing how much it contributed to sales of the old products. Even if sales did not change substantially before and after the switch, it is uncertain whether customers recognized the differences between the old and new products. The possibility that the old products' previous customer-attracting power influenced subsequent sales of the new products cannot be ruled out, and this does not immediately establish that the invention made no contribution to sales to customers.

It is therefore inappropriate to recognize the defendants' above arguments as grounds for rebutting the presumption.

(c) The defendants also argue that, for long-roll products including their products used for road signs on major national roads and expressways, they have an extremely large sales share as pioneers in retroreflective sheets, and the plaintiff lacks the capacity to work the invention for the quantity of the defendants' old products sold. They argue that the sales ratios of their products and their other products (Diamond-grade and Engineering-grade retroreflective sheets) are respectively ●(omitted)●, while the plaintiff's products have a 10% ratio; thus, if Defendant Product (1) could no longer be sold, only ●(omitted)● (= 10 / (10 + ●(omitted)●)) of that demand would shift to the plaintiff's products.

However, to qualify as a competing product in the first place, a product must compete with the infringing product in the market. The defendants assume that their Diamond-grade and Engineering-grade retroreflective sheets are competing products. The entire purport of oral argument suggests, however, that the former costs at least ●(omitted)● of the price of their old products, and that the latter does not have performance equivalent to their old products. It is inappropriate to disregard these products' prices, performance, and other features and treat them as competitors simply because they are retroreflective sheets serving similar uses. Accordingly, the Diamond-grade and Engineering-grade retroreflective sheets asserted by the defendants cannot be recognized as competing with their old products in the market. Demand for the old products therefore cannot be said to be allocated in proportion to the sales shares of those Diamond-grade and Engineering-grade sheets and the plaintiff's products.

It is therefore inappropriate to recognize the defendants' above arguments as grounds for rebutting the presumption.

(d) Furthermore, the defendants argue that, even if all demand for the old products shifted to the plaintiff's products, the plaintiff's lost profits would be limited to the quantity of old products sold multiplied by the plaintiff's marginal profit rate. The plaintiff's unit selling price is in a range of approximately ●(omitted)●

of that of the old products, while deductible costs, including production costs, should likewise be approximately ●(omitted)●, as for the old products. They argue that the plaintiff's marginal profit rate can therefore be inferred to be only approximately ●(omitted)● of that of the defendants' products, and that damages presumed under Patent Act Article 102(2) would substantially exceed the plaintiff's lost profits.

On this point, the entire purport of oral argument establishes that the plaintiff's unit selling price is in a range of approximately ●(omitted)● of that of the defendants' old products. Even if the old products had not been sold, it is difficult to find that the plaintiff could have earned marginal profits equal to those of the old products. It is therefore appropriate to allow rebuttal of the presumption to a certain extent on this ground. On the other hand, the low unit selling price of the plaintiff's products might have resulted in a sales volume exceeding that of the defendants' products. Accordingly, substantial rebuttal of the presumption cannot be considered appropriate either.

(e) Considering all these circumstances comprehensively, among the grounds asserted by the defendants, only the difference between the unit selling prices of the plaintiff's products and the defendants' old products should be considered as a ground for rebuttal. A rebuttal rate of 20% is appropriate.

Osaka District Court, 2016 (Wa) 4815 [Oil-Cooled Screw Compressor] Rebuttal of the Article 102(2) presumption: 90% rebutted

Original Ameblo publication: 2023-08-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12814830804.html

Osaka District Court, 2016 (Wa) 4815 [Oil-Cooled Screw Compressor]

<Damages> Rebuttal of the Article 102(2) presumption: 90% rebutted

Approximately 1.38 billion yen awarded

The plaintiff's advertisements neither directly describe nor suggest the effects of the invention.

The plaintiff itself does not work the invention either.

The plaintiff's and defendant's business models differ substantially.

<Grounds for rebutting the presumption>

Advertisements prepared by the plaintiff for its products contain neither direct descriptions nor specific statements suggesting the effects of the invention. The plaintiff itself does not work the invention either.

The substantial difference between the plaintiff's and defendant's business models suggests that demand for the infringing NewTon system and demand for the plaintiff's products have qualitatively different aspects.

⇒ It is unreasonable to assume that, absent sales of the defendant's plants incorporating its products, all demand would have shifted to the plaintiff's products, screw compressors incorporating them, or plants using them. Rather, such demand would be very limited. (★ The 90% rebuttal relates to the high monetary value. High sales suggest added value apart from the patent.)

⇒ Reversed on appeal (inventive step rejected)

In the appellate judgment of May 19, 2021, IP High Court, 2020 (Ne) No. 10019, the invention was found to lack inventive step; the portion adverse to the defendant was reversed ⇒ the claim was dismissed on the merits.

(Extract from the court's reasoning)

"C. Rebuttal of the presumption

(A) Underlying circumstances

a. The NewTon system, Defendant Products 2-2 and 2-3, and related matters

(a) Features of the NewTon system and promotional activities

The NewTon system was commercialized as NewTon3000 in 2007 and has been sold for use in the defendant's plants since 2008 (Ko 8-3, Otsu 45). It is essentially not sold separately and independently from freezing and refrigeration plants. Not only Defendant Products 2-2 and 2-3 but all Defendant Products 2 are compressors dedicated to the NewTon system (Ko 3), necessarily purchased when buying a defendant-manufactured plant using that system. Like the NewTon system itself, these are essentially not sold separately and independently. NewTon3000 was also said to achieve 20% energy savings over conventional models through such measures as an IPM motor. Initial sales targets were 200 units per year at launch and 800 units per year after ten years (Otsu 45, 116).

The defendant continued development of the NewTon system. In 2012 it expanded the series to include NewTonC exclusively for chilled applications, NewTonF exclusively for freezers, and other models, selling

a cumulative total exceeding ●(omitted)● units by 2016. In July 2016 it also began selling F-300, F-600, and other freezer-only models that maintained energy efficiency while reducing refrigerant charge, improving maintainability, and reducing size and weight (Ko 8-3, Otsu 45).

The NewTon system was described as featuring greater economy and energy efficiency through such measures as an IPM motor developed by the defendant itself; an indirect cooling method using the natural refrigerant ammonia to cool carbon dioxide as a response to fluorocarbon refrigerants scheduled for complete phaseout in 2020, with safe ammonia use enabled by confining it to the machine room and rapid response to leaks enabled by leak sensors and other equipment; a compact unit design facilitating installation; and a 24-hour, 365-day support system including remote monitoring and maintenance diagnostic systems. Promotional activities emphasized these points (Ko 8-3, Otsu 38, 45).

Advertisements for the NewTon system and Defendant Products 2-2 and 2-3 contain no direct reference to, or specific indication of, the invention's effects as described in the specification (Ko 3, 8-3, Otsu 38, 66-1).

(b) Assessments by businesses that installed the NewTon system

In articles it produced entitled "Customer's Point of View," the defendant introduces customers' reasons for installing the NewTon system and the results after installation. They include the following statements.

• In addition to eliminating fluorocarbons, the customer particularly valued energy efficiency and system completeness, with improvements in operational management also decisive in adopting the NewTon system. The results included eliminating fluorocarbon use, an average 15–18% reduction in electricity consumption, and a safer, less labor-intensive operational management system through a maintenance contract (Otsu 67).

• The customer adopted the NewTon system because it could support highly efficient production without fluorocarbons and because it valued the defendant's comprehensive construction and maintenance capabilities. This enabled an efficiency-focused production line, increased production capacity, and enhanced environmental and energy-saving measures. The packaged approach also shortened construction time, while fully automated operation provided a safe, less labor-intensive operational management system (Otsu 68).

• The customer adopted the NewTon system because of its energy efficiency, cooling speed, and continuous operating time compared with conventional equipment. It achieved approximately 40% lower annual electricity consumption, stable production of high-quality frozen bread dough, reduced environmental burden by addressing the complete phaseout of fluorocarbons, and less maintenance effort through fully automated operation.

This customer reportedly received proposals from several companies and investigated and considered them thoroughly when renewing its equipment (Otsu 69).

• The customer adopted the NewTon system because of its energy efficiency and safety compared with direct ammonia cooling. Compared with facilities of the same scale, it achieved an average reduction of approximately 38% in electricity consumption, lower carbon dioxide emissions, reduced construction work and time, and improved safety (reduced risk of ammonia leaks, remote monitoring, etc.) (Otsu 70).

(c) The Ministry of the Environment's website contains a "Collection of Interviews with Company Representatives Introducing Energy-Saving Natural-Refrigerant Equipment," with articles on customers apparently using the NewTon system. These include the following statements.

• As part of advancing one of the company's key themes, its "plan to eliminate all fluorocarbon refrigeration machines," it is replacing refrigeration equipment with equipment using natural refrigerants (Otsu 60).

• The customer installed the high-efficiency natural-refrigerant refrigeration machine "NewTon" in a refrigerated warehouse. It chose a natural-refrigerant machine because subsidies could reduce initial installation costs and it expected energy savings to reduce electricity bills. It received proposals from several companies on the premise of natural-refrigerant refrigeration, and selected the defendant's proposal as a model that could be installed at an economically viable level using the subsidy. Although some aspects of the energy-saving effect remained unclear because little time had passed since installation, a substantial reduction in peak electricity demand was one benefit (Otsu 61).

• Energy-saving natural-refrigerant equipment was installed to comply with fluorocarbon regulations. In addition to avoiding risks by selecting a natural refrigerant, the customer considers reduced electricity bills a major benefit. Installation costs are approximately 10–15% higher than for the previous equipment, but the customer considers that difference unavoidable in view of global warming (Otsu 62).

• Among the benefits of installing energy-saving natural-refrigerant equipment, average electricity consumption was reduced by 15–20%. However, company-wide policy prioritizes eliminating fluorocarbons over energy savings, and a certain degree of reduction has also been achieved in that respect (Otsu 63).

(d) Presentation materials entitled "Initiatives to Introduce Natural-Refrigerant Equipment" at a Japan Association of Refrigerated Warehouses seminar state that installation of ten refrigeration machines in total, covering two NewTon-series models, together with other equipment, achieved approximately 50% lower electricity consumption and a reduction of 2,073 tonnes of carbon dioxide emissions annually (Otsu 118).

(e) In the articles and other materials described in (b)–(d), none of the customers directly mentions the invention's effects either as a reason for adopting the NewTon system or as a result of doing so, and there are no specific statements suggesting its contribution.

(f) Awards received by the defendant in connection with the NewTon system

• The defendant received the Minister of the Environment's FY 2008 Commendation for Global Warming Prevention Activities for its efforts to eliminate fluorocarbons by using ammonia and carbon dioxide as refrigerants and for developing highly efficient, energy-saving refrigeration equipment (Otsu 64).

• The large refrigeration machine "NewTon3000" received the Nikkei Superior Products and Services Award 2008 for adopting a refrigeration system using natural refrigerants such as ammonia and carbon dioxide without any alternative fluorocarbons, and for reducing electricity consumption by approximately 30% compared with conventional models through permanent magnets in its independently developed motor (Otsu 65).

• The MAYEKAWA Freezer Pack, combining the high-efficiency natural-refrigerant NewTon F refrigeration system with various freezer models, received the FY 2015 "Nisshoku Excellent Food Machinery, Materials and Ingredients Award," which recognizes products supporting development of the food industry through cost reduction and other benefits (Otsu 66).

None of the stated reasons for these awards directly mentions or specifically suggests the invention's effects (Otsu 64–66).

(g) Articles concerning the NewTon system

An interview report entitled "Co-Creating Innovation: Co-Creation with Customers and with Sales" (Marketing Journal, Vol. 35, No. 4 (2016); Otsu 45) features the defendant's NewTon system. It identifies such features as outstanding energy-saving performance, environmental responsiveness, shorter construction periods through standardized production, high reliability and safety, and services providing "predictive maintenance" through a 24-hour remote monitoring network. It also states that continual

performance improvements and other measures maintain the product's competitive advantage. Although operating costs are 20–40% lower, the product price is three to four times that of competitors' products using alternative fluorocarbons. As the reason for growing adoption despite this, the report cites a business model that packages the manufactured product with other refrigerated-warehouse equipment and handles everything through construction and maintenance. This absorbs some of the product price difference within plant orders and reduces total costs while providing customers with reassurance and confidence.

The report, however, contains no direct reference to, or specific statement suggesting, the invention's effects.

(h) Manufacturing cost ratio

The evidence (Ko 6) and the entire purport of oral argument establish that, within the NewTon systems incorporating Defendant Products 2-2 and 2-3, not only the portions alleged by the defendant to be infringing (compressor body, oil separator, and piping) but also the oil cooler, filter, drive motor, and controller are necessary components of an oil-cooled screw compressor. Conversely, the evidence (Otsu 109) and the entire purport of oral argument establish that the oil-return component in those systems is not a necessary component of an oil-cooled screw compressor.

The evidence (Otsu 75, 84, 109, 110) and the entire purport of oral argument establish that the manufacturing costs of the components necessary for the oil-cooled screw compressor account for ●(omitted)●% of the NewTon system's manufacturing costs.

b. The plaintiff's products

(a) Features of the plaintiff's products

Among the plaintiff's products, those called compressor units correspond to screw compressors, and those called condensing units correspond to screw compressors equipped with condensers (Ko 13). The entire purport of oral argument establishes that none of the plaintiff's products works the invention.

Among those products, the SHN series improves reliability against gas and oil leaks and is advertised as environmentally friendly refrigeration equipment that does not deplete the ozone layer and has a low global-warming potential (Ko 13).

An article entitled "Two-Stage Semi-Hermetic Ammonia Refrigeration Machine" (Kobe Steel Engineering Reports, Vol. 63, No. 2 (Sept. 2013); Ko 13-5) describes the iZ series as refrigeration equipment featuring superior energy efficiency, greater refrigerating capacity, and quiet operation. Improved energy efficiency contributes to reducing customers' operating costs and carbon dioxide emissions; greater refrigerating capacity reduces initial costs and improves the quality of the objects being cooled. The semi-hermetic ammonia refrigeration machines are also said to fit the trends toward preventing global warming and environmental conservation, with cumulative shipments exceeding 200 units as of September 2013. Advertising emphasized high energy efficiency, elimination of concern over ammonia leakage and improved maintainability through semi-hermetic construction, increased refrigerating capacity compared with conventional machines, and emergency-response capability through constant monitoring of operating conditions (Ko 13).

The plaintiff's advertisements for its products, however, contain no direct description of, or specific statement suggesting, the invention's effects (Ko 13).

(b) Promotional activities by distributors of the plaintiff's products

A business claiming to "provide comprehensive factory energy-saving solutions" through "compressor sales and system proposals" introduces the plaintiff's iZ series among its offerings. Alongside the achievement of receiving the "FY 2003 Japan Machinery Federation Chairman's Award," it emphasizes a 40% improvement in refrigerating capacity over conventional machines, emergency-response capability through constant monitoring of operating conditions, and energy-saving performance (Ko 15-2).

(c) Awards received by the plaintiff's products

Among the plaintiff's products, the iZ series received the FY 2003 Japan Machinery Federation Chairman's Award for outstanding energy-saving equipment (Ko 15-2), and in 2004 received a technology award from the Japan Refrigeration and Air Conditioning Industry Association (Ko 15).

c. Sales records of the NewTon system and the plaintiff's products

The evidence (Ko 13-4, Otsu 73) and the entire purport of oral argument establish that the market for oil-cooled screw compressors used in refrigeration machines for ammonia/carbon dioxide refrigerant refrigeration facilities is effectively a duopoly of the plaintiff and defendant, and that sales trends from 2008 to 2016 for the defendant's NewTon systems incorporating Defendant Products 2-2 and 2-3 and for the plaintiff's products are as shown in the following graph.

●(omitted)●

Meanwhile, the evidence (Ko 18, 19, Otsu 73, 85, 93, 110) and the entire purport of oral argument establish that, during the same period, the defendant's sales of NewTon systems incorporating Defendant Product 2-1 totaled no more than ●(omitted)●.

(B) Analysis

a. As found above, the defendant essentially does not sell Defendant Products 2-2 and 2-3, which are oil-cooled screw compressors, independently. The same is true of the NewTon systems incorporating them: the defendant sells plants using those NewTon systems. By contrast, the plaintiff merely sells its products consisting of screw compressors or screw compressors with added condensers. At the plant level, those products are sold as components of packages proposed to customers by other businesses, sometimes called "set manufacturers." This substantial difference in business models suggests that demand for the infringing NewTon system and demand for the plaintiff's products have qualitatively different aspects. Accordingly, even if NewTon systems incorporating Defendant Products 2-2 to 2-3 had not been sold, it is difficult to envisage any of the plaintiff's products directly substituting for Defendant Product 2-2 or 2-3. On the other hand, all or part of the demand corresponding to the quantity of Defendant Products 2-2 and 2-3 transferred might in that case have shifted to plants using systems incorporating the plaintiff's products. In that event, demand would ultimately have shifted to the plaintiff's products. However, the plaintiff merely sells compressors constituting part of a plant, and its influence over the overall configuration and price of the plant and over promotional activities directed at customers appears limited.

The existence and extent of rebuttal of the presumption are considered below with these perspectives also in mind.

b. Since Defendant Products 2-2 and 2-3 fall within the technical scope of the invention, they can generally be expected to produce its effects, and no circumstances suggest that they fail to do so. The defendant argues that those products do not produce the invention's effects, but that argument cannot be accepted.

Nevertheless, the invention's effects consist of reducing vibration and noise with a simple, compact structure by, among other things, increasing the thrust bearing's load capacity, increasing the balance piston's pressure-receiving area, and eliminating reverse-thrust load conditions. Whatever their technical significance, these effects are not necessarily of a nature to have a strong impact on the economic value of products embodying the invention or systems incorporating them. This is supported by the defendant's failure to refer directly to those effects in promotional activities for Defendant Products 2-2 and 2-3; the absence of external evaluations of the NewTon system directly related to, or suggesting, those effects; and the fact that even the plaintiff patentee does not work the invention in its own screw compressors and other products. Accordingly, the invention's effects themselves should be regarded as having relatively weak customer-attracting power.

The entire purport of oral argument also establishes that the NewTon system forms the core of the customer-attracting power of the defendant's plants and that Defendant Products 2-2 and 2-3 are indispensable components for operating the system. Considering the NewTon system's customer-attracting power, the defendant's promotional activities emphasize energy savings, safety, support arrangements, and other features. These features are also positively evaluated by third parties: they have been cited as reasons for awards, motivated adoption, and reportedly produced actual results. (The plaintiff argues that energy savings and safety are also effects of the invention. However, the NewTon system's energy savings and safety appear attributable to measures such as adoption of an IPM motor and indirect cooling, unrelated to the invention's effects. The plaintiff's argument on this point cannot be accepted.)

c. The proportion of the NewTon system's manufacturing costs attributable to Defendant Products 2-2 and 2-3 does not directly reflect their technical or commercial value, but is one circumstance from which it may be estimated. Although those products are indispensable to operation of the NewTon system, their manufacturing costs account for only ●(omitted)● of the system's manufacturing costs.

d. Because the market for oil-cooled screw compressors used in refrigeration machines for ammonia/carbon dioxide refrigerant refrigeration facilities is effectively a duopoly of the plaintiff and defendant, sales of defendant-manufactured plants using NewTon systems and of other similar plants can be inferred to correspond roughly to deliveries of compressors manufactured by the defendant and plaintiff, respectively. Sales of defendant-manufactured plants using NewTon systems have the upward trend ●(omitted)●. It is also difficult to envisage compressors not manufactured by the defendant (naturally, the plaintiff's products would be the candidates) being incorporated into NewTon systems used in the defendant's plants. Accordingly, if the defendant sold, or could easily sell, noninfringing products, it is reasonable to think that, even without sales of NewTon systems incorporating Defendant Products 2-2 and 2-3, much of the demand would have shifted to plants using NewTon systems incorporating noninfringing products manufactured by the defendant.

In addition to Defendant Products 2-2 and 2-3, the defendant manufactures Defendant Product 2-1 as a NewTon-specific product that does not infringe the invention, and it could substitute for Products 2-2 and 2-3. The plaintiff points out that sales of NewTon systems incorporating Product 2-1 were low. However, because there were actual deliveries, the possibility of demand shifting to substitution with Product 2-1 cannot be excluded so long as it meets customers' needs.

At the time of infringement, the defendant did not manufacture NewTon-specific oil-cooled screw compressors other than Defendant Products 2. Nevertheless, the entire purport of oral argument suggests relatively few physical constraints on, for example, adding an oil pump and providing a pressurized flow path in the NewTon system to avoid infringement, and the associated costs do not appear sufficiently high to be problematic. It therefore appears relatively easy to have responded to customers wanting the defendant's plants by customizing an existing model and thereby avoiding infringement. Although in reality Product 2-1 was the only NewTon-specific noninfringing compressor, and no such customization occurred, it is reasonable to consider this point as a circumstance warranting rebuttal. The plaintiff argues that only products actually present in the market can be considered competing products, but, as stated above, that argument cannot be accepted.

e. On the premise that the defendant's NewTon business has a higher marginal profit rate than the plaintiff's compressor business, the defendant argues that, where profits calculated under Patent Act Article 102(2) exceed the profits the plaintiff patentee could have earned based on its capacity to work the invention, the presumption is rebutted to that extent.

However, even if the defendant's NewTon business has a higher marginal profit rate, that does not mean that the plaintiff's compressor business has less capacity to work the invention than the defendant's NewTon business. The argument therefore lacks a proper premise.

The defendant's argument on this point cannot therefore be accepted.

f. Considering the foregoing circumstances comprehensively, it is unreasonable in this case to assume that, absent sales of defendant-manufactured plants using NewTon systems incorporating Defendant Products 2-2 and 2-3, all corresponding demand would have shifted to the plaintiff's products, screw compressors incorporating them, or plants using them. Rather, such demand is considered very limited. Accordingly, the presumption under Patent Act Article 102(2) should be rebutted to the extent of 90%."

089306_hanrei.pdf (courts.go.jp)

Tokyo District Court, 2019 (Wa) 2675 [Blowgun Darts] <Damages> Rebuttal of the Article 102(2) presumption: 65% rebutted for profits during part of the sales period

Original Ameblo publication: 2023-08-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12815238520.html

Tokyo District Court, 2019 (Wa) 2675 [Blowgun Darts] <Damages> Rebuttal of the Article 102(2) presumption: 65% rebutted for profits during part of the sales period

<Grounds for rebutting the presumption>

Most of the defendant's products were purchased by customers connected with the blowgun association, and a considerable proportion were purchased because they were association-approved equipment.

⇒ Because the plaintiff's blowgun equipment was not association-approved, not all demand for the defendant's products would have shifted to darts manufactured and sold by the plaintiff.

(Extract from the court's reasoning)

It is appropriate to find that most of the defendant's products were purchased by customers connected with the blowgun association. A considerable proportion were purchased by persons connected with the association because the products were association-approved equipment. Since the plaintiff's blowgun equipment was not association-approved from December 1, 2020 onward, not all demand for the defendant's products purchased for that reason would have shifted to darts manufactured and sold by the plaintiff. On the other hand, some people apparently would have bought the plaintiff's darts even without the association's approval, so it cannot be said that none of the demand would have shifted to the plaintiff's blowgun equipment.

The defendant seeks rebuttal of the presumption concerning its sales from December 1, 2020 onward because the plaintiff's equipment was not association-approved. In light of the above circumstances, it is appropriate to find the presumption of damages rebutted by 65% for profits from that date onward.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-90335.pdf

Tokyo District Court, 2017 (Wa) 7207 [Vacuum Cleaning Apparatus] <Damages> Rebuttal of the Article 102(2) presumption: 50% rebutted

Original Ameblo publication: 2023-08-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12815238865.html

Tokyo District Court, 2017 (Wa) 7207 [Vacuum Cleaning Apparatus] <Damages> Rebuttal of the Article 102(2) presumption: 50% rebutted

<Grounds for rebutting the presumption>

The invention concerns the drying process of a vacuum cleaning apparatus. The apparatus's principal purpose is cleaning workpieces. The patent contributes only to part of the defendant's product as a whole.

Customers are particularly interested in whether the desired workpieces can be cleaned. The invention's rapid-drying effect has less influence on attracting customers than cleaning capacity does.

Because both are "non-immersion" types, the plaintiff's product is more substitutable for the defendant's product than competitors' products are.

(Extract from the court's reasoning)

Patent Act Article 102(2) establishes a presumption. If the infringer alleges and proves that some or all of its profits lack an adequate causal relationship with the patentee's damage, the presumption is rebutted to that extent. As considered below, the presumption should be rebutted by 50%; the damage suffered by the plaintiffs from manufacture and sale of the defendant's product itself can therefore be found to be 321,115,130 yen.

A. Patent Right 2 concerns the drying process of a vacuum cleaning apparatus. As also described in paragraphs [0023]–[0031] of the specification and related documents, the apparatus performs a series of operations including preparation, loading, cleaning, drying, and unloading. Although drying also plays an important role, the apparatus's principal purpose is cleaning workpieces. The patent can therefore be said to contribute only to part of the defendant's product as a whole.

Customers purchasing a vacuum cleaning machine are also considered particularly interested in whether it can clean the desired workpieces. The rapid-drying effect of Invention 2 therefore has less influence on attracting customers than cleaning capacity does.

B. The evidence (Ko 36, attachment) establishes that market shares for vacuum cleaning apparatuses in the fiscal year ended March 2015 were: Nachi-Fujikoshi, 52.5%; the plaintiff, 25.0%; Aqua Chemical Co., Ltd., 7.5%; Cleanvy Co., Ltd., 4.5%; and the defendant, 4.5%.

On the other hand, for example, market leader Nachi-Fujikoshi is strong in "immersion" products (washing by immersing products in cleaning liquid within the cleaning chamber), whereas both the plaintiff and defendant also focused on developing and selling "non-immersion" products (washing using vapor, showers, etc.) (Ko 50).

In fact, the defendant's product is a "non-immersion" type that enables rapid drying through a large-capacity L-shaped vacuum valve and a water-cooled baffle. Its product brochure (Ko 37) states, for example, "Rapidly dries products. Drastically shortens conventional drying time from 10 minutes to 1–2 minutes." Compared with competitors' brochures emphasizing cleaning performance and the like (Ko 38–43), it was, like the plaintiff's product (Ko 44), a product that appealed to customers by highlighting rapid drying.

Accordingly, even if some customers would have purchased vacuum cleaning apparatuses from competitors rather than the plaintiff absent infringement of Patent Right 2, the defendant's product's non-immersion type and emphasis on rapid drying mean that the plaintiff's product is more substitutable for it than competitors' products are.

C. The defendant argues that Invention 2 has a low degree of inventive step. (Since this argument concerns damages, the plaintiffs' contention that it is an untimely means of attack or defense and should be rejected is without merit.)

However, to solve the problem that the conventional method of evacuating cleaning and drying chambers with a vacuum pump to reduce pressure requires a long drying process, Invention 2 adopts configurations including "a condensing chamber depressurized by the vacuum pump independently of the cleaning chamber and maintained in that depressurized state" (Element 2D), and

"drying the workpiece by placing the cleaning chamber ... in communication with the condensing chamber" (Element 2G). It achieves rapid drying through condensation caused by communication between the condensing and cleaning chambers. There is insufficient evidence that the invention's technical concept or characteristic configuration was publicly known when Patent 2 was applied for.

Accordingly, in this case it is inappropriate to consider the degree of inventive step of Invention 2 as a circumstance concerning inability to sell the defendant's product.

D. Considering these circumstances comprehensively, the above presumption of damages under Patent Act Article 102(2) should be rebutted to the extent of 50%.

Tokyo District Court, 2016 (Wa) 25436 [Method for Constructing Amino Acid-Producing Bacteria] <Damages>

Original Ameblo publication: 2023-08-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12815239110.html

Tokyo District Court, 2016 (Wa) 25436 [Method for Constructing Amino Acid-Producing Bacteria] <Damages>

<Rebuttal of the Article 102(2) presumption: 50% rebutted>

Competing products (allocation according to market share)

<Grounds for rebutting the presumption>

Sales of competing products (reduction according to market share)

⇒ There is no evidence establishing the volume imported from Indonesia by businesses other than the plaintiff. Nevertheless, at least approximately 50% of the demand for the MSG sold by the defendants may have shifted to monosodium glutamate imported and sold by parties other than the plaintiff.

<Contribution rate> Production of glutamic acid by fermentation includes fermentation and purification stages, with multiple reactions within the strain during fermentation. Even if the invention concerns only a particular stage or reaction, this does not establish that the patented inventions made a low contribution to production of the MSG at issue.

(Extract from the court's reasoning)

Grounds for rebutting the presumption

(A) Sales of competing products (reduction according to market share)

a. The evidence (Otsu 101, 117) and the entire purport of oral argument establish that imports of monosodium glutamate into Japan from each country during the periods in which the defendants' respective processes were used were as stated in columns ①–⑩ of Appendix 16, "Imports of Monosodium Glutamate during the Periods of Use of the Defendants' Respective Processes." Of these, all imports from ① Thailand and ② Brazil were imported by the plaintiff and sold in Japan. Imports from ③ Indonesia included imports by the plaintiff as well as the quantities sold by the defendants (③A). For calculation of the 2017 figures, the quantities in Attachment 7, rather than Attachment 6, to Exhibit Otsu 101 were used as data comparable to the 2011–28 materials (Otsu 117).

b. The MSG at issue is monosodium glutamate. All monosodium glutamate described in a above that was imported during the periods of use of the defendants' respective processes is found to constitute products competing in the Japanese market as equivalents of the MSG sold by the defendants.

The existence of these competing products, in addition to those sold by the defendants and imported and sold by the plaintiff, should be considered a circumstance warranting rebuttal of the presumption under Patent Act Article 102(2) for part of the total marginal profits of the defendants described in E above.

c. The rebuttal rate based on these circumstances is considered below.

Regarding the quantity (③B) of imports from ③ Indonesia other than the defendants' sales (③A), the defendant argues that half is presumed attributable to businesses other than the plaintiff. However, there is no evidence establishing the volume imported from Indonesia by such other businesses.

Taking account of the plaintiff's assertion that it accounted for almost all of quantity ③B, and assuming that this quantity was imported by the plaintiff, the plaintiff's imports and sales (⑪) are calculated. The ratio of those imports and sales (⑪) to the quantity obtained by deducting the defendants' sales (③A) from

total imports (⑩), is then calculated. As shown in that appendix, the annual ratios during the periods of use of the defendants' processes range from ●(omitted)●% to ●(omitted)●%, and the annual average is calculated as 44.7%.

Regarding the Ministry of Finance trade statistics submitted by the defendant (Otsu 117, Materials 3–10), the plaintiff also argues that quantities not included in those materials were imported as glutamic acid and processed domestically into monosodium glutamate, and that almost all such imports were by the plaintiff. However, it has submitted no specific supporting materials, and the evidence (Otsu 101, Attachment 7) suggests that imports of such glutamic acid were small compared with imports of monosodium glutamate.

Thus, even taking the plaintiff's arguments into account, it is appropriate to find that, had the defendants' quantities not been sold during the periods of use of their respective processes, at least approximately 50% of the demand for the MSG they sold might have shifted to monosodium glutamate imported and sold by parties other than the plaintiff. A 50% rebuttal of the presumption on this basis is appropriate.

(B) Degree of contribution of the patents at issue to damages

The defendant argues that the inventions covered by these patents contribute only to a very small part of the complex and diverse processes for producing glutamic acid, and that their respective contributions to producing the MSG at issue are low. It therefore argues that calculation of damages under Patent Act Article 102(2) should take account of each patent's contribution rate, or alternatively that rebuttal should be allowed according to those contribution rates.

However, Invention 1-1 (Corrected Invention 1-1), Invention 1-2 (Corrected Invention 1-2), Invention 1-4 (Corrected Invention 1-3), and Invention 2-5 (Corrected Invention 2-5), all found to have been worked during the periods of use of the defendants' respective processes, are inventions of methods of producing glutamic acid (an amino acid) using strains with particular characteristics. Where working of these patented inventions is established through sales or other acts involving MSG produced with those strains, each patented invention must be regarded as worked in relation to the entirety of the MSG sold.

Production of glutamic acid by fermentation includes fermentation and purification stages, with multiple reactions within the strain during fermentation. Even if these patented inventions concern only particular stages or reactions, that does not establish that their contributions to production of the MSG were low. Nor does any other evidence establish circumstances warranting rebuttal of the Article 102(2) presumption for the claims based on these patents on grounds of their contribution rates. The defendant's argument cannot therefore be accepted.

[Unfair Competition Prevention Act / Imitation of Product Configuration] Osaka District Court, 2019 (Wa) 11484: "Reliance" found ⇒ Violation of Article 2(1)(iii) of the Unfair Competition Prevention Act

"The defendant, being in the same business as the plaintiff, could have made its product based on the plaintiff's product. ... The configuration of the defendant's product is substantially identical to that of the plaintiff's product. ... Furthermore, the defendant argues that, around the summer of 2017, it communicated its desired functions and image to a Chinese manufacturer and completed the design based on a product (sample) already manufactured by that manufacturer, but its explanation of that process lacks specificity. ... There are no instructions, proposals, or other evidence of communications with the manufacturer substantiating the design process. It is difficult to believe that, merely by communicating abstract functions and an image to the manufacturer by telephone as the defendant's representative testified, a product closely resembling the plaintiff's product was created by coincidence. ... Considering these circumstances together, the defendant's product is found to have been created based on the plaintiff's product."

Intellectual Property High Court, 2021 (Gyo-Ke) 10150 [Vessel] <Shoji> = 2021 (Gyo-Ke) 10151 ⇛ Inventive step upheld through a disclaimer claim

Original Ameblo publication: 2023-08-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12815755637.html

Intellectual Property High Court, 2021 (Gyo-Ke) 10150 [Vessel] <Shoji> = 2021 (Gyo-Ke) 10151 ⇒ Inventive step upheld through a disclaimer claim

① "There is no reason to interpret the specification and related documents as describing only flood-prevention chambers that also function as tanks."

+ The disclaimer claim does not change the invention's effects.

⇒ Does not introduce new technical matter

② Replacing a tank that functions as a "flood-prevention chamber" with a "flood-prevention chamber" having no tank function requires new space for a tank and prevents use as a tank of a location previously available for that purpose.

⇒ Teaching-away factor exists

⇒ Inventive step upheld through a disclaimer claim

<Some observations>

(1) Relationship between addition of new matter and inventive-step assessment for disclaimer claims. This is the fourth court decision recognizing inventive step through a disclaimer claim, although more than 1,000 disclaimer claims per year are patented through JPO examination and trial proceedings. Like the preceding three court decisions recognizing ‘inventive step’ through disclaimer claims, this judgment reasoned, in its inventive-step analysis, that excluding a particular configuration involved a teaching-away factor in relation to the problem of the primary cited invention. On the other hand, like many other decisions, when finding the correction permissible because it did not add new matter, the judgment held that the correction to a disclaimer claim did not change the invention's effects. Disclaimer claims thus involve a tension: the relationship to the problem of the invention at issue matters when assessing new matter, whereas the relationship to the cited invention's problem matters when assessing inventive step. Some say this is overly convenient for right holders. Still, this may be only a minor tension compared with the larger tension in current practice: a difference between the invention's problem and the cited invention's problem is a reason to uphold inventive step, whereas in infringement analysis, whether the accused product or process addresses the invention's problem is not treated as an issue. (2) New-matter assessment of disclaimer claims (different approaches to earlier-filed, later-published applications and inventive step). It seems that new-matter assessment for disclaimer claims is applied more strictly to amendments/corrections avoiding lack of inventive step than to those avoiding conflict with an earlier-filed, later-published application. The application passages from four decisions are quoted below. Intellectual Property High Court, 2021 (Gyo-Ke) No. 10151, Vessel <this judgment>, found that ‘because a flood-prevention chamber is permitted to have a tank function, flood-prevention chambers include both those that also function as tanks and those that do not.’ It thus adopted substantive reasoning going beyond the formal proposition that the invention’s original effects are unchanged and no new effects arise. Intellectual Property High Court, 2021 (Gyo-Ke) No. 10111, Laser Processing Apparatus, likewise found that ‘it would be unnatural to describe planned cutting lines while deliberately not describing grooves,’ adopting substantive reasoning going beyond that same formal proposition that the invention’s original effects are unchanged and no new effects arise. In Intellectual Property High Court, 2018 (Ne) No. 10006, System Operating Method (Capcom v. Koei),

addition of new matter was not disputed. The first judgment in Intellectual Property High Court, 2017 (Gyo-Ke) No. 10032, Method for Producing Conductive Material (Silver Flakes), addressed a correction adding a mechanism of action to Claim 10, separately from the disclaimer in Claim 9, and held: ‘It cannot be said that the specification, claims, or drawings attached to the application lack an express description that the “fusion” in Corrected Invention 10 results from “locally oxidizing some of the silver particles” ... and thus no new matter is added.’ This has something in common with the European Patent Office Guidelines, which permit undisclosed disclaimers in certain circumstances to restore novelty over earlier-filed applications and certain other disclosures, but do not permit them to contribute to inventive-step assessment. Where the excluded subject matter was disclosed in the application as filed, a different test applies: whether the invention remaining after the exclusion is directly and unambiguously derivable from the application as filed.

(Extract from the court's reasoning)

① ... Because a "flood-prevention chamber" is permitted to have a tank function, such chambers are recognized as including both those that also function as tanks and those that do not. There is no reason to interpret the specification and related documents as describing only chambers that also function as tanks. They therefore disclose both a "flood-prevention chamber" with a tank function and one without it. Since both inventions—with and without a tank function—were disclosed, ... correcting Claim 1's "flood-prevention chamber" to a "flood-prevention chamber (excluding a tank)" without a tank function, thereby excluding the invention with a tank function, clearly introduces no new technical matter. Nor is there any reason to interpret the correction as transforming the invention into one producing new effects without producing its original effects: even if the side wall near a partition is damaged, only the flood-prevention chamber floods, not multiple rooms, thereby preventing flooding across multiple rooms when the vessel is damaged while restraining enlargement of those rooms and increasing design freedom. There is therefore no room to regard new technical matter as introduced through a change in the invention's effects caused by the correction.

② ... The "stern trimming tank (ballast water tank)" in the Ko 6 invention inherently functions as a tank, faces the side wall, and is a room with a watertight structure that prevents flooding of the "room" in which it is installed even if the side wall is damaged and water enters. It therefore also qualifies as a "flood-prevention chamber" and is a chamber that also functions as a tank [the source here uses the expression ‘watertightness-prevention chamber’]. However, there is no evidence suggesting separate construction of the tank and a "flood-prevention chamber" without a tank function in place of a chamber serving both purposes. Nor is there evidence suggesting placement of a nontank "flood-prevention chamber" at the location of a tank originally designed to function as a tank and also understood to function as a flood-prevention chamber, while placing a separate tank elsewhere. Thus no motivation is recognized in the Ko 6 invention to construct the "stern trimming tank (ballast water tank)" separately as a tank and a nontank "flood-prevention chamber," or to replace it with an empty space serving as a "flood-prevention chamber."

Moreover, separately constructing a tank and a "flood-prevention chamber" without a tank function, and replacing a tank originally designed to function as a tank and also understood to function as a flood-prevention chamber with a nontank flood-prevention chamber, would require new space to house the tank. It would also make a location previously usable as a tank unavailable for that purpose, impairing design freedom. There is therefore a teaching-away factor against doing so. Accordingly, a person skilled in the art could not readily have conceived of replacing the Ko 6 invention's "stern trimming tank (ballast water tank)" with an empty space serving as a "flood-prevention chamber" and placing a "stern trimming tank (ballast water tank)" in the rear room.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91422.pdf

Intellectual Property High Court, 2022 (Gyo-Ke) 10029 [Antiglare Film] <Shoji>

Original Ameblo publication: 2023-08-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12815756027.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10029 [Antiglare Film] <Shoji>

① Enablement upheld even if the embodiments described in the specification include shapes and structures outside the claims (support requirement also upheld)

② Measurement conditions are inherently subject to limits, and a person skilled in the art measures reasonably ⇒ Clarity requirement satisfied

③ Where two parameters are interrelated, the court found no suggestion to adjust only one parameter of the primary cited invention independently of the other ⇒ Inventive step upheld

[Claim 1] "An antiglare film ... having a haze value within the range of 60% to 95%, inclusive, and an internal haze value within the range of 0.5% to 8.0%, inclusive."

(Extract from the court's reasoning)

① Even if some antiglare films obtainable by the first embodiment cannot be made by the second or third embodiment, this does not negate the ability to work the inventions through the first embodiment. Even if some second-structure antiglare layers made by the second embodiment and third-structure antiglare layers made by the third embodiment have shapes and structures different from the first-structure antiglare layer and do not satisfy the inventions' three optical characteristics, this merely means that those layers do not embody the inventions; it does not negate enablement of the inventions.

② ... A person skilled in the art would seek to set measurement conditions to avoid fluctuations in the results. There is no evidence showing that conditions avoiding fluctuations cannot be set when obtaining the standard deviation of the luminance distribution in the inventions. Moreover, ... it cannot be supposed that a person skilled in the art would measure ... luminance distribution under conditions that produce a marked divergence from the sparkle perceived by display users. Accordingly, permissible conditions for measuring luminance distribution in the inventions are subject to limits, such as setting them so that results for the same antiglare film remain constant without fluctuation. A person skilled in the art can be inferred to set and measure under conditions within a reasonable range subject to those limits. ...

③ Difference 1-1: In Invention 1 the "antiglare layer" has "an internal haze value within the range of 0.5% to 8.0%, inclusive," whereas the cited invention's "internal haze value" is unknown. ...

Reference 2 ... states that specifying surface haze more specifically expresses the degree of unevenness (the surface diffusion element). ... The surface haze value defines the shape of the unevenness, which is technically inseparable from sparkle, so Reference 2 cannot be understood as suggesting adjustment of sparkle independently of surface haze. ... Well-Known Reference A1 also states that "internal haze is preferably 5–30%," but also states that "surface haze is preferably 20–50%." ... It therefore does not suggest adjusting sparkle independently of surface haze either.

Tokyo District Court, 2022 (Wa) 9716 [5-Aminolevulinic Acid Phosphate] <Shibata>

Original Ameblo publication: 2023-08-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12816299668.html

Tokyo District Court, 2022 (Wa) 9716 [5-Aminolevulinic Acid Phosphate] <Shibata> July 28, 2023

<Whether the claim limitations are met>

An invention of a novel substance: the claim is satisfied even without isolation and even at low concentration!!

Cf. Tokyo High Court, 2003 (Ne) 3034 <Shinohara>

[Process for Producing a Morphologically Homogeneous Form of a Thiazole Derivative]

* The mixture was prior art ⇒ The invention was a particular crystalline form!

"... Taking the prosecution history into account ... on the premise that a mixture of Form A ... and Form B ... existed ... it was limited to the particular crystalline form ‘Form B famotidine.’"

<Invalidity>

Novelty upheld: The reasoning is the same as in Intellectual Property High Court, 2022 (Gyo-Ke) 10091 [5-Aminolevulinic Acid Phosphate] <Shoji>, March 22, 2023

⇒ Even if a substance's name appears in a cited reference, disclosure is not recognized unless a person skilled in the art is found able to carry it out without exercising creative ability through thought, trial and error, or similar efforts.

⇒ The cited reference and other materials, together with common general technical knowledge, must have enabled production of ‘the phosphate,’ at least as part of a mixture.

★ At the filing date, the phosphate was difficult to produce!!

⇒ This connects with the third requirement of the doctrine of equivalents!!

<Some observations>

In its analysis of whether the claim limitations were met, this judgment held that the accused products satisfied the claim merely by containing the invention's 5-aminolevulinic acid phosphate in a mixture, even though it was not isolated. At the beginning of its novelty analysis, the judgment stated, ‘It is not recognized that technology for obtaining 5-aminolevulinic acid in its free form was well known at the priority date.’ One might hastily think this contradicts the infringement analysis. Reading further, however, it stated that ‘it cannot be assessed that the compound 5-aminolevulinic acid phosphate was produced.’ The lack-of-novelty argument was rejected because a person skilled in the art was not found to have been able to produce the novel compound without exercising creative ability through thought, trial and error, or similar efforts at the priority date. In this case, the cited reference stated the substance's name (the invention's 5-aminolevulinic acid phosphate), but because a person skilled in the art was not found to have been able to carry it out without exercising creative ability through thought, trial and error, or similar efforts, disclosure in the reference was not recognized, or its eligibility as a cited invention was denied. Not only this judgment but many court decisions require that, for a cited invention to be recognized as disclosed in a reference, a person skilled in the art must be able to carry out the relevant configuration and other features without exercising creative ability through thought, trial and error, or similar efforts, based on the reference's disclosure and common general technical knowledge. Applied here, it was necessary that a person skilled in the art could produce ‘5-aminolevulinic acid phosphate’ at least as part of a mixture

without exercising creative ability through thought, trial and error, or similar efforts. However, the state of the art at the priority date made it difficult not only to isolate the substance but also to produce 5-aminolevulinic acid ‘phosphate’ even in a mixture. The lack-of-novelty argument was therefore rejected despite the name appearing in the reference. One should always keep in mind the possible counterargument, as in this case, that even if a published document names the compound of the invention, a person skilled in the art could not produce it without exercising creative ability through thought, trial and error, or similar efforts at the state of the art at the priority date. Thus there is no contradiction between this judgment's infringement and invalidity analyses. At the filing date (priority date), the skilled person could not produce the compound without exercising creative ability through thought, trial and error, or similar efforts, whereas infringement was found because the accused products actually contained the claimed compound. This was not a finding that the specification’s disclosure caused manufacture to become possible. Enablement and support are separate issues. This situation has something in common with the third requirement of the doctrine of equivalents. The third requirement concerns whether the substitution would have been easy at the time of manufacture or other relevant acts. The fourth concerns whether the accused product or process was identical to, or readily inferable from, the prior art at filing. The different assessment dates offer a point of comparison, but the subjects of the two inquiries also differ; equivalence does not require that a single form of ease change over time. However, under the general approach adopted by this and many other judgments, even where a published reference names the compound, novelty and inventive step are not immediately negated unless it can be proved that the skilled person could produce the compound without exercising creative ability through thought, trial and error, or similar efforts at the state of the art at the filing date (priority date). The first person to succeed in producing a particular compound within a mixture may therefore obtain a product patent without isolating it, provided the other patentability requirements are also met, and may enforce that patent against persons working mixtures containing the compound. Here, 5-aminolevulinic acid was known, the novel substance was its ‘phosphate,’ and the compound ‘5-aminolevulinic acid phosphate’ itself was expressly named in published literature. Where the invention's technical significance lies in first enabling manufacture of the ‘phosphate,’ there is room to debate whether granting a product patent rather than a manufacturing-process patent strikes the right balance, and whether enforcement should be allowed against alleged infringers who produce or otherwise deal in mixtures containing the compound through processes other than the one actually invented. This issue also relates to IP High Court, 2007 (Gyo-Ke) No. 10378 [Crystalline Azithromycin Dihydrate]. That judgment asked whether a skilled person could understand the cited reference as describing a product identical to the invention on the basis of the common general technical knowledge and state of the art before the priority date. It did not treat the mere factual existence of an identical product before that date as decisive. The court held that the cited reference did not disclose the invention’s configuration, without deciding whether the crystal described in that reference could objectively be identified as azithromycin dihydrate. Taking that reasoning as a starting point, one can consider the hypothetical case in which the substance was not actually new but the inventor first recognized its presence. Whether granting a product patent in that situation strikes the right balance, and whether enforcement should be allowed against alleged infringers continuing to manufacture and sell the prior art—products actually containing the substance although no one had noticed it—are matters of debate in relation to the public domain.

(Extract from the court's reasoning)

<Whether the claim limitations are met> ⇒ Because this is an invention of a novel substance, the claim is satisfied even without isolation and even at low concentration!!

The defendant argues that its products do not fall within the technical scope of the invention because they are amino-acid-containing foods, the 5-aminolevulinic acid phosphate is not isolated, and its purity is low. However, the invention concerns a novel chemical substance. Its purpose is to provide 5-aminolevulinic acid phosphate as a novel chemical substance, not to increase its purity. If it is the

invention's 5-aminolevulinic acid phosphate, it can be said to produce the invention's effects even if it is not isolated and even if its concentration in the containing product is not high.

<Invalidity (novelty)>

⇒ Novelty upheld (same reasoning as Intellectual Property High Court, 2022 (Gyo-Ke) 10091 <Shoji>)

... References Otsu 16–18 cannot be said to disclose technology for obtaining 5-aminolevulinic acid in its free form. In addition, ... the cited reference states that '5-ALA is ... chemically extremely unstable' and that 'only acidic aqueous solutions of 5-ALA HCl are shown to be sufficiently stable' ([0007]). Considering also that these matters were common general technical knowledge at the priority date, technology for obtaining 5-aminolevulinic acid in its free form cannot be recognized as well known at that date.

On this point, the plaintiff argues that production of 5-aminolevulinic acid phosphate does not require 5-ALA to have been extracted as a substance, and that it may remain mixed with culture-medium components and the like in a fermentation liquid. However, at the priority date, adding acid or base to a mixture containing various components was not recognized as common general technical knowledge for producing a salt compound. A skilled person encountering the cited reference at that date therefore could not, without exercising creative ability such as thought or trial and error, have found the method of adding phosphoric acid to fermentation liquid containing 5-aminolevulinic acid mixed with medium components (or adding that fermentation liquid to a phosphoric acid solution) as a method for producing the compound 5-aminolevulinic acid phosphate. Furthermore, ... as is also evident from Otsu 17's description of yeast extract, tryptone, and other ingredients in the medium, fermentation liquid mixed with medium components contains various ions as impurities. Even if phosphoric acid is added to such liquid, it cannot be assessed that the compound 5-aminolevulinic acid phosphate has been produced through neutralization of equal molar amounts of acid and base. ... There are no other circumstances indicating that a skilled person at the priority date could have found a method of producing or otherwise obtaining 5-ALA phosphate. ...

Accordingly, a skilled person encountering the cited reference at the priority date could not, without exercising creative ability such as thought or trial and error, have found a method of producing or otherwise obtaining 5-ALA phosphate based on the common general technical knowledge at that date. Thus 5-ALA phosphate cannot be identified as a cited invention from that reference.

Intellectual Property High Court, 2022 (Gyo-Ke) 10059 [Glass] <Kanno>

Original Ameblo publication: 2023-08-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12816621161.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10059 [Glass] <Kanno>

* The court identified the invention's problem as distinct from its physical-property requirements, and held that it was unnecessary for a product meeting the composition requirements to be likely to meet the physical-property requirements.

⇒ Glass meeting the composition requirements but not the physical-property requirements simply falls outside the claims.

Distinguished from Intellectual Property High Court, 2016 (Gyo-Ke) 10189 [Optical Glass] <Tsuruoka>!!

[Claim 1] ... Glass that is oxide glass having a liquidus temperature of 1140°C or below, a glass transition temperature of 672°C or above, a refractive index nd in the range of 1.825–1.850, and an Abbe number vd of 41.5–44

(Extract from the court's reasoning)

The plaintiff argues ... that some glass meets the composition requirements but not the physical-property requirements, making it impossible to find a correlation between satisfying the two sets of requirements ... .

However, the invention's problems are ... to further enhance the usefulness of high-refractive-index, low-dispersion glass by reducing the proportions of Gd, Ta, and Yb in its composition; to provide glass with superior thermal stability; and to provide glass suitable for machining. It seeks to solve those problems by adopting a configuration satisfying both the composition and physical-property requirements.

Accordingly, the composition and physical-property requirements cannot be said to stand in a problem-and-solution relationship. It is therefore unnecessary to recognize a relationship under which glass defined by the composition requirements has a high probability of satisfying every physical-property requirement, including glass transition temperature. The claims cover glass satisfying both sets of requirements; they do not assert that, throughout the entire numerical ranges of the composition requirements, every glass satisfying those requirements also satisfies the physical-property requirements. Any glass meeting the former but not the latter simply falls outside the claims. Moreover, in light of the numerical ranges described as preferred in the specification and the reasons for selecting them, it is difficult to find the composition ranges excessively broad. ...

(The plaintiff argues that the support requirement should be assessed here using the standard stated in another IP High Court judgment (Ko 7): ‘A person skilled in the art can recognize, from the description or suggestions in the detailed description or common general technical knowledge at the filing date, that the optical glass defined by the composition requirements is highly likely to satisfy the physical-property requirements.’ However, support must be assessed in relation to the invention's problem. In that other judgment, the problem was ‘providing optical glass with specified optical constants, a high refractive index and high dispersion, and a small partial dispersion ratio.’ It is inappropriate simply to apply to this case reasoning given as a fact-specific determination concerning a different problem in a different invention.)

Osaka District Court, 2018 (Wa) 5189 [Nutrient Supplement for Farmed Fish and Shellfish and Method for Producing It] <Tani>

* Working by a co-owner exhausted the patent right.

⇒ The manufacturing-process patent is exhausted with respect to those products already sold, too!!

= Appeal, Intellectual Property High Court, 2019 (Ne) 10065

"Where the defendant's products were manufactured as embodiments of the jointly owned patented invention and sold to the defendant company, the jointly owned patent right ... is exhausted."

※The IP High Court Grand Panel judgment in the Ink Tank case (not the Supreme Court judgment) stated in obiter dicta, broadly speaking, that a manufacturing-process patent is exhausted in circumstances where indirect infringement would otherwise arise. However, the passage '(... whether this is called "exhaustion" of the patent right or an "implied license" is merely a matter of expression)' has also been criticized.

⇒ By contrast, Osaka District Court, 2018 (Wa) 5189 is noteworthy for unequivocally stating that the right is 'exhausted.'

https://www.courts.go.jp/ip/vc-files/ip/file/10021.pdf

(Extract from the court's reasoning)

Defendant P2, a co-owner of the jointly owned patent right, ... can work the jointly owned patented invention without the plaintiff's consent. Thus, if P2 manufactured the defendant's products as embodiments of that invention and sold them to the defendant company, the jointly owned patent right would be exhausted as having achieved its purpose. The plaintiff, as another co-owner, could not exercise the patent right against the defendant company's transfer or other disposal of those products. The defendant company also sold to third parties products it had purchased from the dissolved company. Those products had been manufactured under a license from the plaintiff and Defendant P2, the joint patentees, and sold to the defendant company; the jointly owned patent right is therefore likewise considered exhausted for those products.

[Trademark] Intellectual Property High Court, 2022 (Gyo-Ke) 10073 <Kanno>, the zhiyun case

Original Ameblo publication: 2023-08-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12816838841.html

[Trademark] Intellectual Property High Court, 2022 (Gyo-Ke) 10073 <Kanno>, the zhiyun case

Violation of Article 4(1)(vii) (contrary to public policy)

"This is a case of making large numbers of plagiaristic trademark applications under the guise of the first-to-file principle ... unrelated to the function of identifying commercial origin, to obtain financial gain ... . It is not merely a private issue between particular parties; there is a serious violation concerning the fair trading order itself."

(Extract from the court's reasoning)

Before September 24, 2018, the filing date of the trademark application at issue, the defendant had achieved substantial overseas sales of stabilizers and other products bearing the cited mark or similar marks. In Japan as well, gimbal heads and stabilizers bearing the cited mark or similar marks had been sold on Amazon Japan since no later than July 13, 2016. The defendant participated in a trade fair in 2017 and entered the Japanese market in earnest in 2018.

According to C above, this application was one of a large number filed by the plaintiff between September 25, 2017 and May 11, 2021. Twenty-two of those registrations were transferred within one or two years after registration; at least eighteen had been applied for after others began using similar marks. Many of the plaintiff's marks were distinctive coined words that could not plausibly have coincidentally matched the earlier marks, and the plaintiff also sought royalties for the mark at issue.

These circumstances compel the conclusion that the plaintiff is in the business of obtaining financial gain by filing applications for marks similar to others' earlier-used marks under the guise of the first-to-file principle. The mark at issue, too, is a coined word that cannot be regarded as Japanese or English and cannot be found independently devised by the plaintiff. It can be inferred that, knowing of the defendant's substantial overseas sales of stabilizers and gimbal heads bearing the cited mark, the plaintiff sought financial gain by obtaining the first Japanese registration for the same designated goods. In light of the circumstances leading to the application, granting registration would be gravely contrary to the fair trading order envisaged by the Trademark Act. The registration must therefore be regarded as contrary to public policy.

Intellectual Property High Court, 2018 (Ne) 10034 [Solenoid] <Kanno>

<Damages for a jointly owned patent>

* Calculation under Patent Act Article 102(2)

— Deduct the royalty-equivalent amount payable to a co-owner under paragraph (3).

* Calculation under Patent Act Article 102(1)

— Unlike the presumption of damages under paragraph (2), the royalty-equivalent amount payable to a co-owner under paragraph (3) cannot be deducted.

(Extract from the court's reasoning)

For damages calculated under Patent Act Article 102(1), the amount obtained by multiplying the quantity of the articles constituting the infringing act transferred by the infringer by the profit per unit of the products the patentee or other right holder could have sold absent infringement does not include the nonworking co-owner's royalty-equivalent damages corresponding to the transferred quantity. Nor does that amount constitute a circumstance preventing the patentee or other right holder from selling all or part of that quantity. Therefore, unlike the presumption of damages under paragraph (2) discussed below, the nonworking co-owner's royalty-equivalent amount cannot be deducted.

... Royalty-equivalent damages may be claimed irrespective of whether the patent is worked. Even a co-owner who does not work the jointly owned patent may therefore receive royalty-equivalent damages presumed under Patent Act Article 102(3) when it is infringed. If the entire amount presumed under paragraph (2) were treated as the working co-owner's damage, the infringer would become liable for damages exceeding its actual profits. Accordingly, when a working co-owner claims the infringer's profits as damages under paragraph (2), the nonworking co-owner's damages presumed under paragraph (3) should be deducted.

Intellectual Property High Court, 2020 (Ne) 10004 [Light Irradiation Device] <Otaka>

Note: Damages where the other co-owner also worked the invention

(The issue of ‘encroachment’ under a prior user right is also important!!)

‘... When the infringer alleges and proves that another co-owner works the patented invention, the presumption under paragraph (2) is rebutted ... through apportionment according to the extent of the other co-owner's working (the ratio of profits from working among the co-owners) ...’

(Extract from the court's reasoning)

The fact that the patent is jointly owned and that another co-owner earns profits from working the patented invention may constitute grounds for rebutting the presumption. Where the infringer alleges and proves joint ownership, the presumption is rebutted to the extent of royalty-equivalent damages under paragraph (3) corresponding to the other co-owner's ownership share. Where the infringer alleges and proves that another co-owner works the invention, it is appropriate to construe the paragraph (2) presumption as rebutted to the extent of damages apportioned according to that co-owner's extent of working (the ratio of profits from working among co-owners).

IP High Court Grand Panel, 2019 (Ne) 10003 [Beauty Device] <Damages> Rebuttal circumstances: 50% under the proviso to Article 102(1)

Original Ameblo publication: 2023-09-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12818608181.html

IP High Court Grand Panel, 2019 (Ne) 10003 [Beauty Device]

<Damages> Rebuttal circumstances: 50% under the proviso to Article 102(1)

Price difference: Plaintiff's product, 24,000 yen; defendant's products, 3,000–5,000 yen

Circumstances applicable to both parties' products

⇒ Not rebuttal circumstances

The plaintiff's product generates a microcurrent

⇒ The defendant's products have weaker customer-attracting power

⇒ Not rebuttal circumstances

<Rebuttal circumstances> Proviso to Article 102(1): Circumstances preventing the plaintiff from selling its product

Price difference: The plaintiff's product costs 24,000 yen, while the defendant's products cost 3,000–5,000 yen. Purchasers of the defendant's products would not necessarily have purchased the plaintiff's product if the defendant's products had not existed.

It is difficult to recognize any rule of experience that people buying goods from major mail-order retailers or department stores do not buy goods at discount stores or variety shops. Apart from the price difference, the differences in sales methods between the plaintiff's and defendant's products are not found to influence purchase motivations and cannot be recognized as circumstances preventing sales.

Competing products: There is insufficient evidence that products competing with the plaintiff's product were sold in the market, so this cannot be recognized as a circumstance preventing sales.

The defendant's asserted circumstance that ‘the bearing portion cannot be recognized from external appearance’ applies to both parties' products. Its existence therefore cannot mean that, absent the defendant's products, demand would not shift to the plaintiff's product. These circumstances cannot be recognized as preventing sales.

The plaintiff's product has a mechanism generating a microcurrent, whereas the defendant's products do not. This means that the defendant's products have weaker customer-attracting power than the plaintiff's product, and can hardly be considered a circumstance preventing demand from shifting to the plaintiff's product in their absence.

<Contribution rate>

The fact that Invention 2 is characterized by only part of the beauty device has already been considered in calculating the plaintiff's profit per unit, so it need not be considered again.

(Extract from the court's reasoning)

Circumstances under the proviso to Article 102(1)

(A) The first-instance defendant asserts differences in prices and retail outlets between the parties' products as circumstances preventing sales.

a. As stated in (2)C and (3)A above, the plaintiff's product is sold by major mail-order retailers and department stores for 23,800 yen or a similar price, whereas the defendant's products are sold at discount stores and variety shops for approximately 3,000–5,000 yen. The plaintiff's product is thus a relatively expensive beauty device, while the defendant's products cost only approximately one-eighth to one-fifth as much. Purchasers of the defendant's products would not necessarily have purchased the plaintiff's product in their absence. The price difference can therefore be recognized as a circumstance preventing sales.

Because this price difference is not small, the quantity corresponding to sales prevented by it is likewise recognized as not small.

On the other hand, both products are beauty devices. Given the nature of such goods, it can be inferred that a considerable number of customers do not prioritize price: they buy an inexpensive product if available, but buy an expensive one if no inexpensive option exists. Moreover, as stated in (3)A above, the plaintiff's product has platinum-coated roller surfaces and a solar panel generating a microcurrent, so its quality is higher than that of the defendant's products lacking these features. Thus, even at approximately 24,000 yen, the plaintiff's product can attract a certain number of customers for the defendant's products priced around 3,000–5,000 yen. Accordingly, the quantity corresponding to sales prevented by the price difference cannot be recognized as particularly large.

b. The price difference can thus be said to influence purchase motivations. However, it is difficult to recognize any rule of experience that people buying goods from major mail-order retailers or department stores do not buy goods at discount stores or variety shops. Apart from price, the differences in sales methods are not found to influence purchase motivations and cannot be recognized as circumstances preventing sales.

(B) The first-instance defendant asserts the existence of numerous competing products as a circumstance preventing sales.

At least 29 kinds of products of the same type as the parties' products were sold as of April 2019 (Otsu 176 and the entire purport of oral argument). However, the evidence is insufficient to establish that products competing with the plaintiff's product were sold in the market during the infringement period (December 4, 2015 to May 8, 2017). This cannot therefore be recognized as a circumstance preventing sales.

(C) The first-instance defendant argues that Invention 2 concerns a bearing, whose manufacturing cost is only a small part of the defendant's products' total manufacturing costs, and that the bearing is akin to an accessory; it asserts this as a circumstance preventing sales.

However, the fact that Invention 2 is characterized by only part of the beauty device has already been considered in calculating the plaintiff's profit per unit. It need not be considered again as a circumstance preventing sales.

(D) The first-instance defendant asserts that the bearing portion is not externally visible and that alternative technology exists, among other circumstances preventing sales.

However, these circumstances apply to both parties' products. Their existence therefore cannot mean that demand for the defendant's products would not shift to the plaintiff's product in their absence, and they cannot be recognized as circumstances preventing sales.

(E) The first-instance defendant asserts as a circumstance preventing sales that the plaintiff's product has a microcurrent-generating mechanism, whereas the defendant's products do not.

As stated in (3)A above, the plaintiff's product indeed has a microcurrent-generating mechanism, while the defendant's products do not. However, this means that the defendant's products have weaker customer-attracting power. It can hardly be considered a circumstance preventing demand from shifting to the plaintiff's product in their absence. It cannot therefore be recognized as a circumstance preventing sales.

(F) The first-instance defendant asserts its own sales efforts as a circumstance preventing sales. However, the evidence does not establish sales efforts of a degree sufficient to qualify as such a circumstance.

C. In view of the foregoing, taking account of the circumstances discussed in B(A)a above, it is appropriate to find that the quantity corresponding to the circumstance preventing sales is approximately 50% of the total.

Contribution rate

As stated in (3) and (5) above, when calculating the plaintiff's profit per unit, it is appropriate to deduct 60% from the full marginal profit to account for the degree to which Invention 2 contributes to profits from sales of the plaintiff's product. It is also appropriate to deduct 50% under the proviso to Patent Act Article 102(1) from the first-instance plaintiff's damages calculated by multiplying the defendant's sales quantity by that profit per unit. Even if the first-instance defendant's argument seeks a further reduction, separate from these deductions, based on Invention 2's contribution to sales of the defendant's products, there is no statutory provision or other basis permitting it. Such a further contribution-based reduction cannot be allowed.

https://www.nakapat.gr.jp/ja/legal_updates_jp/%E3%80%90%E7%89%B9%E8%A8%B1%E2%98%85%E2%98%85%E3%80%91%E3%80%8C%E7%BE%8E%E5%AE%B9%E5%99%A8%E3%80%8D%E4%BA%8B%E4%BB%B6%EF%BC%8D%E7%89%B9%E8%A8%B1%E6%B3%95%EF%BC%91%EF%BC%90%EF%BC%92%E6%9D%A1%EF%BC%91/

Tokyo District Court, 2017 (Wa) 29228 [Fluid Supply Device] <Damages> Rebuttal of the Article 102(2) presumption: 40%

Original Ameblo publication: 2023-09-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12818904762.html

Tokyo District Court, 2017 (Wa) 29228 [Fluid Supply Device]

<Damages> Rebuttal of the Article 102(2) presumption: 40%

(Note) The following concerns the damages analysis in the first-instance judgment. The appellate judgment of the Intellectual Property High Court of June 28, 2021, 2020 (Ne) 10044 [Fluid Supply Device] <Tsuruoka>, reversed the portion of the first-instance judgment in which the plaintiff prevailed and dismissed the claims relating to that portion.

In addition to market circumstances surrounding setting devices at gas stations, 'the defendant had strong business and other relationships with former EMG-affiliated gas stations.'

⇒ It could not be found that the plaintiff could have sold as many setting devices as the defendant sold.

<Rebuttal circumstances>

In light of market circumstances surrounding gas-station setting devices and the defendant's strong business and other relationships with former EMG-affiliated stations, the plaintiff could not be found capable of selling as many devices as the defendant sold. Rebuttal at a rate of 40%.

(Extract from the court's reasoning)

The presumption under Patent Act Article 102(2) is understood to be rebutted where circumstances disrupting an adequate causal relationship between the infringer's profits and the patentee's damage are established.

In light of the market circumstances described above and indications that the defendant had strong business and other relationships with former EMG-affiliated gas stations, it cannot be found that the plaintiff could have sold as many setting devices as the defendant sold. Circumstances disrupting an adequate causal relationship between the infringer's profits and the patentee's damage are therefore recognized. The foregoing establishes that the plaintiff could not have sold equivalent devices for at least 40% of the defendant's unit sales (total unit sales ●(omitted)● × 0.4 = ●(omitted)●). Consequently, the presumption of damages under Patent Act Article 102(2) arising from sales of the defendant's setting devices is rebutted by 40%.

https://www.nakapat.gr.jp/ja/legal_updates_jp/%E3%80%90%E7%89%B9%E8%A8%B1%E2%98%85%E3%80%91%E7%89%B9%E8%A8%B1%E6%A8%A9%E4%BE%B5%E5%AE%B3%E5%B7%AE%E6%AD%A2%E7%AD%89%E8%AB%8B%E6%B1%82%E4%BA%8B%E4%BB%B6%EF%BC%88%E7%89%B9%E8%A8%B1%E6%A8%A9%E8%80%85/

Osaka District Court, 2017 (Wa) 7576 [Spacer for Foundation Packing] Grounds for rebutting the Article 102(2) presumption: 70%

Original Ameblo publication: 2023-09-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12818905126.html

Osaka District Court, 2017 (Wa) 7576 [Spacer for Foundation Packing]

<Damages> Grounds for rebutting the Article 102(2) presumption: 70%

The defendant's catalogue emphasizes matters other than the invention (strength and ventilation performance; stability of supply, quality, and price; and a labor-saving installation product with a distinctive, easy-to-cut shape, among other things).

The product may be used without producing the invention's effects.

<Grounds for rebutting the presumption>

The defendant's catalogue does not conclusively establish that the effect ‘does not hurt when held with bare hands’ arises from the ‘tapered portion.’ Nor does it mention the invention's effects.

The catalogue lists ‘fast installation’ among ‘six features,’ but does not explain the structure of the connecting portion described as a ‘coupling structure,’ how connection occurs, or its effects.

⇒ The catalogue emphasizes matters other than the invention (the product's strength and ventilation performance; stability of supply, quality, and price; and a labor-saving installation product with a distinctive, easy-to-cut shape, among other things).

This also applies to the plaintiff’s catalogues and those of other companies in the industry. Although the plaintiff’s catalogues mention the “tapered portion” and “connecting portion,” their structures are not specifically shown, and their effects are emphasized less than other features.

The defendant's product may be used in a manner that does not produce the invention's effects.

The defendant points to increased sales after changing the product's shape, but the data merely aggregate sales for four months after the change.

(Extract from the court's reasoning)

Rebuttal grounds

• Products asserted by the defendant to be competitors ⇒ Rejected because they were not recognized as competing products

• Considering the existence and degree of the technical significance of Patents 2 and 3 in Defendant Product 2 from the perspective of customer-attracting power, first, the defendant's catalogue states among its ‘six features’ that Product 2 ‘does not hurt when held with bare hands.’ Taking account also of the defendant's interpretation of ‘tapered portion,’ this could be understood to suggest such a portion, but it does not specifically explain what configuration makes the product painless to hold with bare hands. The accompanying photograph shows fingers inserted through the anchor-bolt opening and the entire palm gripping one of the members forming the long sides around that opening (Ko 4, Otsu 32). It therefore cannot be conclusively said that the effect arises from the tapered portion. Nor is there any reference to Effect 2 of Invention 2.

The catalogue also lists ‘fast installation’ among its six features, with the description ‘coupling structure’ attached to the connecting portion at one end of Defendant Product 2. However, it does not explain the structure of that connecting portion, the manner of connection, or its effects.

Rather, as found above, the catalogue emphasizes Product 2's strength and ventilation performance; stability of supply, quality, and price; and its labor-saving installation and distinctive, easy-to-cut shape, among other things.

This is also common to the plaintiff's and competitors' catalogues and other materials. Although the plaintiff's materials mention the tapered and connecting portions, their structures are not specifically shown, and their effects receive less emphasis than other descriptions.

Instead, easy installation around the entire perimeter and specially structured ventilation slits and rodent-proofing materials are prominently emphasized.

In addition to these circumstances, it cannot be denied that Defendant Product 2 may be used without producing Invention 2's effects. (However, because the proportion of such use in practice is unknown, this circumstance cannot be overemphasized in rebutting the presumption.) There are also, as stated above, other methods of preventing movement of the foundation packing member in the width direction. In view of this, although Inventions 2 and 3 have some customer-attracting power through ease of installation, the customer-attracting power attributable to Invention 2's tapered portion and the configurations in Elements 3C–3G of Invention 3 is relatively small.

The defendant points out that sales increased after changing Product 2's shape. However, the supporting material (Otsu 60) merely aggregates four months' sales after the change, and various factors may cause sales fluctuations. This circumstance therefore cannot immediately substantiate that Patents 2 and 3 have only a small influence on demand for Product 2.

Considering these circumstances comprehensively, it is appropriate to find the presumption under Patent Act Article 102(2) rebutted to the extent of 70%. The contrary arguments of both the plaintiff and defendant cannot be accepted.

Tokyo District Court, 2015 (Wa) 23843 [Raw Seaweed Foreign-Matter Removal Machine]

<Damages> No rebuttal of the Article 102(2) presumption

The invention avoids co-rotation, prevents clogging of the clearance, and achieves efficient, continuous separation of foreign matter. It concerns a central structural part of the raw seaweed foreign-matter removal apparatus. ... A reduction in its contribution rate is inappropriate.

<Contribution rate>

The invention avoids co-rotation, prevents clogging of the clearance, and achieves efficient, continuous separation of foreign matter. It concerns a central structural part of the raw seaweed foreign-matter removal apparatus.

⇒ It is inappropriate to reduce the invention's contribution rate to sales of the defendant's products.

(Extract from the court's reasoning)

Contribution rate

The defendants argue that the inventions' contribution should be fully considered when calculating damages, specifying contribution rates of 10% for the defendant's apparatus, 25% for the fixed ring at issue, and 100% for the plate-shaped member at issue.

However, the inventions avoid co-rotation, prevent clearance clogging, and achieve efficient, continuous foreign-matter separation. They must be regarded as concerning a central structural part of the raw seaweed foreign-matter removal apparatus.

Even if conventional raw seaweed foreign-matter removal apparatuses passed a raw seaweed mixture through a clearance between a sorting casing (fixed ring) and a rotating disc to separate and remove foreign matter unable to pass through, those conventional devices clearly had the problems solved by the inventions. This is inferred to have a strong influence on customers' purchasing behavior. Considering this, and the absence of allegations or proof concerning current sales of conventional devices, working the inventions appears indispensable to customers for raw seaweed foreign-matter removal apparatuses.

Conversely, the defendants' arguments for reducing the inventions' contribution to their products all lack specificity.

It is therefore inappropriate to reduce the inventions' contribution rate to sales of the defendant's products.

Tokyo District Court, 2015 (Wa) 16829 [Termite-Control Composition] <Damages> Grounds for rebutting the Article 102(2) presumption: 30%

Original Ameblo publication: 2023-09-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12819157728.html

Tokyo District Court, 2015 (Wa) 16829 [Termite-Control Composition]

<Damages> Grounds for rebutting the Article 102(2) presumption: 30%

The invention's effects are among the most important effects of the defendant's product, a termite-control composition.

The defendant's customers are building contractors and the like; its sales efforts and continuing customer relationships played a substantial role in its sales.

<Rebuttal circumstances>

The invention's effects are among the most important effects of the defendant's termite-control composition and are strongly connected to customers' willingness to buy.

On the other hand, the customers are building contractors and the like, and the product is not of a nature to be retailed to ordinary consumers. It cannot be denied that factors such as the defendant's sales efforts and continuing customer relationships played a substantial role in its sales.

⇒ Substantial rebuttal of the presumption under Article 102(2) is not warranted. The presumption is rebutted to the extent of 30%.

(Extract from the court's reasoning) Rebuttal rate

The corrected invention's above effects are among the most important effects of the defendant's termite-control composition and are strongly connected to customers' willingness to buy.

On the other hand, the defendant's product is a termite-control agent applied to building materials in the foundation area beneath floors to form a coating. Its customers are building contractors and the like, and it is not of a nature to be retailed to ordinary consumers. It cannot be denied that the defendant's sales efforts and continuing customer relationships played a substantial role in sales. The evidence (Ko 6, 63, 64-1 and 64-2, 68, 76-1 and 76-2) establishes that distributors and architects who used the product offered opinions concerning its boric-acid content and introduced the inclusion of charcoal and boric acid as characteristics of the product. These facts also suggest that the defendant had built continuing relationships with customers.

As stated above, the corrected invention concerns the entire coating-forming termite-control composition, and its effects are strongly connected to customers' willingness to buy. Substantial rebuttal of the Article 102(2) presumption is therefore not warranted. On the other hand, it cannot be denied that the defendant's sales efforts and continuing customer relationships played a major role in sales. It is consequently appropriate to rebut the presumption in A above by 30% and find the plaintiff's damage from the defendant's patent infringement to be 70% of the damage stated in A.

Intellectual Property High Court, 2016 (Ne) 10082 [Raw Seaweed Foreign-Matter Separation and Removal Apparatus] No grounds to rebut the Article 102(2) presumption; contribution rate 100%

Original Ameblo publication: 2023-09-06

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12819293124.html

Intellectual Property High Court, 2016 (Ne) 10082 [Raw Seaweed Foreign-Matter Separation and Removal Apparatus]

<Damages> No grounds to rebut the Article 102(2) presumption; contribution rate 100%

Even if the plaintiff is merely a manufacturer without personnel assigned to after-sales service, it cannot be said that, despite the invention's customer-attracting power, the plaintiff could not have had opportunities to sell to those customers.

<Contribution rate> <Grounds for rebutting the presumption>

Even if the plaintiff is merely a manufacturer without enough personnel to provide after-sales service like the defendant company, a distributor, it cannot be said that, despite the customer-attracting power of products embodying the invention, the plaintiff could not have had opportunities to sell to those customers. ⇒ Insufficient to rebut the presumption under Patent Act Article 102(2).

(Extract from the court's reasoning)

<Contribution rate>

Regarding the arguments concerning the inventions' contribution to sales, the inventions avoid co-rotation, prevent clearance clogging, and achieve efficient, continuous foreign-matter separation. They may be regarded as concerning a central structural part of the raw seaweed foreign-matter removal apparatus. Even if, as first-instance defendants Wanman and Seibu Kihan point out, conventional apparatuses passed a raw seaweed mixture through a clearance between a sorting casing (fixed ring) and a rotating disc to separate and remove foreign matter unable to pass through, those conventional devices clearly had the problems the inventions solve. This is inferred to have a strong influence on purchasing behavior. Considering this and the absence of allegations or proof concerning current sales of conventional devices, working the inventions appears indispensable to customers for such apparatuses.

Conversely, all grounds advanced by first-instance defendants Wanman and Seibu Kihan for reducing the inventions' contribution to the apparatus lack specificity.

Accordingly, it is inappropriate to reduce the inventions' contribution rate to sales of the apparatus and its components.

<Rebuttal grounds>

As to grounds for rebuttal, first-instance defendants Wanman and Seibu Kihan essentially argue only that, because the first-instance plaintiff is a manufacturer rather than a distributor, it cannot earn profits comparable to Wanman, which both manufactures and sells, or Seibu Kihan, which distributes. That asserted fact alone does not establish that, despite the customer-attracting power of products embodying the inventions, the plaintiff could not have had opportunities to sell to those customers. Nor are there any other special circumstances negating the loss of business opportunities.

The circumstances identified by Wanman and Seibu Kihan must therefore be regarded as insufficient to rebut the presumption under Article 102(2).

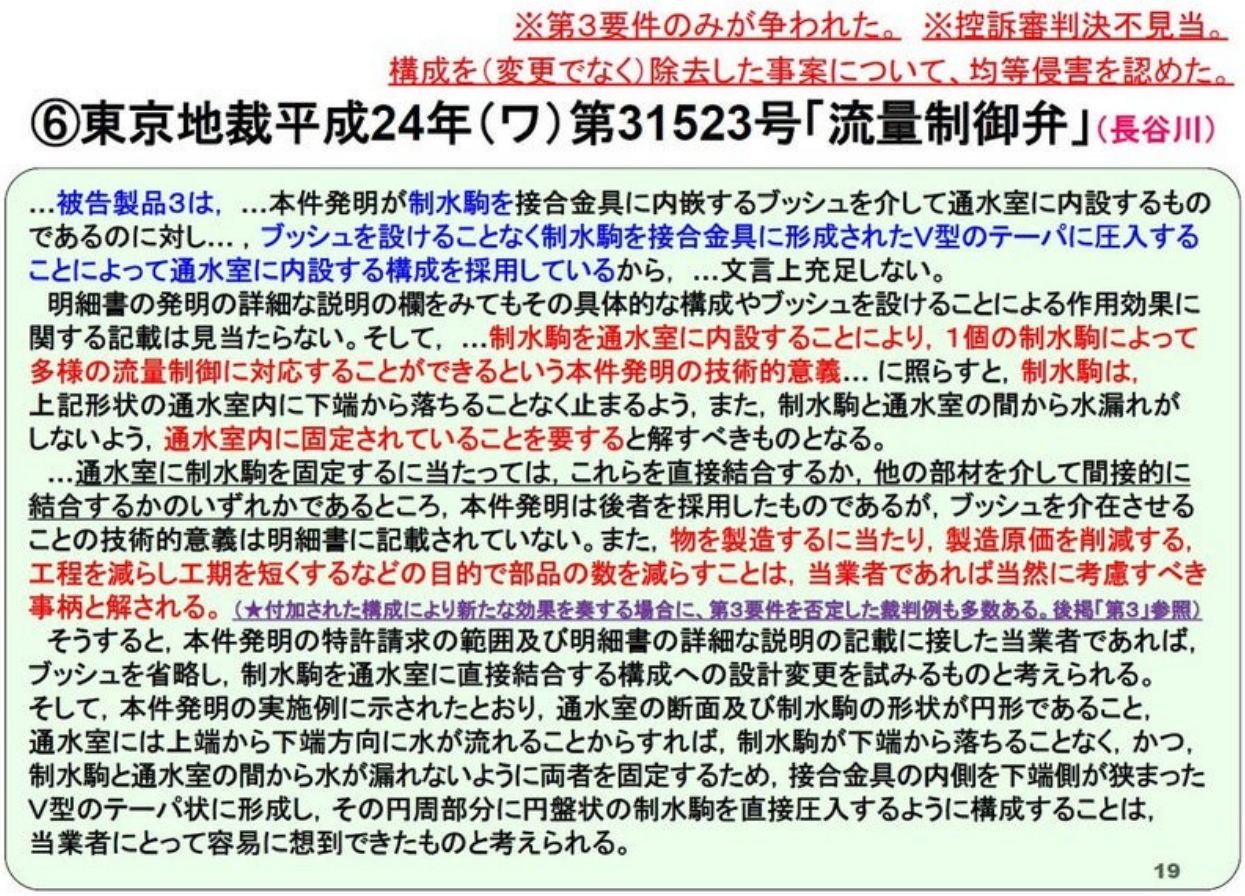
Osaka District Court, 2021 (Wa) 10032 [Chip-Type Fuse] <Takemiya>

Original Ameblo publication: 2023-09-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12819437709.html

Osaka District Court, 2021 (Wa) 10032 [Chip-Type Fuse] <Takemiya>

‘Even where an accused product lacks some claim elements of the patented invention, infringement by equivalence can arise if those elements are not essential parts ... and the other requirements are satisfied.’



⇒ Equivalence not established in this case

Cf. Tokyo District Court, 2012 (Wa) 31523 <Hasegawa>: equivalence established

(Extract from the court's reasoning)

Even where an accused product or process lacks some claim elements of the patented invention, infringement by equivalence can arise if those elements are not essential parts and the other requirements for equivalence are satisfied. The defendant argues that applying the doctrine of equivalents where some elements are missing impermissibly expands the claims. However, there is no rational reason to distinguish replacing some elements with other configurations from omitting some elements. ...

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-92171.pdf

English translation of the slide — Tokyo District Court, 2012 (Wa) 31523, “Flow control valve” <Hasegawa>

The author’s introductory notes: Only the third requirement of the doctrine of equivalents was disputed. The slide states that no appellate judgment was located. The court found infringement by equivalence in a case involving the removal, rather than alteration, of a component.

Quoted reasoning (English translation of the slide, checked against the official judgment):

“… Defendants’ product 3 … differs from the invention, in which the water-control insert is installed in the water-flow chamber through a bushing fitted inside the coupling. … Product 3 instead omits the bushing and installs the insert in the chamber by press-fitting it into a V-shaped taper formed in the coupling. It therefore … does not literally satisfy [Element D].

“… Even the detailed description of the invention contains no description of the bushing’s specific construction or of the operation and effects achieved by providing it. In view of … the invention’s technical significance—namely, that installing the water-control insert in the water-flow chamber enables a single insert to accommodate various flow-control requirements …—the insert must be secured within the chamber of the shape described above so that it cannot fall out through the lower end and water cannot leak between the insert and the chamber.

“… The insert can be secured in the chamber either by joining the two directly or by connecting them indirectly through another component. The invention adopts the latter approach, but the specification does not explain the technical significance of interposing a bushing. Moreover, when manufacturing an article, reducing the number of components to cut manufacturing costs, reduce process steps, or shorten production time is a matter that a person skilled in the art would naturally consider.

“Accordingly, a person skilled in the art who read the claims and detailed description of the invention would be expected to attempt a design change that omitted the bushing and joined the insert directly to the chamber. As shown in the embodiment, the chamber has a circular cross-section and the insert is circular, and water flows from the upper end of the chamber toward its lower end. It would therefore have been easy for a person skilled in the art to conceive of forming the inside of the coupling as a V-shaped taper narrowing toward the lower end and directly press-fitting the disk-shaped insert into that circular tapered portion, thereby securing the insert so that it would not fall out through the lower end and water would not leak between the insert and the chamber.”

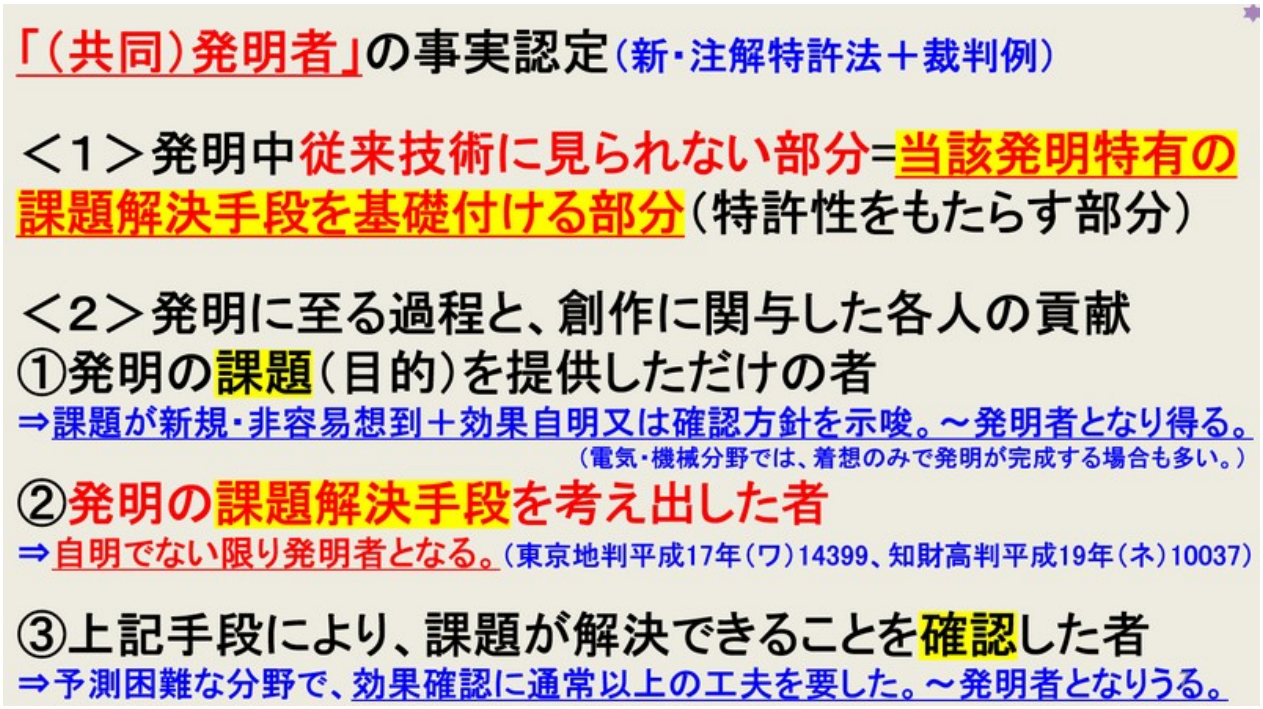
The author’s additional note on the slide: There are also many decisions finding that the third requirement is not satisfied where an added feature produces a new effect. The note refers to “Part 3” later in the source presentation.

Tokyo District Court, 2021 (Wa), 26762 [Hardener for Ground-Stabilization Chemical Solution] <Kokubu>

Original Ameblo publication: 2023-09-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12819564286.html

Tokyo District Court, 2021 (Wa) 26762 [Hardener for Ground-Stabilization Chemical Solution] <Kokubu>



‘The hardener invention ... is encompassed by the patented invention ... but there is no evidence that Bi and Ci ... contributed to the creative activity ... of conceiving the configurations corresponding to the differences and concretizing them to complete the patented invention.’

⇒ Unauthorized appropriation of the invention not established (prior user right established)

(Extract from the court's reasoning)

The hardener invention is encompassed by the patented invention in Elements B2, D, G, H, and I, and the two are recognized as differing in those respects. They therefore cannot be considered identical. ... There is insufficient evidence that Bi and Ci contributed to creative activity conceiving and concretizing the configurations corresponding to the differences to complete the patented invention. Nor does the evidence as a whole establish that they invented it. They therefore cannot be recognized as the inventors of the patented invention. ... The patent cannot be said to have been granted on an application filed by a person not entitled to the invention.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-92102.pdf

English translation of the diagram — Determining inventorship, including joint inventorship

The author’s framework, based on Shin Chūkai Tokkyohō (“New commentary on the Patent Act”) and case law:

1. Identify the part of the invention that is absent from the prior art: the part that underpins the invention’s distinctive means of solving the problem (the part that gives rise to patentability).

2. Examine the process leading to the invention and each person’s contribution to its creation.

(i) A person who merely provided the problem or objective of the invention: if the problem is novel and not readily conceivable, and the effect is self-evident or the person suggested how to verify it, that person may qualify as an inventor. In the electrical and mechanical fields, an invention can often be completed through conception alone.

(ii) A person who conceived the means of solving the problem: that person qualifies as an inventor provided those means are not self-evident. The slide cites Tokyo District Court, 2005 (Wa) 14399, and IP High Court, 2007 (Ne) 10037.

(iii) A person who confirmed that those means solve the problem: in a field where results are difficult to predict, that person may qualify as an inventor if verifying the effect required more than routine ingenuity.

<IP LAB> Attorney Hideki Takaishi's Patent Channel ①

Why Does ‘the Problem of the Invention at Issue’ Affect Inventive-Step Assessment?

This is the first video I made when I started YouTube three years ago. It explains Japanese courts' approach to inventive step, the most important patentability requirement. (Recently, the JPO has generally taken a similar approach.)

https://www.youtube.com/watch?v=jIR0ckvmv3c

https://www.takaishihideki.com/_files/ugd/324a18_a734b0f7356e4b72891f8a16f910c022.pdf

This article fills in what is left between the lines in that video and explains the subject more fully.

<Contents>

1. Japanese Examination Guidelines, case law before establishment of the IP High Court, and European and U.S. practice

2. Japanese case law: ‘the problem of the invention at issue’ affects inventive-step assessment

3. Why does ‘the problem of the invention at issue’ affect inventive-step assessment?

<Main text>

1. Japanese Examination Guidelines, case law before establishment of the IP High Court, and European and U.S. practice

(1) JPO Examination Guidelines (Japan)

The Examination Guidelines treat a common problem between the primary and secondary cited inventions as one factor in assessing motivation to combine. A difference in their problems may weigh against motivation and in favor of inventive step, but related technical fields, common functions or operations, suggestions in the references, and other relevant factors are also considered together.

However, the Guidelines also explain: ‘Where the problem to be solved by the claimed invention is novel and is not one that a person skilled in the art would ordinarily conceive, the problems to be solved by the claimed invention and the primary cited invention are usually substantially different. Accordingly, the fact that the claimed invention's problem is novel and not one ordinarily conceived by a person skilled in the art may be a circumstance favoring inventive step.’ They thus explain [i] that differences between the problems of the invention at issue and the primary cited invention can affect inventive-step assessment.

(2) Case law before establishment of the IP High Court (Japan)

Some commentators on pre-IP High Court case law say that many judgments rejected inventive step where, even though the problems of the invention at issue and the primary cited invention differed, a skilled person at the priority date could readily combine the primary and secondary cited inventions using another problem or other consideration as a starting point. The Tokyo High Court's 2003 Sewing Machine judgment [ii] is sometimes cited as an example.

A close reading, however, shows that even the Sewing Machine judgment stated: ‘Where two inventions differ in configuration, it may be found that the configuration corresponding to the difference is not easily conceivable because the purpose of providing the configuration common to both differs; even then, the

difference in purpose does not itself become a difference between the inventions.' It thus held that different 'purposes' of the invention at issue and the primary cited invention could affect obviousness. Since 'purpose' and 'problem' here have essentially the same meaning, it too recognized that the invention's problem could matter.

Of course, based on my own detailed review of patent cases dating back to the Showa era, I perceive an increase around the establishment of the IP High Court—more precisely, from around 2010—in pro-patent inventive-step judgments emphasizing and specifically identifying the invention's problem. However, I consider this a change in the tendencies of problem identification and obviousness assessment themselves, not a change in the legal test as to whether 'the problem of the invention at issue' is a factor in inventive-step assessment.

(3) Current U.S. practice

Under current U.S. practice, even if the invention's 'problem' differs from the primary reference's problem, the invention is deemed obvious if the primary and secondary references can be combined for a problem different from the invention's own. This differs from Japanese practice. Explaining this distinction consciously when Japanese clients enter the U.S. phase, or when U.S. counsel requests Japanese entry, helps prosecution proceed smoothly and appropriately.

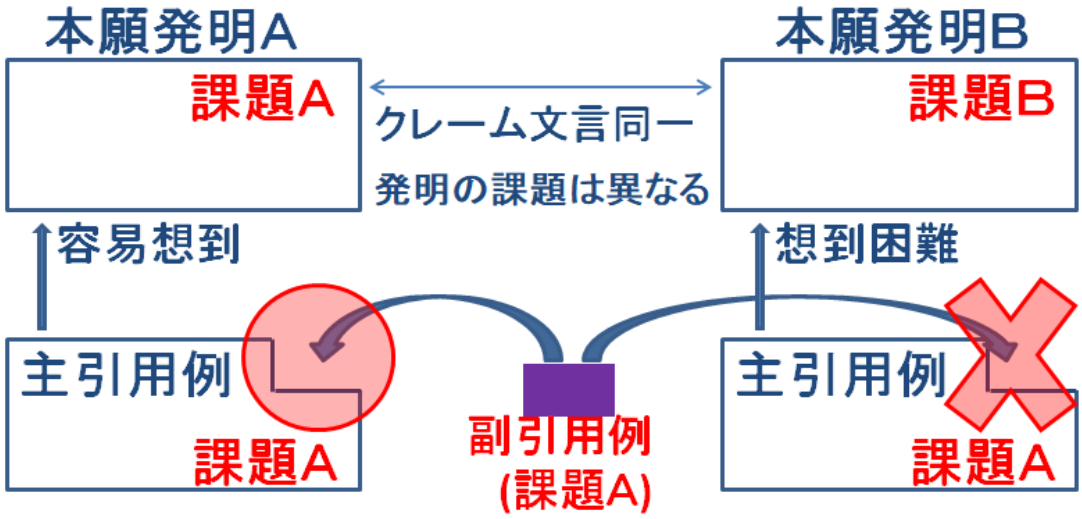
(4) Current European practice

The European Examination Guidelines (GL G-VII 5.2) adopt the 'problem-and-solution approach.' They state that, after identifying the closest prior art (CPA), obviousness is assessed by: a) identifying the distinguishing features over the CPA; b) identifying the technical effects of those features; and c) formulating the technical problem. They expressly note that the objective technical problem derived in this manner may differ from the 'problem' presented by the applicant in its application.

Thus, the European Guidelines differ somewhat from Japanese practice in determining the 'objective technical problem' to be solved by comparison with the prior art without being bound by the specification's wording. They are, however, the same as Japanese practice in that 'the problem of the invention at issue' affects inventive-step assessment.

French courts are said to have an approach close to the EPO. In a French judgment in a case with which I am actually involved, one of two asserted primary references was rejected because it was not the closest prior art (CPA). European strategy therefore must take account of differences from Japanese practice. For example, in Japan it is sometimes effective to use as the primary reference a known invention with many structural differences but the same problem. In Europe, strategy must account for a possible objection that it is not the CPA.

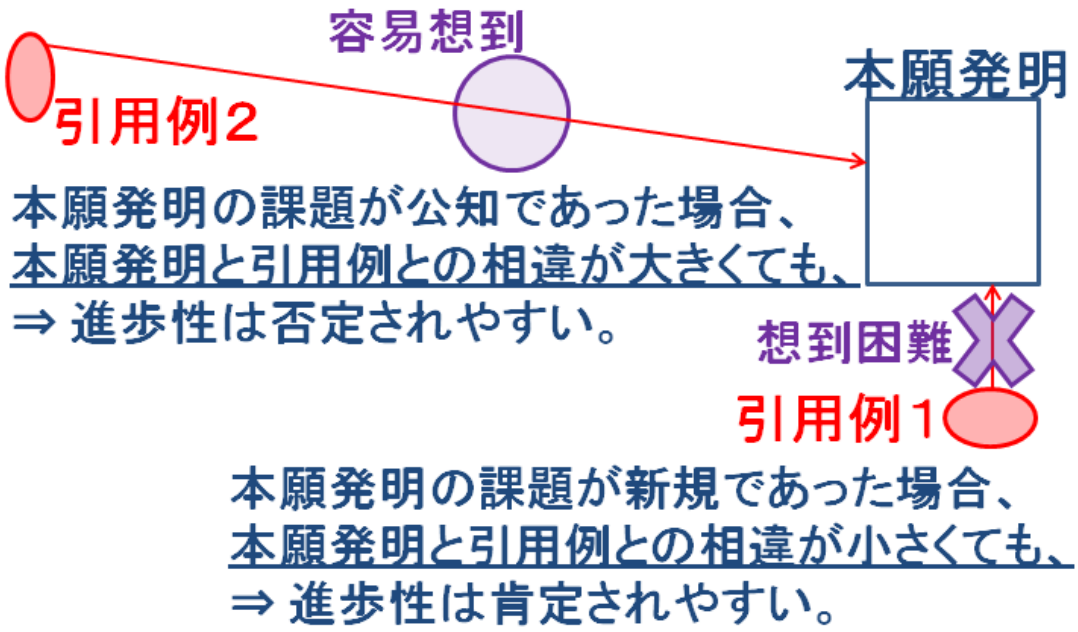
2. Japanese case law: 'the problem of the invention at issue' affects inventive-step assessment



Since around 2008, inventive-step assessment has tended to emphasize differences between the problems of the invention at issue and the cited invention as a factor negating motivation to combine, and many cases identify the invention's 'problem' specifically[iii]. This tendency is, of course, an important factor favoring inventive step, but it is not the principal subject of this article and will not be explored further here.

That 'the problem of the invention at issue' affects inventive-step assessment in Japanese case law is illustrated, for example, by the IP High Court's 2011 Ventilation Fan Filter judgment [iv]. It held: 'Whether an invention could readily have been conceived is a comprehensive assessment. To find an invention easily conceivable, it is not enough merely that "adopting a particular configuration to solve the problem was easy"; it may also be necessary that "setting the problem to be solved was easy." In other words, even if adopting a particular configuration to solve the problem was easy, where "the setting of or focus on the problem was unique" (for example, where a problem not ordinarily conceived was identified), the invention cannot automatically be said to have been easily conceivable.'

Among recent judgments, the IP High Court's X-Ray Fluoroscopic Imaging Apparatus judgment [v] held: ‘It is entirely possible to evaluate the claimed invention as significant in newly identifying, from the operator's perspective, a problem concerning facilitating image adjustment. ... It cannot be said that, assuming the existence of that problem, ... there is motivation to adopt the configuration corresponding to the difference. ...’



Figures 1 and 2 below illustrate this schematically. Even where the prior art is close to the claimed invention (there are few differences), inventive step is more readily affirmed if the invention's problem is novel. To understand this consistently with the JPO Examination Guidelines, one can view a problem different from the prior art's as producing a ‘qualitatively different effect’ through its solution. This makes the understanding more coherent.

Conversely, even where the prior art is distant from the claimed invention (there are many differences), inventive step is more readily denied if the problem is known. By analogy with climbing a mountain, climbing a cliff from the ninth station is harder than following a mountain path from the foot. Thus, even with the same inventive configuration (identical claim wording), there is room for ingenuity in describing the ‘problem.’ When filing a patent application, it may therefore be necessary to reconsider working-example data from new perspectives.

<Figure 1: Even with identical claim wording, the invention's problem may affect the inventive-step determination.>

Figure 1 — translation of labels: Claimed Invention A / Claimed Invention B; Problem A / Problem B; identical claim wording; the problems of the inventions differ; obvious / not obvious; primary reference; secondary reference (Problem A).

<Figure 2: Prioritize as the primary reference an invention sharing the same problem over one with fewer differences.>

Figure 2 — translation of labels: Reference 2; obvious; claimed invention; Reference 1; not obvious. If the problem addressed by the claimed invention was already known, inventive step tends to be denied even when the differences between the claimed invention and the reference are substantial. If the problem addressed by the claimed invention was new, inventive step tends to be recognized even when the differences are small.

In summary, identifying the invention's ‘problem’ abstractly at a higher level of generality (a lower level of demand) tends toward denying inventive step, whereas identifying it concretely at a lower level of generality (a higher level of demand) tends toward affirming it. (This tendency is the reverse of the support requirement. For support, an abstract, less demanding problem may suffice even without high-level working examples or disclosure of a mechanism. Conversely, a concrete, more demanding problem raises the issue whether disclosure allows the skilled person to understand that the problem can be solved at that level, making support harder to satisfy. These interrelationships among patent-law issues complicate practice while leaving substantial room for ingenuity in the original specification even for exactly the same invention.)

When acting for a petitioner seeking invalidation for lack of inventive step, it is often more effective to use as the primary reference prior art sharing the invention's problem, even if it has many differences, and fill the differences with a secondary reference, rather than choosing prior art with few differences—provided the issue of ‘obviousness upon obviousness’ does not arise[vi]. Therefore, where combining two prior-art teachings leads to the invention, the ease of combination is at issue, but the conclusion may change depending on which is the primary reference[vii]. Arguing both directions of the combination is therefore worth considering in practice[viii].

3. Why does ‘the problem of the invention at issue’ affect inventive-step assessment?

(1) If an invention is understood as a ‘configuration,’ then even if the primary cited invention's problem differs from the invention's problem, shared problems between the primary and secondary references should lead to a finding of lack of inventive step whenever at least the invention's ‘configuration’ is easily conceivable. Thus, while similarities and differences between the primary and secondary references' problems would matter, similarities and differences between the invention's problem and that of the primary (or secondary) reference should not affect inventive-step assessment.

On this point, the courts' view is that an invention is a ‘technical idea (a technical problem and the means for solving it)’[ix]. When deciding whether one could arrive from the references at the ‘technical idea’ constituting the invention, the issue is whether the invention's problem can be solved. The predominant case law therefore treats similarities and differences between the invention's problem and that of the primary (or secondary) reference as affecting inventive-step assessment.

This article attempts to construct a rationale that reasonably explains this case-law trend, putting aside whether it is desirable.

(2) Patent Act Article 2(1) provides: ‘In this Act, “invention” means a highly advanced creation of technical ideas utilizing the laws of nature.’ Paragraph (2) provides: ‘In this Act, “patented invention” means an invention for which a patent has been granted.’ An invention possessing inventive step is therefore a ‘technical idea.’

The term ‘technical idea’ appears nowhere else in the Patent Act outside Article 2. Considering its ordinary meaning, in light of the description in the Industry–Academia Collaboration Keyword Dictionary, technology can be understood as concrete means for achieving a specified purpose that can be used in practice and transmitted as knowledge. Also, the Seisenban Nihon Kokugo Daijiten (Selected Edition of the Great Dictionary of the Japanese Language) defines ‘idea’ as ‘the content of what is thought ... the meaning understood within logical structures such as sentences and inferences.’ Redefined in patent terminology, a ‘technical idea’ can therefore be understood as ‘the thought content of concrete means for achieving the invention's problem-solving objective.’

Thus, an ‘invention’ under Japanese patent law can be understood as including not only the configuration (for a product invention) or steps (for a method invention) that are the concrete means of achieving the problem-solving objective, but also the ‘problem of the invention’ itself. This is why an IP High Court judgment expressly describes an ‘invention’ as a ‘technical idea (a technical problem and the means for solving it)’[x].

For example, in Japan, a ‘use invention’ (‘an invention based on (i) discovering an unknown attribute of a product and (ii) finding that the attribute makes the product suitable for a new use’) may have novelty and inventive step because its ‘use’ is an invention-defining feature, even when the product itself is known. As one instance, case law has recognized novelty and inventive step through limiting the patient population, for example by disease progression, even with the same active ingredient for the same disease[xi]. Thus, because novelty and inventive step may be recognized in Japan even where the configuration as a product is identical to the prior art, it is accepted in practice as a fundamental premise that an ‘invention’ under Japanese patent law is not confined to the configuration constituting concrete means for solving its problem.

As stated above, current U.S. practice finds an invention obvious even if its problem differs from the primary reference's, provided the primary and secondary references can be combined for a different problem. This is consistent with the U.S. patent-practice view that an ‘invention’ is a configuration and that intended use does not constitute an invention-defining feature for a product invention.

(Note) MPEP 2111.02 states that "The determination of whether a preamble limits a claim is made on a case-by-case basis in light of the facts in each case". For a statement of the purpose or intended use of the claimed invention, it requires an evaluation of whether the statement results in a structural difference (or, for process claims, a manipulative difference) between the claimed invention and the prior art, and states: "If so, the recitation serves to limit the claim." https://www.uspto.gov/web/offices/pac/mpep/s2111.html

Moreover, the Supreme Court's 2019 Topical Ophthalmic Formulations judgment [xii] held that, even where an earlier judgment finding both the configuration and use of a use invention easily conceivable had become final and binding, inventive step could still be recognized if there were ‘unforeseeable remarkable effects’[xiii]. On remand, the IP High Court found such effects and upheld inventive step[xiv]. Japan thus

goes beyond the use inventions described above, where the defining feature of use differs: even where an earlier judgment determining that all invention-defining features, including ‘use,’ were easily conceivable by the skilled person at the priority date [xv] has become final, inventive step may still be recognized depending on the invention's effects[xvi].

Patent Act Article 29(2) provides: ‘Where, before the patent application, a person with ordinary knowledge in the technical field to which the invention pertains could easily have made the invention based on inventions listed in the items of the preceding paragraph, a patent may not be granted for that invention notwithstanding that paragraph.’ Thus, if inventive step can be recognized depending on effects (= the invention could not ‘easily have been made’) even though the invention-defining features, including use, were easily conceivable at the priority date, ‘invention’ must encompass not only those features but at least its ‘effects’ as well.

The Supreme Court's Topical Ophthalmic Formulations judgment shows that it too proceeds on the fundamental premise that an ‘invention’ under Japanese patent law is not confined to the configuration constituting concrete means for solving the problem. Effects are the reverse side of a problem[xvii] (although it should be noted that the reverse side of an effect is not necessarily a problem: different problems may be solved to produce the same effect, so there is no one-to-one correspondence). Moreover, considering the invention's problem and effects when assessing whether its defining features were easily conceivable presents a relatively lower hurdle than recognizing inventive step from effects where those features were easily conceivable. The Supreme Court can therefore be understood as also presupposing this Japanese practice.

Accordingly, in light of the statutory text and the Supreme Court's Topical Ophthalmic Formulations judgment, an ‘invention’ may be understood not merely as configurations, steps, or invention-defining features, but as the concept comprising those together with the invention's problem and effects. This understanding accords with the majority of lower-court decisions and provides a coherent explanation of inventive-step assessment. It also more reasonably explains why the invention's problem affects support, addition of new matter, and other patent-law issues.

[viii] IP High Court, January 17, 2017, Hanrei Times No. 1440, p. 137 / 2016 (Gyo-Ke) No. 10087, Surface Decoration Structure of an Article <Presiding Judge Takabe>, decided the issue in an action to revoke a JPO trial decision where both parties sought an assessment switching the primary and secondary references considered in that decision. Conversely, without both parties' agreement, an invalidity ground alleging lack of inventive step by switching the primary and secondary references cannot be raised in such an action because the subject matter of the litigation differs.

(Note) The official case summary of this judgment states (in translation): "This judgment held that, in this case, where Cited Inventions 1 to 3 were publicly known facts examined in the trial as inventions falling under Article 29(1)(iii) of the Patent Act, both parties accepted that the alternative argument be examined and determined in this action and did not wish it to go through examination and determination at the JPO, and the parties' arguments and evidence on that point had been fully presented, examining and determining the alternative argument was also permissible from the viewpoint of resolving the dispute in a single proceeding." The judgment thus cited, as reasons for permitting examination of the argument with the primary and secondary references switched, that the prior-art facts had been examined in the trial, that both parties accepted examination and determination in this action and did not wish it to go through the JPO, that the parties' arguments and evidence on that point had been fully presented, and the viewpoint of resolving the dispute in a single proceeding. https://www.courts.go.jp/assets/hanrei/hanrei-point_pdf-86435.pdf

[xv] IP High Court, July 30, 2014, Courts website / 2013 (Gyo-Ke) No. 10058 <Presiding Judge Tomita>

[xvi] The view that inventive step may be recognized depending on effects even where the invention-defining features are easily conceivable is called the independent-requirement theory. For example, Tokyo High Court, March 28, 2002, Courts website / 2000 (Gyo-Ke) No. 312, Baked Confectionery, held: ‘Effects that justify patentability for an invention whose configuration itself is found easily conceivable must be difficult to predict or discover for that configuration and, on that premise, would have to be exceptionally remarkable compared with the effects predicted or discovered for it.’ Tokyo High Court, December 25, 2003, Courts website / 2001 (Gyo-Ke) No. 499, Method for Producing Concrete Products, was to the same effect. These decisions indeed develop their general reasoning on the independent-requirement theory, but may also be understood as mere lip service while denying inventive step. One of the few cases actually recognizing inventive step under that theory is IP High Court, July 24, 2013, Courts website / 2012 (Gyo-Ke) No. 10207, Acid Addition Salts of Optically Active Piperidine Derivatives and Processes for Their Preparation <Presiding Judge Shitara>. (See Hideki Takaishi, ‘The Significance of “Qualitatively Different Effects” in Inventive-Step Assessment: An Integrated Understanding of “Problems” and “Qualitatively Different Effects” in the Obviousness Inquiry,’ Patent, Vol. 69, No. 5 [Supplement No. 15], 2016.)

Intellectual Property High Court, 2010 (Gyo-Ke) 10407 [Method for Operating a Wind Park] <Iimura>

Original Ameblo publication: 2023-09-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12821507010.html

Intellectual Property High Court, 2010 (Gyo-Ke) 10407 [Method for Operating a Wind Park] <Iimura>

For an electrical invention, a function (= setting at 0–100% of rated output power) was incorporated into the claim; treating this as a difference, novelty and inventive step were upheld.

'The cited invention and the claimed invention differ in their problems to be solved ... and their means for solving them.' ⇒ A teaching away exists

(Extract from the court's reasoning)

In the invention disclosed in Reference 1, the purpose of adjusting individual wind-power installations within a range of 0 to 100% of their rated output power is to set the output power of the entire wind-power facility at the maximum permissible transmission capacity of the grid according to the grid voltage, not to make the output power of the entire wind-power facility lower than the grid's maximum permissible transmission capacity. In the invention disclosed in Reference 1, moreover, the maximum output power of the wind-power facility, obtained by adding the rated output power of the individual wind-power installations, exceeds the grid's maximum permissible transmission capacity. Therefore, setting the output power of the entire wind-power facility at 100% of rated output power would exceed that maximum permissible transmission capacity, and a setting producing output power exceeding the grid's maximum permissible transmission capacity in this way is not contemplated either. Accordingly, Reference 1 cannot be said to substantially disclose 'setting the output power of the entire wind-power facility at a desired value within a range of 0 to 100% (of its rated output power) according to the grid voltage.' ... The cited invention and the claimed invention differ in the problems to be solved. ... They differ in the means for solving those problems. ... There is a teaching away from combining the configuration relating to Difference 2 with the cited invention ... .

Original Ameblo publication: 2023-09-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12821732714.html

Intellectual Property High Court, 2009 (Gyo-Ke) 10153 [Method for Making a Cutting-Tool Insert ...] <Nakano>

* A case holding that the drawings in the cited reference did not disclose the claimed method invention

‘Figures 3 to 5 ... of the cited document ... do not describe a sequence of steps of providing a retaining member having geometrical features ... and joining that provided retaining member ... to a cutting body.’

(Extract from the court's reasoning)

Figures 3 to 5 ... of the cited document illustrate the recesses formed in the hard metal, and it is stated that a desired cross-sectional shape can be selected for those recesses ... . With respect to a method of forming a cutting tool for a lathe, the cited document ... describes the formation of geometrical features comprising grooves, dovetails, etc. in the cutting body, and the close fixation of hard metal to a retaining member by die-casting, pressing, molding, or casting. However, it cannot be said to describe that geometrical features comprising grooves, dovetails, etc. are formed in the retaining portion before the hard metal is fixed to that portion by casting or the like ... . Accordingly, the cited document cannot be said to describe a sequence of steps of providing a retaining member having geometrical features ... and joining that provided retaining member to a cutting body through those geometrical features.

Intellectual Property High Court, 2007 (Gyo-Ke) 10241 [Exhaust Valve for a Storage Bag]

* A case in which a configuration could not be read from the drawings in the cited reference

‘... It is not impossible to see the lid body 2 as being rotated approximately three times, but ... drawings attached to an application ... are not necessarily as detailed or accurate as engineering drawings. Therefore, the mere fact that the depicted relative positions of the threaded portion 11 and threaded portion 21 in Figures 1 to 3 of Exhibit Ko 1 appear as described above ... does not permit limiting the invention in Ko 1 to one in which the lid body 2 is rotated “several turns” ... .’

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-36376.pdf

Intellectual Property High Court, 2005 (Gyo-Ke) 10677 [Memory Control Device] <Mimura>

Original Ameblo publication: 2023-09-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12821865301.html

Intellectual Property High Court, 2005 (Gyo-Ke) 10677 [Memory Control Device] <Mimura>

* Motivation to adopt technology older than the cited invention was denied

⇒ Inventive step upheld

‘The cited invention ... takes the limitations on the access unit in the ... system as its premise and has ... as its objective ... . Therefore ... it does not provide an occasion to change to page mode, departing from that specific premise.’

(Extract from the court's reasoning)

The cited invention takes as its premise the limitations on the access unit in the nibble-mode access system and has as its objective enabling support for both nibble-mode and normal-mode access. Therefore, the mere facts that nibble-mode access and page-mode access are generally known as high-speed memory-access systems, or that page-mode access is known to be an older technology, do not provide an occasion for a person skilled in the art encountering the cited invention to depart from its specific premise and change the particular nibble-mode access system adopted there to page mode.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-33477.pdf

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12822005883.html

Intellectual Property High Court, 2009 (Gyo-Ke) 10142 [Apparatus for Mixing Powder and Granules and Removing Fine Powder ...] <Nakano>

* Identity of technical field alone does not establish obviousness; motivation is required

* Outcomes differed by claim

‘Even if the technical fields or technical content are identical or closely related, or the purposes and functions are similar ... there may be countless technologies that can be combined ... circumstances linking them, for example a common problem and motivation based on it, are required.’

(Extract from the court's reasoning)

Even if the technical fields or technical content are identical or closely related, or the purposes and functions are similar, there may be countless technologies capable of being combined, and it goes without saying that not every such combination can be called obvious. In that sense, for a combination of technologies having a certain relationship, etc. as described above to be obvious to a person skilled in the art (a person having ordinary knowledge in the technical field to which the invention belongs), circumstances linking them, for example a common problem and motivation based on it, are necessary, and these are absent in this case ... .

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-80063.pdf

Intellectual Property High Court, 2011 (Gyo-Ke) 10193 [Chair-Type Massage Machine] <Shiotsuki>

Original Ameblo publication: 2023-09-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12822140937.html

Intellectual Property High Court, 2011 (Gyo-Ke) 10193 [Chair-Type Massage Machine] <Shiotsuki>

‘It arises generally and is not a problem peculiar to Ko 2 ... through Ko 4 ... . For a person skilled in the art ... to minimize the projection amount when moving ... the treatment elements ... in order to solve the above general problem ... is a measure that may be taken as appropriate, even without any suggestion, etc. in the Ko 1 publication itself.’

(Extract from the court's reasoning)

... In the technical field of massage machines, ... problems such as danger to the user's body or a large load on the drive device when treatment elements are moved with a large amount of projection arise generally from moving treatment elements along the human body; they are not problems peculiar to cases in which the treatment elements are provided in the backrest, etc., as in the massage machines disclosed in the Ko 2 through Ko 4 publications. ... When a person skilled in the art encounters the Ko 1 invention, which provides moving treatment elements for the legs, that person may recognize the above general problems concerning movement of the treatment elements and, to solve them, apply well-known technical matters to the Ko 1 invention. It should be said that, even without any suggestion, etc. in the Ko 1 publication itself, that person may appropriately minimize the projection amount, namely put the elements into a non-projecting state, or appropriately adjust that amount downward when the control circuit moves the treatment elements (together with the leg-support platform) in response to input such as operation of a switch.

Intellectual Property High Court, 2011 (Gyo-Ke) 10364 [... Electric Motor with High Specific Output]

Original Ameblo publication: 2023-09-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12822408137.html

Intellectual Property High Court, 2011 (Gyo-Ke) 10364 [... Electric Motor with High Specific Output]

* Enablement of an invention comprising multiple components should be examined component by component (Shojihomu, Analysis of Judgments Rescinding Patent Trial Decisions, p. 91)

* In this case, enablement was upheld despite some lack of clarity in the explanation of effects and in matters outside the claimed invention’s components.

* Enablement upheld although no upper limit was specified

* Enablement of the claimed invention, which comprises multiple components, should be examined for each component constituting the claimed invention. (* Analysis in Shojihomu, Analysis of Judgments Rescinding Patent Trial Decisions, p. 91.)

(Extract from the court's reasoning)

[Claim] A fluid-cooled electric motor comprising a motor housing made of a polymer material and containing a stator ... characterized by containing a thermally conductive, electrically insulating filler in an amount of at least 40% by weight

The claimed invention ... is a product invention, but it is an electric motor having the configuration recited in its claims (Section 2.2 above). Therefore, for the claimed invention to be enabled, it must be said that the detailed description of the invention in the application specification must specifically describe methods for producing the components constituting the claimed invention, or, even without such a description, a person skilled in the art must be able to produce those components on the basis of the specification and common general technical knowledge at the filing date.

... Paragraph [0006] of the application specification merely refers to the effects of the claimed invention and does not refer to a method of carrying it out. Therefore, even if that passage is unclear, this does not make it impossible for a person skilled in the art to produce the ‘polymer material’ and related components, which, among the components constituting the claimed invention, are particularly related to that passage. ...

... The defendant argues that the configuration of the claimed invention includes cases where the filler content is nearly 100% by weight, with the result that a person skilled in the art cannot readily implement a way of forming the motor housing. However, according to the description ... and Figure 1 of the application specification, it is clear that the ‘motor housing’ of the claimed invention is a structural component equipped with a pump, an electric micromotor, etc. It must be regarded as an obvious premise that it has sufficient strength, etc. to be usable as a ‘fluid-cooled electric motor with high specific output.’ As for the ‘polymer material’ constituting the motor housing, imagining the use of a material containing nearly 100% filler by weight and almost no duromer, its principal component, is itself an unreasonable premise. Accordingly, the defendant's argument cannot be accepted because it is inherently unreasonable.

The defendant also argues that, because the properties of the duromer (liquid epoxy resin) serving as the ‘polymer material’ of the claimed invention and the thermal conductivity of the filler (fine Al2O3 powder) are not uniquely determined, the effects of the claimed invention cannot be inferred; not only is the reason (criticality) why thermal conductivity markedly increases when duromer is contained in an amount of at least 40% by weight unclear, but the liquid epoxy resin and fine Al2O3 powder are also not specified sufficiently concretely for a person skilled in the art to carry out the invention. However, the existence of

effects and the technical significance of the weight ratio of duromer are each merely one of the factors that may be considered in assessing the obviousness of the claimed invention and do not directly relate to enablement. Moreover, the above liquid epoxy resin and fine Al2O3 powder are both readily obtainable as commercial products ... . Therefore, the absence of details of those materials in the application specification does not prevent a person skilled in the art from carrying out the claimed invention.

Paragraph [0014] of the application specification ... is somewhat unclear as Japanese ... and it would be desirable to amend it to make it clearer. However, ... neither the above ‘bearing’ nor the ‘shaft seal’ is a component constituting the claimed invention. Thus, even though the quoted passage is somewhat unclear as stated above, this does not make it impossible for a person skilled in the art to carry out the claimed invention. ...

Intellectual Property High Court, 2021 (Gyo-Ke) 10053 [Method for Making a Container for Microwave-Heated Food] <Otaka>

Original Ameblo publication: 2023-09-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12822614181.html

Intellectual Property High Court, 2021 (Gyo-Ke) 10053 [Method for Making a Container for Microwave-Heated Food] <Otaka>

‘... In a container for microwave-heated food, the shape and extent of holes provided to release steam generated during heating are design matters that a person skilled in the art selects as appropriate, taking the amount of steam discharged into account.’

⇒ Inventive step denied

(Extract from the court's reasoning)

Reference 1 neither describes nor suggests limiting the shape of the ‘small holes’ provided in the lid of a container holding instant food to a particular shape, and neither describes nor suggests a specific method of forming those ‘small holes.’ ... In a container for microwave-heated food, the shape and extent of holes provided to release steam generated during heating are design matters that a person skilled in the art selects as appropriate, taking the amount of steam discharged into account. The opening area of each ‘small hole’ (opening 9) in the instant-food container of Example 1 described in Reference 1 is approximately 8.03 mm², and the total opening area is approximately 64.24 mm² (8.03 mm² × 8). ... In light of these matters, a person skilled in the art encountering References 1 and 5 would be motivated, in order to discharge to the outside the steam generated from the food contained in the instant-food container of Example 1 of Reference 1, to make the eight circular ‘small holes’ in the lid ‘elongated holes’ and, to form them, adopt the processing method disclosed in Reference 5, which uses laser irradiation to process a plastic structure to form through-holes no more than 200 μm wide, and attempt to set the width of those ‘elongated holes’ at no more than 200 μm (no more than 0.2 mm) so that their total opening area is approximately 64.24 mm². It is therefore found that that person could readily conceive of configuring the above ‘small holes’ as ‘an exhaust portion comprising a group of elongated exhaust holes formed by boring multiple elongated exhaust holes’ within the numerical range of ‘0.15–1.0 mm in width.’

2011 (Wa) 3292 [Battery-Powered Alarm] (Damages) <Osuga>

<Circumstances rebutting the presumption>

Proviso to Article 102(1): circumstances under which the plaintiff would have been unable to sell its products

It is appropriate to find that the proportions considered to have been substituted by other companies' competing products and the proportions considered to have been sold owing to the defendant's own sales capabilities, characteristics of the defendant's products other than the portions implementing the invention at issue, etc., taken together, constitute ‘circumstances under which [the plaintiff] would have been unable to sell’ its products. In light of the above circumstances, it is appropriate to regard the above quantity as 70%.

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12822827625.html

Intellectual Property High Court, 2013 (Ne) 10017 and 2013 (Ne) 10041 [Open-Type Fermentation Treatment Apparatus]

<Proviso to Article 102(1)>

The only characteristic portion of the invention at issue is the ‘V-shaped scooping member’

Only a few of the numerous paddles

Minimal cost

The defendant’s pamphlet, the plaintiff’s website, and the product catalog do not present the adoption of a scooping member that prevents the accumulated material from spreading as a product feature.

<Grounds for rebutting the presumption> Proviso to Article 102(1): circumstances under which the plaintiff would have been unable to sell its products

The invention at issue is an improvement invention; the only characteristic portion forming the basis of the invention is the ‘V-shaped scooping member.’ The other configuration of the open-type fermentation apparatus lacks inventive step.

The ‘V-shaped scooping member’ is used only for one to a few paddles from the outer end of the rotary shaft located on the elongated open-side-face side, among the paddles comprising numerous long rods.

The cost of the ‘V-shaped scooping member’ is negligible compared with the cost of the open-type fermentation apparatus.

The defendant’s pamphlet, the plaintiff’s website, and the product catalog do not present the adoption of a scooping member that prevents the accumulated material from spreading as a product feature, and it cannot be said that the member’s shape made a major contribution to consumers’ motivation to purchase.

The ‘V-shaped scooping member’ is technically important.

The designs of the respective companies suggest that adoption of the shape of the ‘V-shaped scooping member’ was an essential improvement accompanying adoption of an open-type fermentation tank.

(Extract from the court's reasoning)

Grounds for rebuttal

Corrected Invention 2 at issue is an improvement invention over Invention 1 at issue, and the characteristic portion forming the basis of the invention is the V-shaped scooping member. As for the other configuration of the open-type fermentation apparatus, since Invention 1 at issue is invalid for lack of inventive step in comparison with the KS7-12 invention, as stated above, it does not possess inventive step. These circumstances should be considered as ‘circumstances under which sales could not have been made’ under the proviso to Article 102(1) of the Patent Act.

The configuration of Corrected Invention 2 other than the configuration relating to the V-shaped scooping member does not possess inventive step, and the characteristic portion forming the basis of the invention is confined to that scooping member. Furthermore, that scooping member is used only for at least one to a few paddles from the outer end of the rotary shaft located on the elongated open-side-face side, among the paddles comprising numerous long rods arranged axially around the peripheral surface of the rotary shaft. It

is also clear that the cost associated with the scooping member is negligible compared with the cost of the open-type fermentation apparatus. The defendant's pamphlet (Ko 5), plaintiff Nikkan Engineering's website (Otsu 12-1 to 12-3 and 68), and the product catalog (Ko 15) contain no description indicating as a feature the adoption of a scooping member capable of preventing the accumulated material from spreading toward the elongated open side face; it cannot be said that the shape of the scooping member made a major contribution to consumers' motivation to purchase.

However, as stated above, Corrected Invention 2 has the effect of preventing the accumulated material from spreading, collapsing, etc. when scooped outward, thereby eliminating inconveniences such as compost reaching the wheel tracks of the carriage traveling on the floor and obstructing smooth travel, and the need for the troublesome task of manually scooping up the material that has collapsed and spread outward with a shovel, etc. and piling it on the top surface of the accumulated material. As a configuration for this purpose, the V-shaped scooping member of Corrected Invention 2 was adopted for at least one to a few paddles from the outer end of the rotary shaft located on the elongated open-side-face side. The open-type fermentation apparatus does not adopt a pit-type fermentation tank with parallel elongated walls between which material to be treated is placed and accumulated; instead, one side is an elongated wall and the other is an elongated open side face. It is therefore inevitable that the accumulated material spreads toward the elongated open side face as the agitator reciprocates. In light of this, the V-shaped scooping member of Corrected Invention 2 is important as a configuration for preventing this. Indeed, according to the evidence cited below and the entire purport of the oral argument, the ‘Open-Type KS5-H1200 Mixer’ (the mixer at issue), manufactured by plaintiff Nikkan Engineering, sold to Ebara Corporation, and delivered and installed by that company at the ‘Compost Center’ located in [location omitted in source], underwent a post-delivery test run around March, 2000, but shortly thereafter, on May 8 of that year, its parts were replaced free of charge with triangular claws (V-shaped scooping members) (Ko 12-7; Otsu 15 and 16). Of the Type B apparatuses sold by the defendant to Suzuki Construction, the unit delivered to Masuda Farm likewise had its members replaced free of charge with scooping members 105d within two months of delivery, and when a unit was subsequently delivered to Oki Farm, scooping members 105d were fitted from the outset (Ko 6 and 7; Otsu 66). Embodiments of Patent 2 were not limited to the three units previously found to have been manufactured by plaintiff Nikkan Engineering under the contractually exclusive non-exclusive license at issue (License 2): V-shaped scooping members were also used in open-type fermentation apparatuses delivered and installed at ‘Eco Max Sendai,’ a compost manufacturing facility located in [location omitted in source], the ‘Oe Asahi Compost Center’ located in [location omitted in source], the ‘Namie Town Joint Organic Compost Center’ located in [location omitted in source], the ‘Sakegawa Village Compost Center’ located in [location omitted in source], and the ‘Nakayoshi Yuki Center’ located in [location omitted in source] (Ko 32–38, 57 and 61). Taking these matters together with the motivation and circumstances of development of Corrected Invention 2 described in Corrected Specification 2, it can be inferred that adoption of the V-shaped scooping member of Corrected Invention 2 was an essential improvement accompanying adoption of an open-type fermentation tank.

Considering the foregoing circumstances comprehensively, it is appropriate to find that, for 80% of the number of Type B apparatuses sold, there were circumstances under which plaintiff Nikkan Engineering would have been unable to make the sales.

Intellectual Property High Court, 2019 (Gyo-Ke) 10043 [High-Contrast Tire Pattern] <Tsuruoka>

Original Ameblo publication: 2023-10-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12822964310.html

Intellectual Property High Court, 2019 (Gyo-Ke) 10043 [High-Contrast Tire Pattern] <Tsuruoka>

* Combining a secondary reference that solved a problem different from that of the primary reference was held obvious ‘for another reason’

⇒ Inventive step of a numerically limited invention denied

‘When combining it with the Ko 1 invention, setting surface roughness at 5 μm–30 μm is ... an appropriate design choice.’

⇒ Inventive step of the numerically limited invention denied

(Extract from the court's reasoning)

[Difference 2] Invention 3 at issue contains the feature that ‘the blade wall has, over at least one-quarter of its area, an average roughness Rz of 5 μm–30 μm, and the blade wall having this average roughness is located in the lower quarter of the blade height,’ whereas the Ko 1 invention does not specify the average roughness of the wall-like structure formed from numerous fine grooves 4. ...

... Improving the distinctiveness of a display mark is one means of improving the appearance of a tire, and if there is a means of further improving the appearance of the tire of the Ko 1 invention, it can be said to be desirable. ... Since the Ko 2 document is said to aim at improving appearance, a person skilled in the art encountering the Ko 1 invention would be expected to consider the content described in the Ko 2 document. ...

The matters described in the Ko 2 document are considered suitable for further improving the appearance of the tire of the Ko 1 invention, including the display-mark portion. Therefore, a person skilled in the art can be said to have sufficient motivation to attempt to combine the matters described in the Ko 2 document with the Ko 1 invention.

... The Ko 2 document contains no idea of increasing contrast; nevertheless, as is clear from the foregoing, combination with the Ko 1 invention would be attempted for another reason. ... When combining it with the Ko 1 invention, setting surface roughness at 5 μm–30 μm can be said to fall within the scope of matters that a person skilled in the art designs as appropriate.

Intellectual Property High Court, 2017 (Gyo-Ke) 10146 [Light-Guide Film] <Tsuruoka>

Original Ameblo publication: 2023-10-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12823106349.html

Intellectual Property High Court, 2017 (Gyo-Ke) 10146 [Light-Guide Film] <Tsuruoka>

* Inventive step of a parameter invention denied

‘The trial decision did not ... find obviousness ... by further combining the projections of Reference 3 ... with the cited invention and Reference 2 ... . The numerical ranges ... concerning the shape of the “bonded portion” of the claimed invention have no critical technical significance ... .’

(Extract from the court's reasoning)

... The plaintiff argues that ... although Reference 3 describes a structure in which projections are provided on the bottom surface of a prism having an upward-facing structure, those projections cannot immediately be moved to the prism's apex, and that further referring to Reference 3 after combining the technology described in Reference 2 with the cited invention constitutes so-called ‘obviousness built upon obviousness’ and is impermissible. However, the trial decision merely cites Reference 3 as one example (basis) for considering that a person skilled in the art could implement a shape (of a fixed portion) approximately 5 μm wide and 10 μm long within the range of well-known materials and production methods ... ; it did not find the configuration relating to the difference obvious by further combining the projections on the prism's bottom surface described in Reference 3 with the cited invention and the technology described in Reference 2. ... The numerical ranges in (1) through (3) above concerning the shape of the ‘bonded portion’ of the claimed invention are not found to have critical technical significance.

Full judgment: https://www.courts.go.jp/assets/hanrei/hanrei-pdf-87773.pdf

Intellectual Property High Court, 2022 (Gyo-Ke) 10012 and 10045 [Touch-Operated Input Device] <Kanno>

Original Ameblo publication: 2023-10-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12823240127.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10012 and 10045 [Touch-Operated Input Device] <Kanno>

* Even well-known technology requires motivation, etc. for combination

⇒ The court criticized combining the primary reference and the well-known technology after abstracting their respective technical fields to a higher level.

* Prevailed at first instance against Apple on the same patent: 2007 (Wa) 2525

⇒ Inventive step upheld

‘The Ko 1 invention does not, in the first place, have a function ... to be assigned to a push switch, and ... there is neither description nor suggestion of an operation ... confirming the running direction or running speed.’

(Extract from the court's reasoning)

... The touch panel of the Ko 1 invention for controlling the running direction and running speed of magnetic tape and Well-Known Technology 1 relating to a device for inputting positional data that does not include running direction or running speed differ in what they control. Even if both share the configuration of a touch panel, it cannot be said to be easy to apply Well-Known Technology 1, which relates to a device for inputting positional data, to the Ko 1 invention, which is a device for supplying magnetic-tape control signals. Ultimately, the plaintiffs' assertion that Well-Known Technology 1 can be applied to the Ko 1 invention attempts to apply substantially different technologies by abstracting them to a higher-level concept, and is inappropriate. ...

Even assuming that Well-Known Technology 1 is understood at a higher level of abstraction as technology that generates some input information by confirming a touch-panel selection with a push switch, the Ko 1 invention does not, in the first place, have a function to be assigned to a push switch (a function for confirming a selection). Moreover, although the Ko 1 document describes continuously controlling the running direction and speed of magnetic tape with a touch panel, it neither describes nor suggests an operation for confirming the running direction or speed selected on the touch panel or a configuration such as a button corresponding to that operation. There is therefore no motivation to apply Well-Known Technology 1 to the Ko 1 invention.

Intellectual Property High Court, 2022 (Ne) 10061 [Magnetic Screen Device] <Honda>

Original Ameblo publication: 2023-10-06

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12823369472.html

Intellectual Property High Court, 2022 (Ne) 10061 [Magnetic Screen Device] <Honda>

(1) Addition or substitution of well-known, conventional technology + design matter

⇒ Violation of the extended prior-application rule

'The Otsu 10 publication contains no statement ... that there is a handle. ... At the time of filing, ... providing a handle on a case was a well-known and conventional means. ... It could be selected as appropriate when necessary for convenience in carrying, etc. ... .'

(2) Even if it does not fit entirely inside, it is 'housed'

⇒ Limitation satisfied

(Extract from the court's reasoning)

(1) ... The Otsu 10 publication discloses a configuration in which the pressing portion is fixed ... .

The Otsu 10 publication does not state that the pressing portion is rotatable. ... Making the portion that contacts a moving sheet-like object ... rotatable, and causing a roller to rotate as a result of sliding contact with a sheet, were ... well-known and conventional means at the time of filing, and this was likewise true in the field of magnetic screen devices such as Patent 1 at issue ... . Making a pressing portion whose cross-sectional shape is an arcuate surface rotatable, with the result that the pressing portion rotates owing to sliding contact with the screen that is unwound or wound while contacting it, is merely within the range of choices a person skilled in the art makes as appropriate in devising the configuration of the pressing portion ... .

The Otsu 10 publication contains no statement that the 'storage case' corresponding to ... the casing has a handle. ... At the time of filing, ... providing a handle on a case is found to have been a well-known and conventional means in the technical field of magnetic screen devices. Providing a handle on the storage case in Cited Invention 1-1 is also found to be something that a person skilled in the art could select as appropriate when necessary for convenience in carrying, etc.

(2) ... Regarding the position of the elongated member, Specification 1 contains statements concerning one embodiment such as 'The elongated member 30 is likewise housed inside the casing 40 adjacent to the screen sheet 10 in its wound state' ([0044]) and 'The elongated member 30 is positioned at the opening 46 of the casing 40' ([0048]); Figure 9 also depicts a configuration in which the elongated member is located inside the casing. However, there is no statement that the elongated member is housed inside the casing to protect it from dropping, vibration, collision, or soiling. Even in light of the remaining description in Specification 1, Invention 1 after the further correction cannot be interpreted as requiring the elongated member to be neatly contained inside the casing, without being exposed outside it, so as to be protected as much as possible from impact and soiling.

... In the appellee's product, most of the pressing roller is placed inside the main-body case, so the elongated member can be said to be housed in the casing. ... The limitation is satisfied.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91775.pdf

Tokyo District Court, 2021 (Wa) 26762 et al. [Hardener for Ground-Stabilizing Chemical Solution] <Kokubu>

Original Ameblo publication: 2023-10-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12823937535.html

2021 (Wa) 26762 et al. [Hardener for Ground-Stabilizing Chemical Solution] <Kokubu>

⇒ Prior-user right established; usurpation (unauthorized application by a non-entitled person) not found

‘The plaintiff filed ... the application ... more than fourteen years after leaving employment ... the possibility that the plaintiff completed the patented invention after leaving employment cannot be excluded ... and the defendants did not know the content of the patented invention ... .’

(Extract from the court's reasoning)

The hardener invention at issue is encompassed by the patented invention in respect of limitations B2, D, G, H, and I, and the two are found to differ in those respects. The patented invention and the hardener invention therefore cannot be said to be identical ... . There is insufficient evidence to find that Bi and Ci conceived the configuration relating to the differences between those inventions and contributed to the creative activity of concretizing it to complete the patented invention; nor can it be found from all the evidence in this case that the two invented the patented invention. Accordingly, Bi and Ci cannot be found to have been the inventors of the patented invention. ... The patent cannot be said to have been granted ... on an unauthorized application.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-92102.pdf

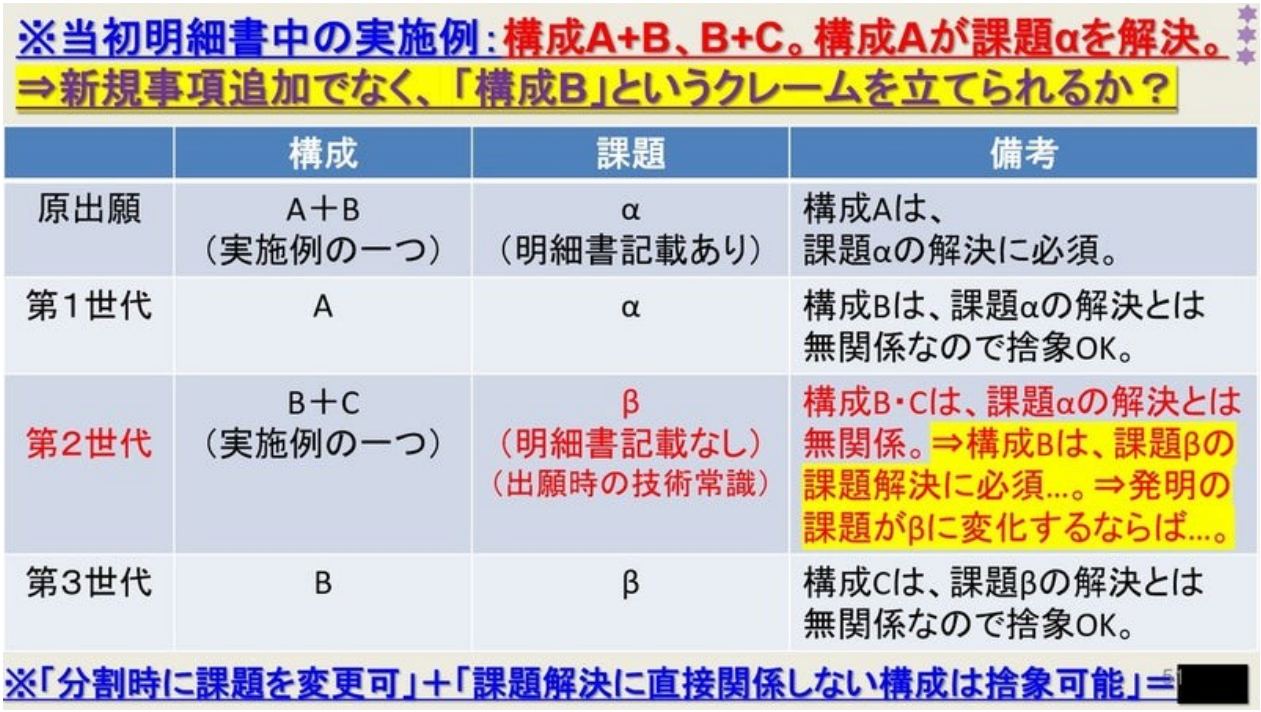
Intellectual Property High Court, 2021 (Gyo-Ke) 10152 [Method for Resin-Sealing Permanent Magnets] <Honda>

Original Ameblo publication: 2023-10-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12823937904.html

Intellectual Property High Court, 2021 (Gyo-Ke) 10152 [Method for Resin-Sealing Permanent Magnets] <Honda>

* A divisional application deleting a configuration essential to solving the problem



⇒ Support requirement not satisfied

‘According to ... the specification, a transport tray is an essential configuration for solving Problem 2 of the prior art ... nor is there evidence ... that an alternative configuration is clear ... to a person skilled in the art.’

(Extract from the court's reasoning)

Invention 1 includes not only an invention with a configuration including a transport tray carrying a laminated rotor core, but also an invention with a configuration without that transport tray. If the claims are taken as written without including the transport tray as a component, ... the invention cannot be said to fall within the scope in which it can be recognized that the problem of Invention 1—providing a method of resin-sealing permanent magnets permitting inexpensive operation—can be solved. ... Paragraph [0010] contains a detailed description of the invention premised on ... not making the transport tray an essential configuration. However, ... according to the detailed description in the specification, the transport tray is essential to solving Problem 2 of the prior art; thus, solving the problem of the invention without a transport tray is understood to require a configuration replacing it. Although the specification contains descriptions ... of the specific structure of the transport tray, it contains no description specifically suggesting a replacement configuration, and there is no evidence sufficient to establish that such a replacement would be clear to a person skilled in the art. Therefore, even in light of common general technical knowledge at filing, it cannot be said to fall within a scope in which a person skilled in the art could recognize, without any specific description in the detailed description, that the problem relating to the steps of fixing the laminated rotor core on the lower mold and removing it from that mold could be solved.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-92382.pdf

Translation of the author’s explanatory diagram (a hypothetical sequence of divisional applications):

Premise and question: The embodiments in the original specification include feature combinations A + B and B + C. Feature A solves problem α. Can a claim directed to feature B be drafted without adding new matter?

The table has three substantive columns: Features; Problem; Remarks.

Original application — Features: A + B (one of the embodiments). Problem: α (stated in the specification). Remarks: Feature A is essential to solving problem α.

First generation — Features: A. Problem: α. Remarks: Feature B is unrelated to solving problem α, so it may be omitted.

Second generation — Features: B + C (one of the embodiments). Problem: β (not stated in the specification; common general technical knowledge at filing). Remarks: Features B and C are unrelated to solving problem α. Feature B is essential to solving problem β … Thus, if the problem addressed by the invention changes to β … .

Third generation — Features: B. Problem: β. Remarks: Feature C is unrelated to solving problem β, so it may be omitted.

The diagram’s concluding line reads: ‘The problem may be changed when filing a divisional application’ + ‘Features not directly related to solving the problem may be omitted’ ⇒ [text obscured in the source image].

Tokyo District Court, 2012 (Wa) 15621 [Cu-Ni-Si Alloy with Excellent Strength and Bendability] <Presiding Judge Takano; signed on his behalf by Judge Mitsui>

Original Ameblo publication: 2023-10-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12824183089.html

Tokyo District Court, 2012 (Wa) 15621 [Cu-Ni-Si Alloy with Excellent Strength and Bendability] <Presiding Judge Takano; signed on his behalf by Judge Mitsui>

The ‘invention for which the patent application was filed’ is the invention after correction

⇒ The court rejected the defendant’s argument that the numerical range before correction should be used as the basis for determining the prior-user right.

★ This connects with the issue of ‘encroachment’ by a prior-user right!

Cf. Intellectual Property High Court, 2020 (Ne) 10004 [Light-Irradiation Device]

(Extract from the court's reasoning)

On the premise that the ‘invention for which the patent application was filed’ in Article 79 of the Act should be interpreted as meaning the invention in the application actually filed, the defendant argues that the local maximum values of the X-ray random intensity ratios of its respective prior-used products fell within the range of 2.0 to 10.0, inclusive, that applied before the First Correction at issue. However, because the trial decision concerning the Second Correction became final and binding, the patent application is deemed to have been filed on the basis of the specification, claims, or drawings after correction (Article 128 of the Act). It is therefore clear that the ‘invention for which the patent application was filed’ in this case is the invention after the Second Correction.

Intellectual Property High Court, 2019 (Gyo-Ke) 10126 <Tsuruoka> [Steel Sheet-Pile Press-In and Extraction Machine], third judgment

Original Ameblo publication: 2023-10-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12824319969.html

Intellectual Property High Court, 2019 (Gyo-Ke) 10126 <Tsuruoka> [Steel Sheet-Pile Press-In and Extraction Machine], third judgment

Inventive step denied

No counterargument from the patentee throughout the trial decisions and judgments

Trial decision favorable to the patentee

Judgment unfavorable to the patentee

⇒ However, this is not a matter subject to deemed admission. This judgment reached its conclusion after assessing inventive step, etc.

(Extract from the court's reasoning)

It is established that similar invalidity grounds were asserted in the trial proceedings at issue and in the invalidation-trial proceedings relating to the second trial decision, so a conflict with the second trial decision, etc. is not entirely without issue. However, according to the same evidence, the invalidity grounds asserted in the two proceedings differed in their primary references as well as in the evidence submitted in support of them. Therefore, the plaintiff's assertion of lack of inventive step based on the Ko 1 invention in this case does not violate the effect of the second trial decision; nor is there sufficient evidence to find that the assertion reopens an already settled issue and thereby violates the principle of good faith.

Intellectual Property High Court, 2020 (Gyo-Ke) 10054 [Nucleic-Acid Decomposition Treatment Apparatus] <Kanno>, second judgment

Original Ameblo publication: 2023-10-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12824515153.html

Intellectual Property High Court, 2020 (Gyo-Ke) 10054 [Nucleic-Acid Decomposition Treatment Apparatus] <Kanno>, second judgment

* Second judgment after a request for correction following the first judgment denying inventive step

⇒ The court examined the obviousness of the configuration added by correction.

(* No discussion of its relationship to the other differences.)

‘It is further determined ... whether the configuration of Corrected Invention 2 ... can be called obvious.’

(Extract from the court's reasoning)

... Since actions to rescind trial decisions are governed by the Administrative Case Litigation Act, the binding effect of the above rescission judgment extends to the renewed examination and trial decision under Article 33(1) of that Act. This binding effect covers the factual findings and legal determinations necessary to derive the operative part of the judgment, and findings or determinations conflicting with those of the rescission judgment are impermissible (see Supreme Court, Third Petty Bench, judgment of April 28, 1992, Minshu Vol. 46, No. 4, p. 245). An action to rescind the trial decision challenging that trial must likewise be decided on that premise. ...

The trial decision at issue ... added to that difference the feature ‘characterized by maintaining the differential pressure inside the exposure chamber at a constant negative pressure,’ which was a configuration added to Corrected Invention 2 by the Correction at issue. In view of the foregoing sequence of events, assessing inventive step of Corrected Invention 2 requires ... further determining whether its configuration of ‘maintaining the differential pressure inside the exposure chamber at a constant negative pressure’ can be called obvious. ...

A person skilled in the art encountering Ko 1 and Ko 2 would be motivated, in order both to generate sterilizing gas of a stable concentration in the Ko 1 invention and to obtain a sufficiently assured sterilizing effect, to apply the configuration described in Ko 2 for controlling the formaldehyde-gas concentration, humidity, and temperature in the space to be sterilized to respective predetermined values and maintaining a constant pressure in that space. ...

Intellectual Property High Court, 2014 (Gyo-Ke) 10057 [Deposit Terminal] <Ishii>

Original Ameblo publication: 2023-10-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12824709803.html

Intellectual Property High Court, 2014 (Gyo-Ke) 10057 [Deposit Terminal] <Ishii>

* General principles for amendments increasing the number of claims

‘Article 17-2(5)(ii) of the Patent Act ... does not turn on whether the amendment increases the number of claims; rather, it is necessary and sufficient that (1) ... narrowing ..., (2) ... limitation ..., and (3) the industrial fields of application and the problems to be solved ... before and after amendment ... are the same.’

(Extract from the court's reasoning)

... Article 17-2(5)(ii) of the Patent Act ... clearly prescribes its requirements, including the parenthetical wording. Therefore, for an amendment to fall within one aimed at ‘narrowing the scope of claims’ under that item, the question is not whether it is a so-called amendment increasing the number of claims. Rather, it is necessary and sufficient to satisfy the requirements ... that (1) it narrows the scope of claims; (2) it limits matters necessary to specify the invention recited in the pre-amendment claim; and (3) the industrial fields of application and problems to be solved of the invention recited in that claim before amendment and the invention recited in that claim after amendment are identical ... .

Intellectual Property High Court, 2011 (Gyo-Ke) 10115 [Cyclohexane Compound] <Takizawa>

Original Ameblo publication: 2023-10-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12824853593.html

Intellectual Property High Court, 2011 (Gyo-Ke) 10115 [Cyclohexane Compound] <Takizawa>

* Eligible as a cited invention

The reference expressly states the dielectric-anisotropy and optical-anisotropy values of the cited invention, and thus its inventor had actually produced the cited invention.

The (pure) starting materials described in the reference were not difficult to obtain either.

(Extract from the court's reasoning)

There is no dispute that the claimed invention encompasses the cited invention, and the claimed invention ... claims a particular novel compound. Accordingly, for the claimed invention to be said to be described in the reference, a person skilled in the art must have been able to produce the cited invention encompassed by it by considering the reference's description and common general technical knowledge at the filing date. ...

... In attempting to synthesize the cited invention described in the reference, a person skilled in the art would recognize that the cited invention could be obtained by using ... . This is also corroborated by the fact that ... the reference expressly states the dielectric-anisotropy and optical-anisotropy values of the cited invention, and thus its inventor had actually produced it.

Osaka District Court, 2008 (Wa) 10819, and its appellate judgment, Intellectual Property High Court, 2013 (Ne) 10026 <Iimura>

Original Ameblo publication: 2023-10-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12824994527.html

Osaka District Court, 2008 (Wa) 10819, and its appellate judgment, Intellectual Property High Court, 2013 (Ne) 10026 <Iimura>

[Method and Apparatus for Mixing Powder and Granules and Removing Fine Powder]

‘... The defendant's publicly worked invention cannot be said to fall within the technical scope of the respective patented inventions, and the assertion of a prior-user right lacks its premise ... .’

⇒ This decision, too, connects with the discussion of ‘encroachment’ by a prior-user right.

* Indirect infringement under item (iv) established for some of the Type B apparatuses

(Note) The first-instance court denied indirect infringement under Article 101(iv) of the Patent Act for the Type A product, but found indirect infringement under Article 101(v) in relation to Patented Invention 1 and under Article 101(ii) in relation to Patented Invention 2. For some Type B products, it found indirect infringement under Article 101(iv) in relation to Patented Invention 1. The following extract concerns the first-instance court’s determination under Article 101(iv) for the Type A product.

(Extract from the court's reasoning)

... The Type A product is not itself connected to a material supply source and is not an apparatus premised on processing multiple kinds of materials; its configuration also allows it to be used solely to remove fine powder from a single material. Accordingly, the Type A product is not a ‘product used exclusively for use of the process’ of Patented Invention 1. The defendant's acts concerning the Type A product therefore do not constitute indirect infringement under Article 101(iv) of the Patent Act of the patent right relating to Patented Invention 1.

Intellectual Property High Court, 2022 (Gyo-Ke) 10094 [Insole] <Honda>

Original Ameblo publication: 2023-10-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12825135207.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10094 [Insole] <Honda>

‘For the cited invention ... in light of common general technical knowledge, etc., applying the Ko 2 technology based on the technical concept of adjusting a projection to an appropriate position, so as to adjust the position of the toe post more appropriately to an individual's foot ... and providing multiple toe-post mounting holes in the left-right direction as well would be ... readily conceivable.’

(Extract from the court's reasoning)

... The Ko 2 technology, too, can be said to present the technical concept of adjusting a projection to an appropriate position according to the dimensions and shapes of the shoe and foot, so that supporting the projection between the toes, etc. prevents friction between the toes and the shoe.

... It is a publicly known fact that the shapes, lengths, widths, etc. of toes differ among individuals, and it is found to be common general technical knowledge (the Technical Knowledge at issue) that the position of the interdigital cleft differs among individuals not only front-to-back but also left-to-right (Ko 3-1 and 3-2).

Furthermore, when walking in shoes, a foot can move within a certain range inside the shoe not only front-to-back but also left-to-right, depending on the dimensions and shapes of the shoe and foot, the direction of travel, road-surface conditions, etc. In such cases, the direction of movement is not clearly divided into front-to-back or left-to-right; movement in oblique directions can also be envisaged.

... In view of the foregoing, it should be said that a person skilled in the art encountering Ko 1 could readily conceive, with respect to the cited invention and in light of the ... common general technical knowledge, etc. described above, of applying the Ko 2 technology based on the technical concept of adjusting a projection to an appropriate position in order to adjust the toe-post position more appropriately to an individual's foot, and configuring the mounting position of toe post 14A located in the interdigital cleft between the first and second toes to have multiple toe-post mounting holes not only in the front-to-back direction of insole body 4A but also in the left-to-right direction.

Intellectual Property High Court, 2022 (Ne) 10094 [Composition Containing ... Tetrafluoropropene] <Hibiku Shimizu>

Original Ameblo publication: 2023-10-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12825253409.html

Intellectual Property High Court, 2022 (Ne) 10094 [Composition Containing ... Tetrafluoropropene] <Hibiku Shimizu>

Fourth generation of 2019 (Wa) 30991

The specification does not describe a problem.

⇒ Even if a problem could be inferred, the invention is not described in the specification, so the support requirement is not satisfied.

First instance, Tokyo District Court, 2021 (Wa) 29388: divisional-application requirements not satisfied (addition of new matter) ⇒ Novelty denied

(Extract from the court's reasoning)

... The specification can be said to state that HFO-1234yf is known to have a low global warming potential (GWP) and is a good candidate to replace high-GWP saturated HFC refrigerants; that small amounts of certain additional compounds are present when HFO-1234yf is prepared; that one of the additional compounds contained in the composition of the invention is less than approximately 1 weight percent HFC-143a; and that byproducts arising in the process of preparing HFO-1234yf, and impurities contained in HFO-1234yf or its starting materials (HCFC-243db, HCFO-1233xf, and HCFC-244bb), constitute additional compounds.

However, it is clear even from the wording of [0010] itself that HFO-1234yf was already known before the original filing date to be useful as a compound having a low global warming potential (GWP). Therefore, unless the specification describes what technical significance results from the presence of small amounts of additional compounds when preparing HFO-1234yf, what effects arise, and what problem is thereby solved, it cannot be said to describe the problem the invention sought to solve. Yet the specification says nothing about these points; nor does its remaining description contain any passage suggesting the problem the invention sought to solve. Under ‘Technical Field,’ the specification states: ‘The present disclosure relates to the field of compositions useful as heat-transfer compositions, aerosol propellants, foaming agents, blowing agents, solvents, cleaning agents, carrier fluids, displacement drying agents, buffing abrasives, polymerization media, expansion agents for polyolefins and polyurethanes, gaseous dielectrics, fire-extinguishing agents, and fire-extinguishing agents in liquid or gaseous form. In particular, the present disclosure relates to compositions useful as heat-transfer compositions, such as compositions containing 2,3,3,3,-tetrafluoropropene (HFO-1234yf or 1234yf), or 2,3-dichloro-1,1,1-trifluoropropane (HCFC-243db or 243db), 2-chloro-1,1,1-trifluoropropene (HCFO1233xf or 1233xf), or 2-chloro-1,1,1,2-tetrafluoropropane (HCFC-244bb)’ ([0001]). However, that passage merely explains the technical field to which the invention belongs and does not enable an understanding of the problem the invention seeks to solve. Accordingly, the ‘problem to be solved by the invention’ formally stated in the specification is insufficient as a description of the problem of this invention, and it must be said that the specification does not describe that problem. That being so, it also cannot be said that a person skilled in the art could recognize from the specification that the problem of the invention can be solved. ...

Even if the above wording of [0001] were understood as explaining the problem of the invention, ... that problem would have to be understood as ‘providing a composition useful as a heat-transfer composition,

such as a composition containing 2,3,3,3,-tetrafluoropropene (HFO-1234yf or 1234yf), or 2,3-dichloro-1,1,1-trifluoropropane (HCFC-243db or 243db), 2-chloro-1,1,1-trifluoropropene (HCFO-1233xf or 1233xf), or 2-chloro-1,1,1,2-tetrafluoropropane (HCFC-244bb).' The invention would then solve that problem through a composition containing (1) HFO-1234yf, (2) no more than 0.2 weight percent HFC-143a, and (3) no more than 1.9 weight percent HFC-254eb. However, the specification cannot be said to describe a composition containing (1) through (3). ... Moreover, the specification neither states nor suggests in what sense a composition having this configuration would be a 'useful' composition beyond the above usefulness of HFO-1234yf itself. Therefore, a person skilled in the art also could not understand from the specification that a composition having the configurations (1) through (3) is a composition 'useful' as a heat-transfer composition. Accordingly, a person skilled in the art would not recognize from the specification that the problem of the invention can be solved.

[U.S. Patents] Netflix v. DivX (CAFC, September 11, 2023) – Analogous Art

Original Ameblo publication: 2023-10-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12825329121.html

[U.S. Patents] Netflix v. DivX (CAFC, September 11, 2023) – Analogous Art

In re Bigio, 381 F.3d 1320, 1325 (Fed. Cir. 2004).

⇒ The test for whether prior art constitutes 'analogous art' (eligibility as a cited invention)

– (1) Whether the art is from the same field of endeavor, regardless of the problem addressed;

or

– (2) If the reference is not within the field of the inventor's endeavor, whether the reference still is reasonably pertinent to the particular problem with which the inventor is involved.

In Netflix, the PTAB held that Netflix had not argued (1), then rejected (2), and denied analogous-art status (eligibility as a cited invention).

By contrast, although the CAFC agreed with the PTAB on (2), it remanded to the PTAB for reconsideration of (1), holding that, viewed in substance, Netflix's arguments did address (1).

*** Even in the United States, (2) above from In re Bigio concerns the similarities and differences between the problem of the invention at issue and those of the primary and secondary references, so at first glance one might mistakenly think it is the same as in Japan. However, according to what I heard from U.S. counsel, in most cases the technical field is common under (1), so the analysis never reaches (2), making arguments under (2) weak. Indeed, in Netflix as well, (1) seems likely ultimately to be upheld on remand. Thus, differences between Japanese and U.S. inventive-step assessments still remain, and Netflix might even be understood as highlighting those differences instead.**

Tokyo District Court, 2020 (Wa) 25891 [... Filtered Cigarette] <Shibata>

Original Ameblo publication: 2023-10-23

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12825643857.html

Tokyo District Court, 2020 (Wa) 25891 [... Filtered Cigarette] <Shibata>

'Mainstream smoke passes through without substantially contacting the smoke-modifying agent' means providing a channel to preserve taste quality, etc. that is not substantially altered by keeping the contents of the mainstream smoke from contacting the smoke-modifying agent.

⇒ The defendant's product has a smoke-modifying agent in a portion without a channel

⇒ Limitation not satisfied

= Appeal: Intellectual Property High Court, 2023 (Ne) No. 10015 <Hibiku Shimizu>

(Extract from the court's reasoning)

Limitation I provides that 'mainstream smoke passes through without substantially contacting the smoke-modifying agent.' As for the position on the cigarette of the 'smoke-modifying agent' that the mainstream smoke does not contact, the claims place a line break immediately before 'mainstream smoke passes through without substantially contacting the smoke-modifying agent' in limitation I, separating it from limitations A through H. In addition, the 'smoke-modifying agent' in limitation I is not worded, for example, as 'said smoke-modifying agent' so as to limit the agent concerned to a configuration described in another limitation. Accordingly, the claims can be understood as describing, respectively, the configurations of limitations A through H and the configuration of limitation I as configurations of the 'cigarette' (limitation J). On the face of the claims, the wording in limitation I that 'mainstream smoke passes through without substantially contacting the smoke-modifying agent' can be understood to mean that, in the cigarette of the invention, mainstream smoke generated in the tobacco rod does not substantially contact a smoke-modifying agent before reaching the mouth end.

Original Ameblo publication: 2023-11-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12826996220.html

Osaka District Court, 2020 (Wa) 3473 [Lighting Fixture] <Matsuami>

<Damages> Rebuttal of the presumption under Article 102(2): rebutted by 80%

<Grounds for rebutting the presumption>

(1) Significance 1 at issue—preventing deformation and damage to the exterior portion—is a function and element that a product should naturally ensure.

⇒ It can also be achieved through technologies other than the invention, such as choices of material, bracket-mounting method, and mounting-portion structure.

(2) Significance 3 contributes to reducing manufacturing costs by reducing the defect rate, but the extent of cost reduction (reflection in product prices) is unknown.

(3) Alternative technology: the fact that the plaintiff's successor product achieves similar effects through technology different from the invention is a circumstance rebutting the presumption to a large extent.

(4) Competing products: generally in approximately the same price range as the plaintiff's practicing product and the defendant's products.

(Extract from the court's reasoning)

Significance 1 at issue

Spotlight products generally had existed on the market long before the patented invention, and a mature market had already formed (Otsu 5; entire purport of the oral argument). According to a market-trend survey, development of spotlight products with high added value in color rendering, color temperature, etc. is expected (Otsu 30 and 31). Catalogs, etc. of the plaintiff, defendant, and competitors also appear to promote light-distribution control and characteristics, light color, lens design, energy savings, product size, lightness, design, etc. (Ko 5 and 6; Otsu 15, 16, and 25–29). By contrast, Significance 1, preventing deformation and damage to the exterior portion, may be said to be, so to speak, a function and element that a product should naturally ensure. Moreover, it can also be achieved through technologies other than the respective inventions, such as choices of material, bracket-mounting method, and mounting-portion structure, and is considered to be an effect generally achieved in practice by lighting-fixture manufacturers.

Since 2014, the plaintiff has also sold, under the same series and product names as its practicing product, a successor product that prevents deformation and damage to the exterior portion by attaching the bracket to the exterior portion rather than the heat-dissipating portion and making the exterior portion thick-walled (entire purport of the oral argument). In other words, Significance 1 can be assessed as having only such customer-attracting power that a product lacking it can still be sold to customers as the same series and product. This remains so even taking into account that, although the catalog does not expressly state Significance 1 in words, the characteristics relating to it can be perceived from the product photographs.

Significance 3 at issue

Significance 3 can be said to contribute to reducing manufacturing costs through a lower defect rate, but, considering that the extent of the cost reduction (reflection in product prices) due to Significance 3 is unknown, etc., it cannot be found to contribute greatly to profits on the defendant's products.

In view of these circumstances, the customer-attracting power of Significance 1 and Significance 3 is limited, and it must be said that their contribution to sales of the defendant's products is small.

Sales performance

The plaintiff has not manufactured its practicing product since the registration date at issue, its sales methods (channels), etc. are substantially limited, and the scale is extremely small. Although the plaintiff sells its successor product, that product achieves effects similar to those of the respective inventions through different technology. While these matters cannot be said to negate the underlying facts for the presumption under Article 102(2) of the Patent Act explained in (1) above, they should be regarded as circumstances rebutting the presumption to a large extent.

Competing products

During the relevant period, multiple products had the feature that the bracket was attached not to the exterior portion but to another portion, including the heat-dissipating portion: these included Panasonic's TOLSO series (Otsu 25), Odelic's C1000 series (Otsu 27-2 to 27-4), and Mitsubishi Electric's AK, Saimei, Senmei, and LED Spotlight series (Otsu 29). These products are generally in approximately the same price range as the plaintiff's practicing product and the defendant's products.

In view of the foregoing, competing products are found to exist for the defendant's products, and their existence also constitutes a circumstance rebutting the presumption.

Considering the foregoing circumstances comprehensively, with particular emphasis on the technical significance of the patented invention and the sales situation of the practicing product, the probability that, absent sales of the defendant's products, the corresponding demand would have been directed to the plaintiff's practicing or successor product should instead be regarded as low. It must therefore be said that 80% of the damages presumed under Article 102(2) of the Patent Act are rebutted. Neither the plaintiff's nor the defendant's arguments to the contrary can be accepted.

An IP High Court Judgment on the Meaning of a ‘Trademark Widely Recognized Among Consumers’ as a Requirement for Registration of a Defensive Mark

Original Ameblo publication: 2023-11-03

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12827166886.html

[Trademark / Article] An IP High Court Judgment on the Meaning of a ‘Trademark Widely Recognized Among Consumers’ as a Requirement for Registration of a Defensive Mark (Patent Studies, March 2011; Masaharu Miyawaki)

In 2009 (Gyo-Ke) 10189, the Intellectual Property High Court required strong distinctiveness—that is, fame—sufficient to cause confusion as to commercial origin even for dissimilar goods or services

⇒ The article regards the conclusion as appropriate but disagrees with the general proposition.

https://www.inpit.go.jp/content/100126269.pdf

Intellectual Property High Court, 2021 (Gyo-Ke) 10090 [Spray Product and Spraying Method] <Otaka>

Original Ameblo publication: 2023-11-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12827279339.html

Intellectual Property High Court, 2021 (Gyo-Ke) 10090 [Spray Product and Spraying Method] <Otaka>

* Even if a purpose is not manifested in a publicly used product, an objectively ascertainable product effect is a point of identity. ⇒ Inventive step denied

Whether the ‘water’ in the publicly used product corresponds to the ‘volatilization-suppressing component’ of the invention is determined by whether it can objectively be understood to be a component for suppressing volatilization after spraying.

⇒ Not affected by the purpose of its addition or whether it was recognized as a volatilization-suppressing component.

* Correction requirements not satisfied

Merely describing the effects produced by a configuration does not constitute narrowing.

(Extract from the court's reasoning)

<Inventive step> ⇒ Inventive step denied

The ‘water having a vapor pressure of 2.3366 kPa at 20°C’ contained in Publicly Worked Invention 1-1 is found to correspond to the ‘volatilization-suppressing component’ of Invention 1, so Difference 1 is not found to be a substantive difference. ... On this point, the trial decision gives as one reason for finding Difference 1 substantive that, although Publicly Worked Invention 1-1 contains water, according to Ko 2 the water was added as a ‘solvent’ and cannot be found to have been recognized as a volatilization-suppressing component for suppressing volatilization after spraying. However, in light of the fact that the scope of claims of a patent for a product invention is specified by its structure, characteristics, etc., whether the ‘water’ contained in Publicly Worked Invention 1-1 corresponds to the ‘volatilization-suppressing component’ of Invention 1 should be determined by whether that water can objectively be understood to be a component for suppressing volatilization after spraying. The determination is therefore not affected by the purpose for which water was added or whether it was recognized as a volatilization-suppressing component for suppressing volatilization after spraying.

<Correction requirements> ⇒ Correction requirements not satisfied

Correction Item 1 ... changes ‘spray product’ to ‘spray product with reduced mucous-membrane irritation,’ and Correction Item 2 ... changes ‘spraying method’ to ‘spraying method that reduces mucous-membrane irritation.’ ... They are found to add to the respective descriptions ‘spray product’ and ... ‘spraying method’ wording concerning an action, namely ‘with reduced mucous-membrane irritation’ or ‘that reduces mucous-membrane irritation,’ respectively. ...

The specification neither describes nor suggests that, even with the respective configurations in pre-correction claims 1 and 3, there are cases in which the effect of ‘reducing mucous-membrane irritation’ is not produced. Accordingly, the wording concerning an action added by Correction Items 1 and 2, ‘with reduced mucous-membrane irritation’ or ‘that reduces mucous-membrane irritation,’ merely describes the effects produced by the respective configurations in pre-correction claims 1 and 3. Correction Items 1 and 2 therefore cannot be found to narrow the scope of claims for the respective inventions in pre-correction claims 1 and 3. ... Accordingly, Correction Items 1 and 2 cannot be found to aim at ‘narrowing the scope of claims’ ... .

Intellectual Property High Court, 2022 (Gyo-Ke) 10017 [Pressure-Sensitive Transfer Adhesive Tape] <Kanno>

Original Ameblo publication: 2023-11-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12827397676.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10017 [Pressure-Sensitive Transfer Adhesive Tape] <Kanno>

<Clarity requirement>

* Products not satisfying the claimed effect ‘configured to be capable of causing paper tearing’ are excluded from the invention.

⇒ Clarity upheld even though the claims do not specify the frequency or conditions of occurrence of ‘paper tearing’

<Inventive step>

* Even if the numerical range overlaps the cited reference, the values are not disclosed as significant in relation to the claimed effect ‘capable of causing paper tearing.’ ⇒ A difference

* Configurations that do not cause ‘paper tearing’ are also explained as comparative examples.

Cf. Intellectual Property High Court, 2021 (Gyo-Ke) 10091 [Adhesive Tape] <Honda>

(Extract from the court's reasoning)

<Clarity requirement>

... Considering the description and drawings in the specification together, ‘paper tearing’ in Invention 1 can be understood as the phenomenon in which, when the adhesive layer of an adhesive product is peeled off, the surface layer of the paper adheres to the adhesive and the paper ruptures in its thickness direction. The feature specifying Invention 1 as ‘configured to be capable of causing paper tearing’ can be interpreted as selecting, from among ‘pressure-sensitive transfer adhesive tapes’ satisfying the other limitations, those configured to be ‘capable of causing paper tearing’; configurations ‘incapable of causing paper tearing’ can be understood not to fall within the technical scope of Invention 1. Accordingly, even though claim 1 relating to Invention 1 does not specify the frequency or conditions of occurrence of ‘paper tearing,’ the claims cannot be said to be so unclear as to cause unforeseen harm to third parties.

<Inventive step>

... Leaving aside the lack of evidence that all commercially available ‘permanent bonding type’ tape glues are ‘capable of causing paper tearing,’ ... Invention 1 ... presupposes ‘pattern coating.’ According to the specification ... none of the comparative examples subjected to pattern coating exhibited the property of being capable of tearing paper ... ; Comparative Example 9, etc. ... expressly state that ‘the adhesive layer was partially deactivated so that only the adhesive positioned in substantially the same locations as the adhesive arrangement in the coating pattern used in the pattern-coating suitability test exhibited adhesive force.’ ... The plaintiff also argues ... regarding Differences 3 and 4 that they fall within the scope of well-known technology because they overlap the numerical ranges stated in the respective documents it invokes. However, the numerical ranges in those documents are not disclosed as values significant in relation to paper tearing ... and the argument misses the point.

Tokyo District Court, 2021 (Wa) 29388 [HFO-1234yf] <Sugiura> — Fourth generation of the patent in 2019 (Wa) 30991

Original Ameblo publication: 2023-11-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12827806311.html

Tokyo District Court, 2021 (Wa) 29388 [HFO-1234yf] <Sugiura>

Fourth generation of the patent in 2019 (Wa) 30991

The original application's initial specification neither describes nor suggests the technical significance of the ‘additional compounds’ incorporated into the claim!!

⇒ It merely described the presence of small amounts of impurities and byproducts

⇒ Divisional-application requirements not satisfied (addition of new matter)

⇒ Novelty denied

Cf. The appellate court, the Intellectual Property High Court, 2022 (Ne) No. 10094 <Hibiku Shimizu>, held that the invention claimed in the divisional application was not described in the specification and found that the support requirement was not satisfied.

(Extract from the court's reasoning)

... The original application's initial specification lists other compounds to be combined with HFO-1234yf as embodiments of the invention originally disclosed. Although HFC-143a is expressly included, HFC-254eb is not expressly mentioned and is not included among the compounds used to make the disclosed compositions ... ; it is merely shown in the above examples as one product of the uncatalyzed conversion of HCFC-244bb to HFO1234yf. Although these products could also be understood as certain additional compounds ... present in small amounts when preparing new low-global-warming-potential compounds such as HFO-1234yf, the original application's initial specification contains no description or suggestion of the technical significance, etc. of the presence of these ‘additional compounds.’ Accordingly, the products other than HFO-1234yf shown in Examples 15 and 16 are understood merely as descriptions that, when preparing HFO-1234yf, small amounts of impurities or byproducts ... contained in its starting materials, etc. are present as ‘additional compounds.’ ... The examples must be understood merely to state the compounds found by analysis and their proportions. ...

... The claims of the original application describe compositions, etc. containing HFO-1234yf and HFC-254eb together with at least one member selected from the group consisting of HFC-245cb and HFC-143a. Even taking that description into account, however, one cannot necessarily derive selecting HFC-143a and HFC-254eb in addition to HFO-1234yf from those compositions, specifying the amounts of those two components as no more than 0.2 wt% HCFC-143a and no more than 1.9 wt% HFC-254eb, and combining them with HFO-1234yf.

Original Ameblo publication: 2023-11-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12828723031.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10111 [Beltline Molding for a Vehicle Door] <Honda>

The specification does not describe the technical significance of the stepped portion extending ‘substantially horizontally.’

Whether the stepped portion extends ‘substantially horizontally’ or ‘slightly downward’ does not change the effects produced by the invention.

⇒ Merely a design matter. Inventive step denied

* A feature specifying the invention whose technical significance is not described in the specification, and which does not affect the invention's effects.

⇒ Merely a design matter; inventive step denied

Technical significance is also at issue in parameter inventions

Intellectual Property High Court, 2021 (Gyo-Ke) 10096

Intellectual Property High Court, 2021 (Gyo-Ke) 10135

Intellectual Property High Court, 2010 (Gyo-Ke) 10296

Intellectual Property High Court, 2006 (Gyo-Ke) 10132

Intellectual Property High Court, 2005 (Gyo-Ke) 10665

Intellectual Property High Court, 2005 (Gyo-Ke) 10754

Intellectual Property High Court, 2005 (Gyo-Ke) 10189

(Extract from the court's reasoning)

The specification contains no description of the technical significance of the stepped portion extending inward ‘substantially horizontally’ from the lower portion of the vertical flange. ... Whether the stepped portion extends ‘substantially horizontally’ or ‘slightly downward’ does not change any of the effects produced by the invention. Accordingly, no technical significance is found in having the stepped portion extend ‘substantially horizontally.’ In the Ko 1 Invention 1 as well, no technical significance is found in the stepped portion extending ‘slightly downward’ from the lower portion of the vertical flange toward the vertically moving window glass (inward). Configuring the ‘slightly downward’ stepped portion of Ko 1 Invention 1 to extend ‘substantially horizontally’ should therefore be regarded as merely a design matter that a person skilled in the art may undertake as appropriate.

[Article] Individual Directors' Liability for Damages to Patentees in Patent-Infringement Cases (Keijiro Miwa and Kazunari Sugimitsu) (Patent, Vol. 76, No. 5, 2023)

Factors for assessing the duty of due care of a prudent manager

(1) Duty to investigate, including obtaining an opinion from an impartial expert

(2) Cessation of working acts and reserving an amount equivalent to damages

⇒ At the time of the article's review, no uniform standard had been established.

https://jpaa-patent.info/patent/viewPdf/4202

Osaka District Court, 2017 (Wa) 7384 [Massage Machine] <Damages>

Original Ameblo publication: 2023-11-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12829494841.html

Osaka District Court, 2017 (Wa) 7384 [Massage Machine] <Damages>

<Damages> Rebuttal of the presumption under Article 102(2): 98% rebutted (Invention 2), 85% rebutted (Invention 3)

JPY 5.5 billion claimed; approximately JPY 2.78 billion awarded

<Grounds for rebutting the presumption>

(1) Invention II made only a slight contribution, while Invention III made a limited contribution. Most of the defendant’s products relating to Invention II were purchased because of functions or other features unrelated to the characteristics of Invention II.

(2) Numerous competing products are made by Panasonic, which has the second-largest market share.

(* Although the percentages rebutted differ between Invention II and Invention III, the wording applying the law in the judgment is largely the same.)

(Extract from the court's reasoning)

Among the defendant's products at issue, those relating to Invention II received only a slight contribution from Invention II, and most are found to have been purchased because of functions, etc. other than the features of Invention II. Taking into account, in addition, the existence of numerous competing products made by Panasonic, which has the second-largest share of the massage-chair market, and other circumstances, there are circumstances substantially impairing the causal relationship between the defendant's profits and the plaintiff's damage. It is therefore appropriate to find the presumption rebutted for 98% of the defendant's profits.

For the defendant's products relating to Patent III, the contribution of Invention III can be said to be limited. Considering the existence of numerous competing Panasonic products mentioned above and other circumstances, there are circumstances impairing to a considerable degree the causal relationship between the defendant's profits and the plaintiff's damage. It is therefore appropriate to find the presumption rebutted for 85% of the defendant's profits.

For the defendant's products relating to both Patents II and III, it is appropriate, as with those relating to Patent III, to find the presumption rebutted for 85% of the defendant's profits.

<Application of Article 102(3) to the rebutted portion>

Even where rebuttal of the presumption under Article 102(2) of the Patent Act is accepted, so that the amount of lost profits from a reduction in the profits earned by the patentee from practicing the invention, etc., presumed from the infringer's profits, cannot be recognized as damages without adjustment, the invention was nonetheless worked without permission in respect of that portion. The assessment of damage for that portion therefore cannot be said to be exhausted, and it is appropriate to interpret that the patentee, etc. may seek compensation for the loss of royalties it should have received from the infringer. Accordingly, it is appropriate to interpret that damages under Article 102(3) may be claimed for the portion for which the presumption under paragraph (2) has been rebutted.

Intellectual Property High Court, 2021 (Ne) 10088 and 2022 (Ne) 10014 [Information Communication Unit]

Original Ameblo publication: 2023-11-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12829616666.html

Intellectual Property High Court, 2021 (Ne) 10088 and 2022 (Ne) 10014 [Information Communication Unit]

<Damages> Rebuttal of the presumption under Article 102(2): 15% rebutted because of competing products

* ‘Responding to individual customer requests,’ ‘securing inventory,’ ‘clearly stating maintenance-service details on the website,’ etc. do not constitute exceptional sales efforts sufficient to rebut the presumption under Article 102(2)!!

(Extract from the court's reasoning)

<Grounds for rebuttal>

On the alleged absence or weakness of the customer-attracting power of the respective inventions: As stated in Part 2, Section 3(1)(c), c(a) above, the appellant argues that effects (1) and (2) of the respective inventions, to which the original judgment attributed customer-attracting power, do not enhance that power.

However, the respective inventions can be said to have customer-attracting power in the combination of compactness and communication speed, which should be evaluated together, through the combined action of effects (1) and (2). Indeed, according to the weekly reports of the appellant's sales representatives (Otsu 54), during the appellant's development process there were instances of losing sales competitions because the product it sold before the respective defendant's products was inferior to the appellee's product in ‘compactness’ and ‘communication speed.’ The appellant's argument therefore cannot be accepted.

On the alleged lack of identity of markets: As stated in Part 2, Section 3(1)(c), c(b) above, the appellant argues that the respective defendant's products and the plaintiff's product essentially do not compete in terms of direct customers and hardly compete even at the end-user level.

However, not only are the plaintiff's product and the respective defendant's products highly interchangeable as wall-embedded information-outlet-type wireless LAN access points compatible with JIS-standard outlet plates, but of the ●●●●●●● units sold by the appellant between 2016 and 2021, ●●● ●●● units are found to have been sold to the appellee's customers (Otsu 48; Ko 78). The argument that the markets are not identical therefore cannot be accepted.

On the existence of competing products: As stated in Part 2, Section 3(1)(c), c(c) above, the appellant argues that there are products competing with the plaintiff's product other than the Ko 56 product.

Indeed, according to the evidence (Ko 78; Otsu 60-2 to 60-4 and 61), Elecom sells, in addition to the Ko 56 product, three types of JIS-compatible wall-embedded information-outlet-type wireless LAN access points that can compete with the plaintiff's product; it is well known and has price competitiveness compared with the plaintiff's product.

According to the evidence (Ko 78; Otsu 61–66), Ruijie has sold wall-embedded information-outlet-type wireless LAN access points capable of competing with the plaintiff's product since 2020; its sales were JPY 170 million in 2020 and JPY 579 million from January through November, 2021.

Meanwhile, sales of the plaintiff's product were ●●●●●●

Tokyo District Court, 2012 (Wa) 12351 [Rice Cake]

Original Ameblo publication: 2023-11-23

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12829752808.html

Tokyo District Court, 2012 (Wa) 12351 [Rice Cake]

<Damages> Patent Act, Article 102(2): 90% reduction for non-contribution (10% contribution); approximately JPY 800 million awarded

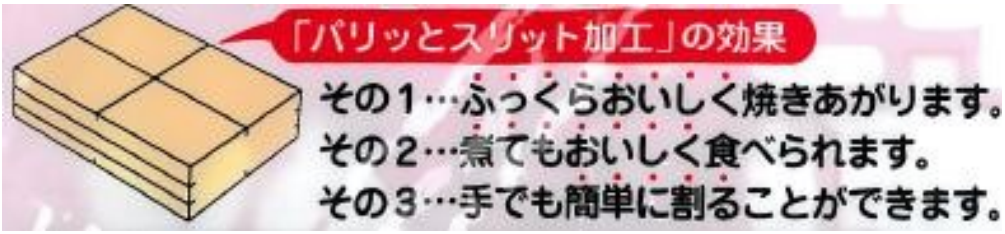
<Contribution rate>

(1) Significance of the invention (appearance of grilled rice cakes and suppression of eruption caused by sudden swelling)

(2) Advertising on the exterior packaging of the defendant's products: displaying the ‘slits made in the cut rice cakes’

(3) The defendant's securities reports, etc. describe improved performance from adding slits

(Extract from the court's reasoning)



<Contribution rate>

As to the contribution rate of the invention covered by the patent, the plaintiff argues that 15% is appropriate and the defendant argues that approximately 1–1.5% is appropriate. This issue is examined below.

The evidence establishes the following facts, and there is no reliable evidence sufficient to overturn them.

A. With cut rice cakes, which are small rectangular rice-cake pieces placed on a grilling mesh, grilled, and eaten, conventional problems included the interior rice cake suddenly swelling outward during heating and flowing downward onto the mesh. This dirtied the mesh, made the rice cakes difficult to lift off and eat, prevented uniform grilling of the whole cake and grilling many at once, and produced an undesirable finished appearance. To solve these problems, the invention adopts its stated configuration, using cuts to control (suppress) eruption caused by sudden swelling during grilling. It aims thereby to provide rice cakes that can be grilled uniformly without impairing appearance, are easy to eat and appetizing, and can in fact be enjoyed deliciously (Section 1(1)(b) above).

B. The defendant advertises the slits made in its cut rice cakes by displaying the following on the back of the exterior packaging of its products. [Ko 32-1 and 32-2]

Translation of the packaging text: Effects of “Paritto Slit” processing: (1) They grill up puffy and delicious. (2) They are also delicious when boiled. (3) They can also be split easily by hand.

C. The defendant also makes the following statements in its securities reports, etc. (Ko 77–79), and the Food Marketing Handbook contains the following statements (Otsu 219-1 to 219-9).

• ‘Overview of performance for the current fiscal year

In the packaged rice-cake division, we established production systems for the Paritto Slit type at all packaged rice-cake plants and, from September, 2004, added 700 g and 1 kg sizes to the existing 400 g size to expand sales. As a result, “Sato's Cut Rice Cakes Paritto Slit” performed steadily. However, owing to a shortage of glutinous rice caused by the poor 2003 harvest and the warm winter at the end of last year, sales declined by 3.8% year on year to JPY 12,978 million.’ [Ko 77: Securities Report (fiscal year: May 1, 2004–April 30, 2005; filed July 22, 2005)]

• ‘(1) Overview of performance for the current fiscal year

In the packaged rice-cake division, kagami-mochi sales grew as we expanded the lineup to respond to consumer purchasing trends, including “Sato's Satto Kagami Mochi,” requiring no assembly, and “Sato's Kagami Mochi with Cut Rice Cakes,” containing Paritto Slit-type cut rice cakes. In addition, “Sato's Cut Rice Cakes Paritto Slit” and “Sato's Round Rice Cakes Single Pack” performed steadily. As a result, packaged rice-cake sales increased by 0.5% year on year to JPY 13,045 million.’ [Ko 78: Securities Report (fiscal year: May 1, 2005–April 30, 2006; filed July 28, 2006)]

• ‘In the packaged rice-cake division, to further improve convenience and texture for consumers, we introduced “Paritto Slit,” which our company pioneered in the packaged rice-cake industry, into all cut-rice-cake types. We also introduced “Junjo Mochi” and “Value-Package Pounded Mochi” as products competing in the low-price range to stimulate in-store demand. However, nationwide warm-winter conditions depressed consumption, including demand for hot-pot dishes, and sales conditions during the peak year-end and New Year season remained severe. As a result, unit sales increased by 1.9% year on year, but sales value declined by 1.7% to JPY 12,819 million.’ [Ko 79: Securities Report (fiscal year: May 1, 2006–April 30, 2007; filed July 27, 2007)]

• ‘(1) Sato Foods ... launched “Paritto Slit” in 2003, with cuts allowing it to be divided into four by hand. It has gradually shifted from “Freshly Pounded Single Pack” and is putting substantial effort into this in 2004.’ ‘(2) Echigo Seika ... also saw steady performance for its “Echigo Nama Ichiban” cut rice cakes. In 2003 it launched “Fukkura Meijin,” with cuts in the sides of round rice cakes, which had been considered technically difficult, and has begun a slit-rice-cake battle with Sato Foods.’ [Otsu 219-1, second sheet]

• ‘In 2003 ... technology for putting cuts in rice cakes was developed, and rice cakes that brown even in a toaster oven without dirtying the appliance were commercialized and attracted attention. Leading manufacturers Sato Foods and Echigo Seika are increasing their focus on rice cakes with cuts.’ ‘In 2005, Sato Foods and Echigo Seika are increasing their focus on cut rice cakes with slits, and attention is being paid to whether these can become the mainstream in cut rice cakes.’ [Otsu 219-2, first sheet]

• ‘(1) Sato Foods launched “Sato's Cut Rice Cakes Paritto Slit,” processed with cuts, in 2004, and cut-rice-cake sales remained at the previous year's level ... . In 2005 it will increase its focus on “Sato's Cut Rice Cakes Paritto Slit” as a main product and expand sales channels. For kagami mochi ... it newly introduced “Sato's Kagami Mochi with Cut Rice Cakes,” containing “Sato's Cut Rice Cakes Paritto Slit,” ... seeking to recover from the previous year.’

‘(2) Echigo Seika ... in 2005 adopted cuts (“Fukkura Cut”) throughout its flagship “Echigo Nama Ichiban” line, promoting superior cooking characteristics and seeking to increase market share.’

‘Sato Foods and Echigo Seika are focusing on expanding sales of rice cakes with cuts, but many other companies are taking a wait-and-see approach. Depending on future trends in rice cakes with cuts, those with cuts are expected to become mainstream among retail cut rice cakes, and interest in them is increasing.’ [Otsu 219-2, second sheet]

• ‘(3) Kimura Foods, which focuses on commercial use, switched “Usagi Individually Packed Round Mochi” in 2008, following its cut rice cakes, to a slit-containing version made with specially cultivated rice ... . Because sales remained strong even after price revisions, the year ended with growth.’

‘The overall trend is dominated by products emphasizing convenience; slit-containing products that are easy to break and grill to an attractive appearance occupy the top three positions ... .’ [Otsu 219-6, second sheet]

• ‘Product development is progressing that emphasizes ease of eating and use, including best-before dates on individual packages and slits.’ [Otsu 219-7, first sheet]

• ‘(1) Sato Foods is advancing the switch from “Single Pack” to “Sato's Cut Rice Cakes Paritto Slit.” In 2009, promotion of the functionality of “Paritto Slit” captured demand, and the positive effect of the switch also helped performance exceed the previous year. In 2010 it is pursuing concentrated development of “Paritto Slit.” Although reduced demand caused by the extreme summer heat has had an impact, it plans to exceed the previous year's performance while promoting functionality and strengthening the brand.’ [Otsu 219-7, second sheet]

D. Considering comprehensively the facts in A through C above, particularly the significance of the invention, the content of the defendant's slit advertising, and the extent of improved performance from adding slits, as well as the facts that the patent was registered on April 18, 2008, and that the products subject to this damages claim are the defendant's products other than the representative products in the earlier case for which damages, etc. had already been sought, a 10% contribution rate for the patent relating to the invention is found appropriate in calculating damages under Article 102(2) of the Patent Act.

Tokyo District Court, 2013 (Wa) 33070 [Agricultural-Produce Sorting Apparatus] <Hasegawa>

Original Ameblo publication: 2023-11-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12829877402.html

Tokyo District Court, 2013 (Wa) 33070 [Agricultural-Produce Sorting Apparatus] <Hasegawa>

<Damages> Rebuttal of the presumption under Patent Act, Article 102(2): Invention 1, 75%; Invention 2, 95%

(1) In the defendant's equipment, sorting categories vary as appropriate according to the accumulation state, reducing overflow compared with a configuration without this feature.

(2) Profits from equipment other than the inventions are also included.

(3) The respective inventions were not tender requirements.

(Extract from the court's reasoning)

<Grounds for rebuttal>

As to the proportion in which the respective inventions contributed to the defendant's above profits, for Invention 1 the defendant asserts 2.5% and the plaintiff 50%; for Inventions 2-1 and 2-2, the defendant asserts 0.3% for Type B equipment, 0.9% for Type D equipment, and 0.2% for Type F equipment, while the plaintiff asserts 30%. They argue that the presumption under Article 102(2) of the Patent Act is rebutted for the remaining portion.

Upon examination, according to Specification 1 (Ko 2), Invention 1 concerns an agricultural-produce sorting apparatus and has technical significance primarily in providing a return conveyor and devising its terminal portion; according to Specification 2 (Ko 4), Inventions 2-1 and 2-2 concern an internal-quality inspection apparatus and have technical significance primarily in providing multiple light sources and devising light-shielding means. On the other hand, as stated in Section 1(1) above, Type B through Type E equipment adopt a configuration in which sorting categories set on the pool conveyor vary as appropriate according to the accumulation state. As a result, the number of trays containing fruit or vegetables that overflow is found to decrease compared with a configuration without this feature, and to that extent the proportion in which Invention 1 contributed to the defendant's above profits is considered reduced.

According to the evidence cited below and the entire purport of the oral argument, the following facts are also established: (1) Type B through Type F equipment comprise, in addition to sorting equipment and internal-quality inspection apparatuses, receiving equipment (excluding Type D), packing equipment, carton-sealing and product-conveying equipment, carton-forming and empty-carton-conveying equipment, and other equipment, and the profits in B above include profits from their manufacture and installation (Otsu 38–41); (2) under the tender conditions for each installation site of Type B through Type F equipment (Ko 14–18), at least placing the return conveyor's return point at the position specified in Invention 1 and providing the multiple light-emitting sources specified in Inventions 2-1 and 2-2 in the internal-quality inspection apparatus were not mandatory requirements.

In view of the above technical significance and facts, circumstances are found that rebut, for part of the above profits, the presumption that they constitute the plaintiff's damage from patent infringement. It is appropriate to find that proportion to be 75% for Invention 1 and 95% for Inventions 2-1 and 2-2.

[Design / Estoppel] Intellectual Property High Court, 2021 (Gyo-Ke) 10067 <Honda>

Whether grounds for rejection exist for a design-registration application is a matter the examiner must determine ex officio and is not subject to the binding effect of admissions.

In this case, the action to rescind the JPO decision concerned whether a right should be granted, and the applicant's change of position did not unfairly harm the interests of the administrative agency as defendant. The court therefore held that estoppel did not bar the argument.

⇒ The applicant was permitted to advance an argument about the article to which the applied-for design relates that differed from its argument before the JPO.

Osaka District Court, 2011 (Wa) 15499 [Lid and Container Equipped with the Lid]

Original Ameblo publication: 2023-12-05

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12831314773.html

Osaka District Court, 2011 (Wa) 15499 [Lid and Container Equipped with the Lid]

<Damages> Article 102(2)

Approximately JPY 32.57 million awarded

Contribution rate 15% (85% reduction)

Alternative technologies: numerous containers can hold food and be heated

⇒ Only the plaintiff's product, the defendant's respective products, and the embodiment of the Otsu 30 invention integrally mold the flap portion and lid.

(Extract from the court's reasoning)

<Contribution rate>

The parties do not dispute that, in addition to the plaintiff's product and the defendant's respective products, numerous containers exist that can hold food and heat it. However, among those integrally molding the flap portion and lid, only the plaintiff's product, the defendant's respective products, and an embodiment of the Otsu 30 invention can be established.

The respective patented inventions have technical significance in producing the effect that ‘after cooking, moisture inside the container can be discharged through the opening. As a result, the container of the invention can suitably be used for cooking pasta, etc.’ (paragraph [0023]). Considering comprehensively these circumstances concerning the availability of substitutes, the technical significance of the respective patented inventions, and all other circumstances appearing in this case, a 15% contribution of the respective patented inventions to sales of the defendant's products is appropriate.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-83697.pdf

Osaka District Court, 2011 (Wa) 6878 [Method for Stabilizing the Coloration of a Colored Plaster Composition] <Damages> Article 102(2)

Original Ameblo publication: 2023-12-06

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12831440848.html

Osaka District Court, 2011 (Wa) 6878 [Method for Stabilizing the Coloration of a Colored Plaster Composition]

<Damages> Article 102(2)

Approximately JPY 26.78 million awarded

<Grounds for rebutting the presumption> 60%

(1) Existence of competitors

(2) Features other than the invention: the defendant's catalog does not list the invention's ingredients or the accompanying uniformity and stability of coloration, prevention of uneven color, etc. as features

<Grounds for rebutting the presumption>

The invention has the effect of making the coloration of a colored plaster composition uniform and stable and preventing uneven color in the colored plaster coating formed when that composition is used. For a colored plaster composition used as a wall-coating material, this enhances usefulness and directly relates to commercial value, contributing to profits from sales of the defendant's product.

However, Patented Invention 1 is neither a product invention nor an invention of a method for producing a product, but a process invention other than a process for producing a product. Its contribution to profits from sales of the product must therefore be evaluated as low.

Features other than the invention: the website and catalog introducing the defendant's product did not list as product features the ingredients specified in the invention or the resulting effects of uniform and stable coloration or prevention of uneven color in the colored plaster coating formed when the product is used. Rather, while taking plaster's humidity-regulating function, etc. as a basis, the website and catalog emphasized features such as deodorizing through the inclusion of titanium oxide and antibacterial action through silver ions. These features also appear actually to have stimulated a certain amount of demand.

Existence of competitors

(Extract from the court's reasoning)

<Grounds for rebuttal>

Under Article 102(2) of the Patent Act, where a person infringing a patent right (or a contractually exclusive non-exclusive license) obtains profits from that infringement, the amount of those profits is presumed to be the amount of damage. However, part of that presumption is understood to be rebuttable depending on the degree to which working the patented invention contributed to those profits.

On this point, as also discussed in B above, Patented Invention 1 has the effect of making the coloration of a colored plaster composition uniform and stable and preventing uneven color in the colored plaster coating formed when that composition is used. For a colored plaster composition used as a wall-coating material, this enhances usefulness and directly relates to commercial value, and it certainly contributes to profits from sales of the defendant's Product 1.

However, Patented Invention 1 is neither a product invention nor an invention of a method for producing a product, but a process invention other than a process for producing a product. Its contribution to profits from sales of the product must therefore be evaluated as low.

The website (Ko 25) and catalog (Ko 26) introducing the defendant's Product 1 did not list as its features the ingredients specified in Patented Invention 1 or the accompanying effects of uniform and stable coloration or prevention of uneven color in the colored plaster coating formed when the product is used. Rather, while taking plaster's humidity-regulating function, etc. as a basis, the website and catalog emphasized features such as deodorizing through the inclusion of titanium oxide and antibacterial action through silver ions. These features also appear actually to have stimulated a certain amount of demand (Otsu 50–52).

Considering, in addition to the foregoing circumstances, the existence of competitors (Ko 33; Otsu 12 and 13), it is appropriate to find the presumption under Article 102(2) of the Patent Act rebutted to the extent of 60%.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-83546.pdf

Osaka District Court, 2009 (Wa) 10811 [Method and Apparatus for Manufacturing a Rotary Toothbrush] <Damages> Article 102(1)

Original Ameblo publication: 2023-12-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12831575626.html

Osaka District Court, 2009 (Wa) 10811 [Method and Apparatus for Manufacturing a Rotary Toothbrush]

<Damages> Article 102(1)

Contribution rate 10% (90% reduction)

Circumstances preventing sales: 80%

<Circumstances preventing sales> Proviso to Article 102(1)

(1) Trading relationships with numerous retailers

(2) Advertising activities

(3) Price difference

<Contribution rate>

Merely advanced the manufacturing method on the premise of a product invention

<Circumstances preventing sales> Proviso to Article 102(1): circumstances under which the plaintiff would have been unable to sell its product

The defendant can be said to have achieved that sales volume by setting a suggested retail price of JPY 500, maintaining relationships with numerous retailers, and combining these with advertising activities involving substantial expenditure.

Sales of the plaintiff's product peaked in 2003 and 16, declined in 2005–18, and by the latter year the business was showing signs of reaching an impasse.

There are structural differences: the cylindrical brush is rotatably mounted in the plaintiff's product, whereas in the defendant's product it is fixed to the brush handle.

Price difference: the defendant's suggested retail price is JPY 500; the plaintiff's retail price is JPY 1,500–3,000, considerably high for a toothbrush.

<Contribution rate>

The greatest feature of the plaintiff's product is that a rotary brush formed by stacking numerous individual brush discs is rotatably attached to the handle member. The effects of this structure, including plaque removal and prevention or improvement of periodontal disease through gum massage, as well as the aesthetic appeal of its form, distinct from ordinary toothbrushes, can be said to stimulate demand among consumers.

⇒ What the defendant infringed, however, was a patent right for inventions of methods and apparatuses for efficiently manufacturing such rotary brushes and individual brush discs without skilled techniques, and

the method invention is positioned merely as advancing the manufacturing method on the premise of a product invention. ⇒ A contribution rate of 10% for the invention is appropriate.

(Extract from the court's reasoning)

Circumstances preventing sales

Over approximately four years from November 9, 2007, the defendant transferred ●●●●●●●●●●●●●●●●●●●●●● of its products. It can be said to have achieved that sales volume by setting a suggested retail price of JPY 500 (Ko 27-2 and 27-3), maintaining trading relationships with numerous retailers (Ko 33 and 34), and combining these with advertising activities involving substantial expenditure (Ko 9; Ko 27-1 to 27-3; entire purport of the oral argument).

By contrast, the plaintiff's product had been manufactured and sold by TC Dental, whose representative director is plaintiff P1, before plaintiff T World was established on November 9, 2007 and granted the contractually exclusive non-exclusive license at issue. From that date onward, only plaintiff T World manufactured and sold it. The combined sales volumes of the two companies were approximately as follows (Ko 55). (Passage omitted)

Namely, sales of the plaintiff's product peaked at approximately ●●● units in 2003 and approximately ●●● units in 2004, and by 2005–18 had already fallen to the ●●-unit range per year; in the latter year the business was showing signs of reaching an impasse (Ko 56). Moreover, since November 9, 2007, when the contractually exclusive non-exclusive license was granted (or, indeed, since July 6 of that year, when the patent right was registered), the plaintiff's product has not been sold in retail stores (Ko 56; entire purport of the oral argument). Although TC Dental had previously advertised it (Ko 23 and 53), there is insufficient evidence of prominent advertising such as television commercials or magazine placements after that time, apart from its own website (plaintiff T World itself admits that no advertising expenses were incurred for its product).

Although the plaintiff's and defendant's products both have cylindrical brushes, they differ structurally: the plaintiff's brush is rotatably mounted, whereas the defendant's is fixed to the handle (Ko 23–25, 27-1 to 27-3, 28, 31 and 32). Moreover, although specific sales volumes are unknown, similar products can be found both among toothbrushes with rotatably mounted cylindrical brush portions like the plaintiff's product and among toothbrushes with cylindrical brush portions fixed to the handle like the defendant's product (Otsu 56–68). It is therefore difficult to find that all customers would have purchased the plaintiff's product had the defendant's product not been sold.

In addition, the plaintiff's retail price was JPY 3,000 when TC Dental sold it and JPY 1,500 even under plaintiff T World, considerably high for a toothbrush. This point alone makes it doubtful whether the same number as the defendant's product could have been sold. Plaintiff P1 himself states that the plan was ‘●●●●●●●●●●●●●●●’ (Ko 56). Thus, insofar as the damages claim assumes a high price in calculating profit per unit of the plaintiff's product, it can be said that the plaintiff should accept a finding of a smaller number that could have been sold.

In view of the foregoing, since November 9, 2007, when plaintiff T World obtained the contractually exclusive non-exclusive license, even absent the defendant's infringement of that license, there were necessarily circumstances under which the plaintiff's product could not have achieved the same volume of ●●●●●●●● units as the defendant's product. It is appropriate to find the quantity deductible for these circumstances to be ●●●●●●●● units, equivalent to 80% of the defendant's transferred quantity of ●●●●●●●● units.

Contribution rate

In examining the contribution of the patented method invention to the plaintiff's profits from its product, as plaintiff T World itself emphasizes, the product's greatest feature is that a rotary brush formed by stacking numerous individual brush discs is rotatably attached to the handle member. The effects of that structure, including plaque removal and prevention or improvement of periodontal disease through gum massage, as well as the aesthetic appeal of its form, distinct from ordinary toothbrushes, can be said to stimulate

demand among consumers. However, what the defendant infringed here was the patent right for inventions of methods and apparatuses for efficiently manufacturing such rotary brushes and individual brush discs without skilled techniques; these do not directly concern the functions of the rotary brush or individual brush discs. The plaintiff's product itself is an embodiment of an invention for which plaintiff P1 separately applied for a patent (Japanese Patent Application 2000-83736; Exhibit Hei 17 contained in Otsu 45-1; the evidence does not establish whether a decision to grant was issued). The patented method invention at issue is positioned merely as advancing the manufacturing method on the premise of that product invention. The plaintiff also registered a design for the form of its product described above (Ko 47), and the registered design is expressly identified on the product's packaging (Ko 11). As stated above, while the packaging identifies another patent entitled ‘Roll Toothbrush’ (Ko 45), it does not identify the patent at issue.

Viewed in this way, the patented method invention can be said to make a certain contribution to profits from the plaintiff's product as technology for manufacturing the individual brush discs that constitute the rotary brush, the principal part of the product, ‘efficiently, without requiring a high degree of skill and with as few steps as possible’ compared with prior art (Ko 2). Nevertheless, its contribution must be regarded as considerably lower than the contribution of the plaintiff's product itself, namely its structural features, effects, and the aesthetic appeal of its form.

Accordingly, it is appropriate to find the contribution rate of the patented method invention to be 10%.

Osaka District Court, 2011 (Wa) 3850 [Flexible Plastic Container]

Original Ameblo publication: 2023-12-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12831702139.html

Osaka District Court, 2011 (Wa) 3850 [Flexible Plastic Container]

<Damages> Article 102(1)

Approximately JPY 19.73 million awarded

Contribution rate 10% (90% reduction)

<Contribution rate>

The number of complaints concerning leaks and other problems referred to in the judgment was extremely small compared with annual sales volumes.

Even in the plaintiff's advertising, the effect of reducing pinhole risk is merely described under ‘Detailed Functional Improvements.’

<Circumstances preventing sales> Proviso to Article 102(1): circumstances under which the plaintiff would have been unable to sell its product

The parties do not dispute that, in the market for flexible plastic containers similar to the plaintiff's or defendant's product, the plaintiff's share is 30.4% and the defendant's is 28.6%.

The defendant's sales volume was within the plaintiff's capacity to work the invention, and no alternative technology for the invention has been proven.

<Contribution rate> The invention's contribution rate is 10%

No alternative technology has been proven.

Technical significance of the invention: protecting the ridge with reinforcing ribs serving particular functions and preventing pinholes.

⇒ However, compared with annual sales volumes of the plaintiff’s and defendant’s products, even the total number of complaints referred to in the judgment was extremely small.

Plaintiff's advertising: sales advertisements for its product devote a substantial proportion to the patented invention's effect of reducing pinhole risk, alongside foldability, lightness, and other measures improving container reliability. ⇒ Various factors other than pinhole risk are also considered; even the plaintiff's advertising describes the patented invention's pinhole-risk reduction under ‘Detailed Functional Improvements’ ... . Its contribution to sales should not be overestimated.

Defendant's advertising: the defendant sent customers a document entitled ‘Proposal for the Improved 20-Liter Product (20A).’ The contribution rate in the defendant's product is equivalent to that in the plaintiff's product.

(Extract from the court's reasoning)

Circumstances under the proviso to Article 102(1)

The parties do not dispute that, in the market for flexible plastic containers similar to the plaintiff's or defendant's product, the plaintiff's share is 30.4% and the defendant's is 28.6%.

However, as stated in (1) above, the defendant's sales volume is found to have been within the plaintiff's capacity to work the invention, etc.; moreover, as stated below, there is no allegation and proof sufficient to establish alternative technology for the patented invention.

Accordingly, it is appropriate to regard the defendant's product as having substituted for the plaintiff's product, which embodies the patented invention.

Contribution rate

In light of the following circumstances, a contribution rate of 10% for the patented invention is appropriate.

(1) Usefulness of the patented invention

A. Technical significance of the patented invention

(Passage omitted)

According to the foregoing, the essential feature of the patented invention is found to lie in protecting the ridge with reinforcing ribs serving those functions and preventing pinholes.

B. Availability of alternative technology

The defendant argues that the Otsu 1 invention and the invention described in Japanese Unexamined Patent Publication 1996-48364 (hereinafter the ‘Otsu 10 publication’; the invention is hereinafter the ‘Otsu 10 invention’) constitute alternative technologies for the patented invention. This argument cannot be accepted for the following reasons.

(Passage omitted)

Although the Otsu 10 invention can be said to solve a problem similar to that of the patented invention, there is insufficient evidence concerning its implementation or effects, so it is unclear whether it can substitute for the patented invention.

C. Effects of the patented invention

According to the evidence, of a total of ●●● complaints in fiscal 1995, before the plaintiff began manufacturing and selling its product in 1996, ●● concerned leakage from the folding-groove portion (Ko 26). By contrast, in fiscal 1999, ● complaints concerned leakage from the folding-groove portion, representing ●●●●% of total complaints (Ko 27-2).

These matters establish that the patented invention has a commensurate effect in solving the problem of preventing pinholes.

However, compared with annual sales volumes of the plaintiff's and defendant's products, the above number of complaints, even in total, is extremely small.

(2) Advertising by the plaintiff

According to the evidence (Ko 23-1 to 25-2), the plaintiff's sales advertising for its product devotes a substantial proportion to the patented invention's effect of reducing pinhole risk, alongside foldability, lightness, and other measures improving container reliability.

Flexible plastic folding containers themselves have a relatively simple structure, and the plaintiff has continued manufacturing and selling them for approximately forty-two years (Ko 28). The technical field is therefore considerably mature, and the patented invention is found to have commensurate value in differentiating the product from competitors under those circumstances.

On the other hand, as is clear from the content of the plaintiff's advertising, various factors other than pinhole risk are also considered when purchasing the plaintiff's or defendant's product. Even in the plaintiff's advertising, the patented invention's pinhole-risk reduction is described under ‘Detailed

Functional Improvements.’ In light of this and the discussion in (1)C above, the patented invention's contribution to sales should not be overestimated.

(3) Advertising by the defendant

According to the evidence (Ko 3), the defendant sent customers a document entitled ‘Proposal for the Improved 20-Liter Product (20A).’ The document reports an improvement from the defendant's existing product to the defendant's product having the configuration relating to the patented invention and encourages purchase.

This supports an inference that working the patented invention also contributed to sales of the defendant's product.

Even if, as stated in (3) above, various factors other than pinhole risk are considered when purchasing the plaintiff's or defendant's product, it is appropriate to regard the patented invention's contribution rate to sales of the defendant's product as equivalent to its contribution rate in the plaintiff's product.

(4) Changes in sales volumes of the defendant's product

According to Otsu 31 and 48, for the liquid container manufactured and sold under the product name ‘Baron Box,’ the defendant switched from its existing product to the product at issue and later switched back to its existing product. Sales volumes from June, 2008 to February, 2012 show no major change, but a gradual increase overall, and that trend appears unchanged even after sales of the product at issue ceased.

Intellectual Property High Court, 2011 (Ne) 10002 [Rice Cake] <Iimura> <Damages> Article 102(2)

Original Ameblo publication: 2023-12-09

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12831894367.html

Intellectual Property High Court, 2011 (Ne) 10002 [Rice Cake] <Iimura> <Damages> Article 102(2)

Approximately JPY 800 million awarded

Contribution rate 15% (85% rebutted)

<Contribution rate>

(1) Significance of the invention (appearance of grilled rice cakes and suppression of eruption caused by sudden swelling)

(2) Advertising for the defendant's products: displaying and advertising the ‘slits made in the cut rice cakes’

+ Value of the infringing portion, customer-attracting power, and consumers' motivation to select and purchase

(Extract from the court's reasoning) <Contribution rate>

As shown in the attached drawings of the defendant's products (perspective views), the defendant's products have cuts 13 formed in the long sides of the side peripheral surface 12, namely two opposing side faces. Like the invention, they are configured so that, during grilling, the portion above cut 13 rises relative to the portion below it and swells and deforms into a state in which the expanded contents are sandwiched between upper and lower grilled plate-like portions, like a monaka wafer sweet or sandwich, thereby suppressing outward eruption caused by swelling.

It is also found that the defendant (1) has sold the products under the name ‘Sato's Cut Rice Cakes Paritto Slit’ since around September, 2003, actively emphasizing in promotion and advertising that cuts in the upper, lower, and side faces of the rice cakes allow them to grill plumply; (2) from around 2005, packaged rice cakes with cuts became widely known among consumers, contributing to increased sales; and (3) from fiscal 2010, almost all its packaged rice cakes contained cuts. Taken together, these matters show that forming cuts, etc. on the side peripheral surface, which is the upright side face of a cut rice cake, and the resulting ability to grill well are connected to consumers' selection of the defendant's products (Attached Product Lists 1–5) and contribute considerably to increased sales (Ko 4, 21–26, 43, 51, 56-1 to 56-22, and 60–63; Otsu 152, 153 and 164–167).

Considering, as above, the value or importance of the infringing portion in the defendant's products (Attached Product Lists 1–5), customer-attracting power, consumers' motivation to select and purchase, etc., it is appropriate to find that the patent contributed 15% of the profits the defendant obtained from sales of those products (Attached Product Lists 1–5).

Intellectual Property High Court, 2010 (Ne) 10032 and 2010 (Ne) 10041 [Solid Golf Ball] Damages, Article 102(1)

Original Ameblo publication: 2023-12-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12831955596.html

Intellectual Property High Court, 2010 (Ne) 10032 and 2010 (Ne) 10041 [Solid Golf Ball] <Damages> Article 102(1)

Approximately JPY 921.52 million awarded

Contribution rate 50%

The proportion remaining after deduction for circumstances preventing sales was 40% in the first-instance judgment. Taking the 50% contribution rate into account as well, this judgment applied a remaining proportion of 20% (an 80% deduction).

Proviso to Article 102(1)

Highly rated for high quality, high performance, and consistent quality

ZnPCTP costs account for 1.0–4.1% of the total

A specific chemical in the core ⇒ Does not necessarily translate directly into profits on the entire product.

<Contribution rate> <Circumstances preventing sales> Proviso to Article 102(1): circumstances under which the plaintiff would have been unable to sell its products

The defendant's golf-ball products are highly rated for their high quality, high performance, and consistent quality, and their usage rate is extremely high not only worldwide but also on Japanese tours.

The plaintiff's product catalog lists ‘core technology,’ ‘cover technology,’ and ‘dimple technology’ in parallel as golf-ball technologies. Under ‘mechanism of flight,’ it also lists spin, launch angle, and dimples alongside initial ball speed.

In the defendant's golf-ball products, zinc pentachlorothiophenolate (ZnPCTP) costs account for approximately 1.0–4.1% of total product costs. ⇒ The patent, characterized by using a specific chemical in the golf ball's core, does not necessarily translate directly into profits on the entire product (golf ball).

Golf balls are said to be bundles of patents, and the plaintiff's golf balls also use many patents besides this patent. ⇒ For golf balls, not only the core but also the cover and dimples are important; performance relating to spin, launch angle, dimples, etc. is important in addition to flight performance.

⇒ The patent's contribution rate is found to be 50%. As the proportion remaining after the deduction corresponding to the quantity attributable to ‘circumstances under which [the plaintiff] would have been unable to sell,’ taking the original judgment's 40% as the basis and also accounting for the patent's 50% contribution rate, the post-deduction proportion is found to be 20%.

(Extract from the court's reasoning) <Contribution rate and circumstances under the proviso to Article 102(1)>

a. Around 2005 (2005), Acushnet Company, the first-instance defendant's parent company, held approximately 49.6% of the U.S. golf-ball market by volume and approximately 60% by value. At the same time, the first-instance plaintiff held about 40% of the Japanese market, but its U.S. share was approximately 5.6% by volume and 4.8% by value.

b. The first-instance defendant's golf-ball products are highly rated for high quality, high performance, and consistent quality, and their usage rate is extremely high not only worldwide but also on Japanese tours.

Around 2003, golf magazines also prominently advertised that the first-instance defendant's golf balls were widely used in Europe and the United States and had a high winning percentage, etc.

c. Although a golf ball is a small rubber sphere, it is said to be a bundle of patents packed with cutting-edge science and technology.

d. The invention covered by this patent aims to provide a solid golf ball with further improved flight performance and is characterized by forming the core from a rubber composition containing a specific chemical.

e. A total of 233 golf-ball-related patents held by the first-instance plaintiff or its parent, Bridgestone Corporation, remained in force during the period from January, 2003 through February, 2006.

f. The first-instance plaintiff's ‘PRECEPT LADY,’ sold in the United States around February 2005 (2005), used at least six Japanese patents corresponding to U.S. patents (including the patent at issue). Its ‘PRECEPT MC LADY’ likewise practiced seven U.S. patents of the first-instance plaintiff.

g. The first-instance plaintiff's product catalog lists ‘core technology,’ ‘cover technology,’ and ‘dimple technology’ in parallel as golf-ball technologies.

Under ‘mechanism of flight,’ the same catalog also lists spin, launch angle, and dimples alongside initial ball speed.

h. In the first-instance defendant's golf-ball products, zinc pentachlorothiophenolate (ZnPCTP) costs account for approximately 1.0–4.1% of total product costs.

(c) Because this patent, characterized by using a specific chemical in the golf ball's core, does not necessarily translate directly into profits on the entire product (golf ball), its contribution rate will be considered in applying the proviso to Article 102(1) of the Patent Act.

As stated in (a) and (b) above, in Japan's golf-ball market from 2003 through 2007, the first-instance plaintiff had the largest share and the first-instance defendant the third-largest. Assuming a market excluding the first-instance defendant, the plaintiff's share would be slightly above approximately 40%. Meanwhile, in the United States around 2005 (2005), Acushnet Company held the largest golf-ball market share and was also extremely well known in Japan through advertising, etc.

As stated above, golf balls are said to be bundles of patents, and the first-instance plaintiff's golf balls use many patents besides this patent. The patent is characterized by forming the core from a rubber composition containing a specific chemical and aims at further improving flight performance.

For golf balls, not only the core but also the cover and dimples are important; performance relating to spin, launch angle, dimples, etc. is important in addition to flight performance.

Considering all these circumstances comprehensively, the patent's contribution rate is found to be 50%. In this case, as the proportion remaining after the deduction corresponding to the quantity attributable to ‘circumstances under which [the first-instance plaintiff] would have been unable to sell,’ it is appropriate to take the original judgment's 40% as the basis and, also considering the patent's 50% contribution rate, find the post-deduction proportion to be 20%.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-82056.pdf

Intellectual Property High Court, 2010 (Ne) 10091 [Treatment Agent for Immobilizing ... Heavy Metals in Fly Ash] <Damages> Articles 102(1) and 102(3)

Original Ameblo publication: 2023-12-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12832089491.html

Intellectual Property High Court, 2010 (Ne) 10091 [Treatment Agent for Immobilizing ... Heavy Metals in Fly Ash]

<Damages> Articles 102(1) and 102(3)

Approximately JPY 1.8 billion awarded

Circumstances preventing sales were assessed by reference to competitors present in fiscal 2003–18, with quantities calculated according to market share (Article 102(3): Period 1, before sales of the plaintiff’s product; Article 102(1): Periods 2 and 3, after sales began).

Proviso to Article 102(1)

Competitors

The argument concerning the defendant’s sales efforts, including its filing of a notification at a particular time, was rejected as a circumstance preventing the patentee from making the sales.

(Article 102(3): Period 1, before sales of the plaintiff's product; Article 102(1): Periods 2 and 3, after sales began) Proviso to Article 102(1): circumstances under which the plaintiff would have been unable to sell its product

Existence of competitors: suggests competitors existed in fiscal 2003–18. ⇒ Apportioned according to market share.

The evidence does not establish what significance the defendant's sales efforts, etc. (filing a notification at a particular time) had for the subsequent formation of the market for piperazine-based products among fly-ash heavy-metal immobilization agents.

The premise that the level of the plaintiff's average unit selling price is immediately reflected in tender prices is not necessarily correct.

(Extract from the court's reasoning)

(6) Application of the proviso to Article 102(1) of the Patent Act (circumstances preventing sales) in Periods 2 and 3

A. The underlying market size

(a) In this appeal, the first-instance defendant argues that, in calculating the quantity of the plaintiff's product that could have been sold absent sales of the defendant's product, the market for all fly-ash heavy-metal immobilization agents, including non-piperazine agents (Otsu 60, 61, 64, 94 and 108), should be used as the premise.

(b) However, non-piperazine fly-ash heavy-metal immobilization agents use active chemical substances different from those in piperazine-based agents, and therefore cannot in the first place be regarded as substitutes.

In addition, it is difficult to conclude, solely from the wording of tender specifications of some waste-treatment entities, as the first-instance defendant argues, that non-piperazine fly-ash heavy-metal immobilization agents may have been sold as substitutes for the defendant's product. This is also corroborated by the fact that many tender specifications (Ko 68; Otsu 96) list only piperazine-based fly-ash heavy-metal immobilization agents as eligible products (Ko 67-1).

Accordingly, the first-instance defendant's above argument cannot be accepted.

B. Existence of competitors

(a) Market size and market shares for piperazine-based fly-ash heavy-metal immobilization agents

(1) The first-instance defendant argues that, because competitors other than the first-instance plaintiff and defendant also manufacture and sell piperazine-based fly-ash heavy-metal immobilization agents, even assuming the defendant's product had not existed in the market, the plaintiff could not have sold the entirety of the defendant's sales volume. It argues that a market excluding the defendant's product should be assumed and that, of the defendant's sales volume, the quantity corresponding to competitors' shares in that market constitutes a quantity attributable to ‘circumstances under which [the plaintiff] would have been unable to sell.’

(2) Upon examination, Article 1 of both the former Chemical Substances Control Act and the Chemical Substances Control Act effective April 1, 2004 states that their purpose is to regulate as necessary the manufacture, etc. of new chemical substances to prevent environmental contamination by substances that may harm human health. Dipotassium piperazine-1,4-bis(carbodithioate) and potassium piperazine-1-carbodithioate were designated as designated chemical substances under Article 2(4) of the former Act (Ministry of Health, Labour and Welfare, Ministry of Economy, Trade and Industry, and Ministry of the Environment Joint Public Notice No. 1 of January 9, 2004; Otsu 55). Accordingly, before that date those substances were new chemical substances under Article 3 of the former Act, and thereafter they were designated chemical substances. Both substances also constitute Type II Monitoring Chemical Substances under Article 2(5) of the Chemical Substances Control Act.

Article 23(1) of both the former and the current Chemical Substances Control Acts requires persons manufacturing or importing designated chemical substances or Type II Monitoring Chemical Substances to notify the Minister of Economy, Trade and Industry annually of the quantities manufactured and imported. Article 45(ii) of the former Act prescribes a fine of no more than JPY 100,000 for violations, and Article 45(ii) of the current Act likewise prescribes a fine of no more than JPY 300,000. Article 23(2) of both Acts provides that the Minister shall annually publish the notified quantities manufactured and imported.

As above, the accuracy of the total manufacturing and import quantities of the respective substances published by the Minister under Article 23(2) of the former or current Act is secured by criminal penalties. Those totals should therefore be regarded as accurately reflecting the market size (sales volume) of those substances in Japan.

(3) Next, there is no material directly establishing the overall market size (sales volume) of piperazine-based fly-ash heavy-metal immobilization agents using those substances, and the first-instance defendant has not submitted particularly specific evidence of competitors other than the plaintiff and defendant in the market for piperazine-based heavy-metal immobilization agents. Meanwhile, a statement by an employee of the first-instance plaintiff (Ko 67-1) states that, from April, 2006 onward, the only piperazine-based fly-ash heavy-metal immobilization agents on the market were the plaintiff's and defendant's products.

Upon examination, the total manufacturing and import quantities of those substances published in Ministry of Economy, Trade and Industry notices are found to be 5,619 tonnes in fiscal 2003 (Ko 35-1), 7,773 tonnes in fiscal 2004 (Ko 4-1), 7,586 tonnes in fiscal 2005 (Ko 4-2), 10,434 tonnes in fiscal 2006 (Ko 35-2), 7,482 tonnes in fiscal 2007 (Otsu 54-1 and 54-2), 7,893 tonnes in fiscal 2008 (Otsu 54-1 and 54-2), and 7,023 tonnes in fiscal 2009 (Ko 50). No material is available to confirm the quantity for fiscal 2010, so an accurate figure cannot be determined; for calculation purposes, the most recent fiscal 2009 quantity will be substituted. The plaintiff's and defendant's products are manufactured and sold as aqueous solutions containing those substances at an average concentration of 38%. Dividing the total notified quantity of the substances by 0.38 therefore gives a provisional market size (sales volume) for piperazine-based fly-ash heavy-metal immobilization agents based solely on the published figures.

Calculating provisional annual market sizes (sales volumes) for piperazine-based fly-ash heavy-metal immobilization agents in Periods 2 and 3 by the above method gives the figures in Column C of Attached Table 3.

Using the defendant's sales volumes found in (5)B(a) above (Column B of Attached Table 3) and the plaintiff's sales volumes established by Table 4 of Expert Report A and Ko 64 (Column A of Attached Table 3), provisional annual market shares of the plaintiff's and defendant's products in Periods 2 and 3 are as shown in Column D of Attached Table 3. Their products account for the entire provisional market in fiscal 2007 and also show high shares of ● ●●●% to ●●●●% in fiscal 2008–22. By contrast, their combined share of the provisional market in fiscal 2006 is only ●●●●%.

(4) As above, the manufacturing and import quantities of the substances published by the Minister and the market size (sales volume) of piperazine-based heavy-metal immobilization agents do not necessarily coincide. Nevertheless, the plaintiff employee's statement that only the plaintiff's and defendant's products occupied the market is corroborated for fiscal 2007 by their occupation of the entire provisional market. For fiscal 2008, their combined provisional share is high and close to those for fiscal 2009 and 22; for fiscal 2009 and 22, the statement is also corroborated by many waste-treatment entities' tender specifications listing only the plaintiff's or defendant's product as eligible products (Ko 68). The statement is therefore credible insofar as it concerns fiscal 2007–22. For those fiscal years, in which the plaintiff's product objectively shows a high market share even on the provisional figures, it is appropriate to find that only the plaintiff's and defendant's products existed in the market for piperazine-based fly-ash heavy-metal immobilization agents.

For fiscal 2006, however, the waste-treatment entities' tender specifications supporting the statement all relate to fiscal 2009 and 22, years removed from fiscal 2006, and the combined share of the plaintiff's and defendant's products in the provisional market is only 75.2%. The statement that their products occupied the entire market therefore lacks sufficient corroboration. Rather, as explained in (2) above, the accuracy of the notified manufacturing and import quantities underlying the publication is secured by criminal penalties. The above provisional share of ●●●●% for fiscal 2006 shows a significant difference from the provisional shares for fiscal 2007 onward (●●●●%–●●●%) found in (3). In the absence of sufficient evidence that large quantities of the substances were used for purposes other than fly-ash heavy-metal immobilization agents, this difference should be regarded as sufficient to infer the existence of competitors in fiscal 2006.

Fiscal 2003–17, moreover, was a period in which three OEM companies existed as competitors in the market.

Accordingly, for fiscal 2003–18, absent other reliable evidence, when considering circumstances under which the first-instance plaintiff would have been unable to sell, the manufacturing and import quantities of those substances notified to the Minister, which approximately accurately reflect the market size for piperazine-based heavy-metal immobilization agents, must be treated as corresponding to that market size.

(5) Therefore, of the defendant's sales volumes in fiscal 2003–18, after excluding quantities considered to have been sold by competitors had the defendant's product not been sold, the quantity of the plaintiff's product that the first-instance plaintiff could have sold should appropriately be the defendant's sales volume (the fiscal 2003–18 portions of Column A of Attached Table 4) multiplied by the plaintiff's market share calculated above in the market for piperazine-based fly-ash heavy-metal immobilization agents excluding the defendant's product (the fiscal 2003–18 portions of Column B of Attached Table 4). The resulting quantities appear in the fiscal 2003–18 portions of Column F of Attached Table 4.

For fiscal 2007–22, by contrast, as stated above, only the plaintiff's and defendant's products are found to have existed in the market for piperazine-based fly-ash heavy-metal immobilization agents. The existence of competitors therefore cannot be found as a circumstance under which the first-instance plaintiff would have been unable to sell its product.

Tokyo District Court, 2008 (Wa) 2944 [Normally Closed Flow-Control Valve] <Damages> Article 102(2)

Original Ameblo publication: 2023-12-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12832384709.html

Tokyo District Court, 2008 (Wa) 2944 [Normally Closed Flow-Control Valve] <Damages> Article 102(2)

Approximately JPY 396.20 million awarded

Contribution rate 40% (60% reduction)

<Contribution and grounds for rebutting the presumption>

Alternative technology: pressure-type control devices and thermal-type flow-control devices fundamentally differ in their underlying approach to flow control; one is not an improved version of the other, and their characteristics each have advantages and disadvantages. Users therefore choose the method best suited to what is to be controlled, considering each device's features. As stated above, many features of the defendant's product that the defendant invokes could also have been accommodated by the plaintiff in a mass-flow controller if customers had requested similar specifications.

(Extract from the court's reasoning) <Contribution and grounds for rebutting the presumption>

... As above, pressure-type control devices and thermal-type flow-control devices fundamentally differ in their underlying approach to flow control; one is not an improved version of the other, and their characteristics each have advantages and disadvantages. Users can therefore be said to choose the method best suited to what is to be controlled, considering each device's features. As stated above, many features of the defendant's product that the defendant invokes are found to have been capable of accommodation by the plaintiff even in a mass-flow controller if customers had requested similar specifications.

(Passage omitted)

Considering comprehensively the circumstances found in Section 8 above, a 40% contribution of the invention to sales of the defendant's product is appropriate.

The defendant argues, by contrast, that (1) its product was jointly developed with its customer; (2) it has features absent from the plaintiff's product (flow control using a pressure sensor); and (3) the plaintiff had no sales history with that customer, which had previously purchased mass-flow controllers from companies other than the plaintiff. On these grounds, it argues that even absent infringement, there was no possibility that the plaintiff could have sold its product to the defendant's customer and that the plaintiff did not suffer damage equivalent to the profits from sales of the defendant's product. However, in light of the circumstances found in Section 8 above, it cannot necessarily be said that the defendant's product is superior to the plaintiff's, or that competitors' products are superior to the plaintiff's and the defendant's customer would have purchased a competitor's product if the defendant's product had not been sold. Such circumstances cannot be established. Accordingly, circumstances rebutting the presumption under Article 102(2) of the Patent Act are not found in this case.

Osaka District Court, 2007 (Wa) 13513 [X-Ray Foreign-Matter Inspection Apparatus] <Damages> Article 102(2)

Original Ameblo publication: 2023-12-13

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12832385120.html

Osaka District Court, 2007 (Wa) 13513 [X-Ray Foreign-Matter Inspection Apparatus] <Damages> Article 102(2)

Approximately JPY 371.50 million awarded

Contribution rate 20% (80% rebutted)

(1) An important function for maintainability, but an ancillary function.

(2) The defendant has the leading 48% share of the X-ray foreign-matter inspection apparatus market and a comprehensive support system.

The invention concerns the very support structure for the conveying mechanism and line sensor, important components of an X-ray foreign-matter inspection apparatus, and is indispensable to the overall structure of the defendant's product.

In its product pamphlet, the defendant emphasizes ‘cleanability,’ stating that the apparatus ‘can be easily disassembled and washed with water,’ in relation to easy maintenance, an effect of the patented invention.
⇒ The invention, which directly relates to the belt conveyor's cleanability, should be regarded as making a considerable contribution to sales of the defendant's product. However, the product's primary function is to inspect food for foreign matter using X-rays; although maintainability is important, it is only ancillary. The patented invention's contribution is therefore assessed within the limits of that ancillary function.

Defendant's sales capabilities: its leading 48% share in the X-ray foreign-matter inspection apparatus market and comprehensive support system contribute commensurately to sales of its product.

Competitor activities: the exclusivity of a patent right (Patent Act, Article 68) is a special legal effect, and unauthorized working by competitors does not diminish it.

Rather, because, as the defendant argues, competitors such as Anritsu, Nissin Electronics, and System Square practice the patented invention, the invention is found highly useful in X-ray foreign-matter inspection apparatuses, with no readily substitutable alternative technology.

(Extract from the court's reasoning)

(a) Position of the patented invention in the defendant's product

The patented invention concerns the very support structure for the conveying mechanism and line sensor, important components of an X-ray foreign-matter inspection apparatus, and is found indispensable to the overall structure of the defendant's product.

Regarding easy maintenance, an effect of the patented invention, the defendant's product pamphlets (Ko 5 and 15) emphasize ‘cleanability,’ stating that the apparatus ‘can be easily disassembled and washed with water.’ The defendant's product principally inspects food, and food-related machinery must always be kept hygienic, particularly conveyors carrying food. The defendant's instruction manual also recommends daily cleaning: ‘After finishing operation for the day, clean each part of the conveyor.’ Accordingly, the patented invention, which directly relates to the belt conveyor's cleanability, should be regarded as making a considerable contribution to sales of the defendant's product.

However, the defendant's product primarily functions to inspect food for foreign matter using X-rays; although maintainability is an important function, it is only ancillary.

The patented invention's contribution should therefore also be assessed within the limits of that ancillary function.

(b) Availability of alternative technology

The defendant argues that the configuration of the publicly used apparatus is an alternative technology to the patented invention. Admittedly, the technical idea of facilitating maintenance can also be perceived in that apparatus. However, its solution is to support the conveyor unit constituting the conveying mechanism with a member separate from the support member of the main body of the X-ray foreign-matter inspection apparatus, and then pull the unit forward, which differs greatly from the patented invention. Although in Otsu 6 and Otsu 13 the defendant shows cleaning without pulling the conveyor unit forward, the publicly used apparatus's instruction manual (Ko 9, p. 126) states that the conveyor unit is to be pulled out as part of the conveyor-cleaning procedure (despite being the seller of the publicly used apparatus, the defendant shows a maintenance procedure different from its manual). Thus, the means of solving the problem of easy maintenance in the publicly used apparatus should be regarded as pulling the conveyor unit forward. Because the apparatus adopts that structure, it requires correspondingly more work and must be regarded as inferior to the patented invention in maintainability.

Accordingly, although the publicly used apparatus has a configuration facilitating maintenance, it cannot be found to be an alternative technology readily substitutable for the patented invention.

(c) Defendant's technical capabilities

The defendant argues that its product sells because of technical elements other than the patented invention, specifically citing that the space below its conveyor is open and easy to clean.

However, the defendant's pamphlets (Ko 5 and 15) say nothing about that effect. The defendant also points out that the space below the plaintiff's product is not open, but according to the plaintiff's pamphlets (Ko 20, p. 2; Ko 21, p. 3), opening the inspection-chamber door also permits easy cleaning beneath the conveying mechanism in the plaintiff's product. Taking into account as well that daily cleaning is recommended for food-related X-ray foreign-matter inspection apparatuses, it is difficult to regard the open space below the defendant's conveyor as a major selling point.

The defendant also argues that its product sells because of ‘missing-item inspection accuracy,’ ‘durability,’ and ‘ease of handling,’ but there is insufficient evidence to establish this.

(d) Defendant's sales capabilities

The entire purport of the oral argument establishes that X-ray foreign-matter inspection apparatuses are used before or after computer scales, checkweighers, etc. on the same line; that sales capabilities for those peripheral devices led to opportunities to sell X-ray foreign-matter inspection apparatuses; that the defendant has the leading 48% share of the market; and that the defendant maintains a comprehensive support system. These facts are found to contribute commensurately to sales of its product.

The plaintiff argues on this point that the defendant was able to secure a position in the field of X-ray foreign-matter inspection apparatuses because the plaintiff and defendant cooperated closely and inseparably. However, whether the plaintiff contributed to establishing the defendant's sales network is basically unrelated to assessing the patented invention's contribution to sales of the defendant's product, and the argument cannot be accepted.

(e) Competitor activities

The defendant argues that competitors such as Anritsu practice the patented invention in the X-ray foreign-matter inspection apparatus market, and that the patented invention lacks deterrent force and therefore has no exclusive value.

However, the exclusivity of a patent right (Patent Act, Article 68) is a special effect granted by law, and unauthorized working by competitors does not diminish that legal effect.

Rather, because, as the defendant argues, competitors such as Anritsu, Nissin Electronics, and System Square practice the patented invention (the parties do not dispute this fact here, so it is taken as a premise), the invention is found highly useful in X-ray foreign-matter inspection apparatuses, with no readily substitutable alternative technology.

(f) As above, although the patented invention does not concern the primary function of an X-ray foreign-matter inspection apparatus, it is highly useful for maintainability, an important function for food-handling equipment, and no readily substitutable alternative technology is found. Considering also that the patented invention is structurally indispensable to the defendant's product, even accounting for the defendant's sales network's contribution to sales, a contribution rate of 20% for the patented invention is appropriate.

Tokyo District Court, 2003 (Wa) 19926 [Coagulant Composition for Tofu] <Damages> Article 102(1)

Original Ameblo publication: 2023-12-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12832479061.html

Tokyo District Court, 2003 (Wa) 19926 [Coagulant Composition for Tofu] <Damages> Article 102(1)

Approximately JPY 152.29 million awarded

<Circumstances preventing sales> Proviso to Article 102(1): none

⇒ In light of the rapidly expanding demand for emulsified nigari products for tofu, etc., it cannot be said that the plaintiff's product and the defendant's respective products lack a complementary relationship.

(Extract from the court's reasoning)

The defendants argue, as circumstances under the proviso to Article 102(1) of the Patent Act, that (1) demand for their respective products arose from the products' own characteristics and the defendants' sales efforts, and (2) defendant Kawa Shoji supplies the respective products only through the sales channels of Hoshitaka Co., Ltd., to which the plaintiff ceased supplying. They therefore argue that the plaintiff's product and their products have no mutually complementary relationship.

However, even all the evidence in this case does not establish the circumstances concerning transactions between Hoshitaka Co., Ltd. and the plaintiff. In light of the fact that, since April, 1998, demand for emulsified nigari products for tofu has rapidly expanded among major mass-production tofu manufacturers (Ko 8-1 and 8-2), etc., it cannot be said that the plaintiff's product and the defendants' respective products lack a complementary relationship. Nor is there other sufficient evidence of facts supporting the defendants' assertions, which therefore cannot be accepted.

Intellectual Property High Court, 2022 (Gyo-Ke) 10125 <Hibiku Shimizu>, Disclaimer Claims and Correction Requirements

Original Ameblo publication: 2023-12-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12833371802.html

Intellectual Property High Court, 2022 (Gyo-Ke) 10125 [Composition Containing 2,3-Dichloro-1,1,1-Trifluoropropane, 2-Chloro-1,1,1-Trifluoropropene, 2-Chloro-1,1,1,2-Tetrafluoropropane, or 2,3,3,3-Tetrafluoropropene] <Hibiku Shimizu>

Disclaimer Claims and Correction Requirements

(1) Excluding only the portion identical to an earlier-filed invention or prior art is not a correction requirement.

(2) The court found that the correction excluded a portion likely to be assessed as substantially identical to prior art relied on for grounds of invalidity based on lack of novelty and inventive step.

⇒ An impact on correction requirements?

(1) was held for the first time!!

Assessment of the holding in (2) may stir controversy ...

(Extract from the court's reasoning)

... When correcting the claims, ... there is no requirement to exclude only the portion identical to an earlier-filed invention or only the portion identical to prior art publicly known before the patent application. Where a correction is made ‘within the scope of matters described in the specification, claims, or drawings,’ that is, where it introduces no new technical matter in relation to the original technical matters, it is difficult to envisage unforeseen harm to third parties from the correction. It should therefore be said to be inappropriate to add requirements of the kind asserted by the defendant when interpreting the correction requirements of that paragraph.

The defendant also argues that the content of a corrected invention cannot be freely defined in the form of a disclaimer claim. The correction at issue ... followed an advance notice of a trial decision finding invalidity grounds of lack of novelty and inventive step based on Ko 4. However, ... Ko 4 states ... ‘This concerns an advantageous method of directly preparing ... hydrofluorocarbons from a halocarbon mixture containing HCFC-225cb. ... The method is performed without converting a substantial quantity of that HCFC-225cb into other compounds’ ([0012]) and ‘A preferred mixture according to the invention is a mixture containing the compound HCFC-225cb. In another preferred embodiment, the mixture consists essentially of approximately 1 to approximately 99 weight percent HCFC-225cb ...’ ([0015]). In light of those passages, the correction can be said to seek to exclude the portion likely to be assessed as substantially identical to the invention described in Ko 4. It therefore cannot be said to freely define the corrected invention's content independently of the prior-art invention described in Ko 4.

Intellectual Property High Court, 2015 (Gyo-Ke) 10190 [Method for Reducing Environmental Pollutants in Oils or Fats] <Tsuruoka>

* Replacing some steps of the cited invention with well-known technology would leave two of its three problems unsolved.

⇒ There is a reason not to make the proposed substitution!!

★ For a patentee, it is strategically advantageous to argue that the primary reference solves multiple problems!!

(Extract from the court's reasoning)

The Ko 1 ... invention ... requires, to solve the problems in D(1) and D(3), ‘performing selective transesterification using lipase to generate an oil composition containing fatty-acid esters,’ followed by molecular distillation to obtain a residual glyceride fraction substantially free of undesired saturated and monounsaturated fatty acids. Replacing this step with ‘externally adding a volatile working fluid to the oil composition’ followed by molecular distillation might solve the problem in ... D(2), but could not solve the problems in ... D(1) and D(3). Thus, adopting in the Ko 1 ... invention the well-known configuration of ‘externally adding a volatile working fluid to the oil composition’ in place of ‘performing selective transesterification using lipase to generate an oil composition containing fatty-acid esters’ would mean deliberately replacing a configuration essential to solving the invention's problems with another that cannot solve them. A person skilled in the art has no motivation to make such a replacement; rather, there is a reason not to make that substitution ... .

The Ko 1 ... invention ... should be regarded as premised on solving the problems in D(1) through D(3) even without ... optional, additional steps, and for that purpose the configuration of ‘performing selective transesterification using lipase to generate an oil composition containing fatty-acid esters’ is indispensable ... . Even considering the existence of subsequent steps does not alter the above ... determination ... .

Original Ameblo publication: 2023-12-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12834554708.html

Intellectual Property High Court, 2008 (Gyo-Ke) 10366 [Gastritis Treatment Agent] <Iimura>

* Criteria for assessing inventive step of second-medical-use inventions

* Post-filing literature and opinion letters contradicting the alleged obstacles were also examined as evidence of common general technical knowledge at the filing date!!

⇒ Inventive step denied

'... Post-filing literature and opinion letters ... also contain the view that ... ; throughout the period before and after filing, there was no established view that gastric ulcers and gastritis differ in their pathology and mechanisms of onset ... .'

(Extract from the court's reasoning)

[Claim] A therapeutic agent for gastritis caused by reflux of bile acids into the stomach, comprising ... as an active ingredient

For an invention concerning use of a substance, it goes without saying that whether a newly discovered property (use) could readily have been conceived by a person skilled in the art should be determined on the basis of publicly known technology and common general technical knowledge in the invention's field. In this case, where efficacy as a 'gastric-ulcer treatment agent' was known before filing, whether a person skilled in the art could readily conceive the technical idea that it also has efficacy as a 'gastritis treatment agent' should be determined by comprehensively considering (1) whether gastric ulcers and gastritis differ in pathology and mechanisms of onset; (2) whether gastric-ulcer and gastritis treatment agents differ in mechanisms of action; (3) comparison and examination of other drugs effective for both gastric ulcers and gastritis; and (4) whether factors discourage applying the compound to gastritis treatment, etc. ...

At the time of filing ... acute gastric mucosal lesions appear to have begun being identified as a cause of acute gastritis, but attacks on normal mucosa through gastric-juice irritation were also identified for gastric ulcers. It cannot be found that their pathologies or mechanisms of onset were recognized as clearly distinct. Post-filing literature and opinion letters show changes in gastritis classification after the discovery of H. pylori, but regarding the relationship between gastric ulcers and gastritis, some take the view that gastric ulcers are advanced gastritis (Otsu 8), while others, such as the plaintiff's opinion letter, take the view that they differ in their mechanisms of onset (Ko 52). It should therefore be said that, throughout the period before and after filing, there was no established view that gastric ulcers and gastritis differ in pathology and mechanisms of onset. Accordingly, it is difficult to find that, at the filing date, persons skilled in the art recognized gastric ulcers and gastritis as different in pathology and mechanisms of onset and their therapeutic agents as different in mechanisms of action.

<New YouTube Video> [Patents] IP Strategy That Serves Business (Publicly Releasable Extracts from a Five-Hour Paid Lecture / Two Hours)

★ More than half of the material was cut because it was unsuitable for general release, so there are places where the speech jumps. Thank you for your understanding.

https://www.youtube.com/watch?v=jXGvy82Ihvg

<Contents>

1. Introduction — IP Landscaping

2. Overview of the Patent System (+ IP Landscaping) (‘Open/Closed Strategy’ omitted)

⇒ IP that decision-makers should understand in light of the Corporate Governance (CG) Code

IP that decision-makers should understand in light of the CG Code — Viewing IP as an ‘asset.’

IP due diligence: ‘Intellectual Property Due Diligence Standard and Commentary’ (Japan Patent Office, March, 2018)

3. Strong (Patentable) Inventions (Pioneering Inventions) = Initial Specifications Enabling Divisional Applications That Capture Future Accused Products

4. Patent-Filing Strategies by Technical Field (IT, Pharmaceuticals and Biotechnology)

5. Important Judgments, Etc. at the Patent-Strategy Level + Important Points on IP Other Than Patents

Co-ownership of patent rights: laws of various countries

Doctrines permitting refusal to produce materials in U.S. litigation discovery

(1) Attorney-client privilege

(2) Work-product doctrine

‘Evidence gathering’ using U.S. courts <28 U.S.C. § 1782>

Presumption of negligence (Patent Act, Article 103)

Patent rights and competition law

Divisional-application strategy (Patent Act, Article 44)

Advantages and disadvantages of numerical-limitation / parameter inventions: how to describe the invention's problem in the initial specification

Prior-user rights (denial of ‘encroachment’)

Second requirement of the doctrine of equivalents

Multiple actors — Comparison of Japanese and U.S. exhaustion doctrines

Personal liability of (nominal) directors — Overseas servers and domestic working

[Trademarks] The Mon Chouchou and Takoyaki Kobo cases

[Unfair Competition Prevention Act] Criminal trade-secret infringement cases, the three trade-secret requirements, dissemination and notification of false facts,

[Copyright] Essential wording in copyright contracts — IP combinations (trademark + design) (patent + design)

[Designs] Non-publication after rejection, partial designs, converted applications, related designs, image designs, protection of ‘functions,’ and similarity between the accused product and designs made public after filing,

6. ‘Resolution’ of the Invention (★) ⇒ ‘Resolution of the invention described in the specification’ in light of patentability requirements

7. Filing Strategies That Preserve Room (‘Option Rights’) to Obtain Rights to Another Invention After Filing and After Seeing Competitors' Products, While Maintaining Priority of the Filing Date (★) ⇒ Divisional-application strategy (‘addition of new matter’ in judicial decisions) ⇒ Filing strategies with foreign filings in mind (devising the specification of the priority application / practice in various countries)

8. Other Techniques to Maximize Patent-Application Value (A Wide Variety of Small Techniques)

(1) Reasons for rejection and amendments to claim wording: devising prosecution responses!!

(2) Utilizing dependent claims: claim differentiation

(3) Functional claims: worth considering as independent claims in every case!!

(4) Subcombination claims: among the cases discussed in the lecture, no infringement claim was unsuccessful because of a difference in intended application

(5) Specifying ‘use’ and ‘manner of use’: among the cases discussed in the lecture, only one case in which a difference in the specified use led to an unsuccessful infringement claim

(6) Disclaimer claims: inventive step upheld by excluding an essential element of the primary reference!!

(7) Numerical-limitation and parameter inventions: paired with a new ‘problem’!!

(8) Incorporating effects into claims: the ultimate technique when obviousness of the configuration cannot be avoided

(9) Manufacturing-method inventions

(10) Using separate applications

(11) Terms expressing degree

(12) Anticipating indirect and multiple-actor infringement (reviewing system claims)

Intellectual Property High Court, 2013 (Gyo-Ke) 10209 [Agent for Suppressing Vascular Intimal Thickening] <Shimizu>

Original Ameblo publication: 2023-12-31

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12834656128.html

Intellectual Property High Court, 2013 (Gyo-Ke) 10209 [Agent for Suppressing Vascular Intimal Thickening] <Shimizu>

* The claim describes an ‘agent’ having specified effects, rather than directly specifying its use as an ‘agent for suppressing vascular intimal thickening’!!

(Incorporating effects into the claim)

[Author’s comment] ⇒ It is a use invention in the sense of ingestion into the human body, but might its technical scope not be limited to pharmaceuticals?

‘In particular, the ACE-inhibitory activity of IPP and VPP is considerably lower than that of the above ACE inhibitors ... ; therefore, selecting ... them for testing is not readily conceivable ... .’

(Extract from the court's reasoning)

[Claim 1] An agent comprising ... Ile Pro Pro and/or Val Pro Pro as an active ingredient and having at least one of the actions of improving vascular endothelial function and suppressing vascular intimal thickening

At the priority date, although there were examples in which ACE inhibitors exhibited an action improving vascular endothelial contraction and dilation or suppressing vascular intimal thickening, it could not be said that ACE inhibitors generally possessed at least one of those actions. Persons skilled in the art are found generally to have understood that whether individual ACE inhibitors actually had those actions could only be known by confirming them through separate experiments. ... IPP and VPP differ greatly in properties and structure from the above ACE inhibitors, and, in particular, their ACE-inhibitory activity can be said to be considerably lower. Selecting IPP and/or VPP for testing is therefore not readily conceivable ... .

I came to the office after reading that 14.3% of entrepreneurs work on New Year's Day, but… at 1:30 p.m. I was the first person to enter the building 😅 (The building management office was staffed. Thank you for your hard work.) I will start working on my manuscript for the journal Patent.

Happy New Year January 1, 2024

Original Ameblo publication: 2024-01-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12834863078.html

Happy New Year. In 2023, I somehow managed to achieve the goals I set at the beginning of the year.

This, too, was the result of the good opportunities and connections that all of you gave me. Thank you so much for your support.

In 2024, in addition to professional achievements, scholarly articles, and daily posts, as in the previous year, my goal is to make exercise a habit!

I will stay healthy in both body and mind and contribute to the smooth functioning of patent practice in Japan!!

Tokyo District Court, 2018 (Wa) No. 28930 [Laser Processing Apparatus] <Nakashima>

IP High Court, 2023 (Ne) No. 10030 <Claim for Registration of Transfer of Patent Rights> ⇛ Plaintiff loses

Original Ameblo publication: 2024-01-04

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12835209850.html

2023 (Ne) No. 10030 <Claim for Registration of Transfer of Patent Rights>

⇒ Plaintiff loses

After leaving employment, A filed a patent application in the name of a company A had founded.

At the time of completion of the inventions alleged by the appellant (around May 2018), the former company's work rules provided for transfer of the rights at the company's request in return for payment of an amount determined through consultation; no agreement providing for original vesting of the rights in the company was established.

⇒ The later employee-invention regulations providing for original vesting were alleged to apply retroactively. The court held, however, that even if the regulations had been validly adopted, they could not change the original ownership of rights to obtain patents that had already arisen.

*Would there also be no negligence even if a damages claim were brought!?

[Unfair Competition Prevention Act / Trade Secret Infringement Offense / Criminal] Nagoya District Court, 2017 (Wa) No. 427

Original Ameblo publication: 2024-01-06

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12835536632.html

[Unfair Competition Prevention Act / Trade Secret Infringement Offense / Criminal] Nagoya District Court, 2017 (Wa) No. 427

The defendant was a former employee of Aichi Steel and founded MagneDesign.

⇒ Acquitted (the prosecutor abandoned an appeal)

The defendant's explanation to a third party was excessively abstracted and generalized, amounting only to a combination of commonplace methods.

⇒ The non-public-knowledge requirement was not met (intent was also negated).

(Excerpt from the court's reasoning)

“Although the information that the two defendants explained to e at the meeting in question concerned a process for aligning amorphous wires on a substrate, there are substantial differences in important parts of the process from the structure of the wire-alignment apparatus owned by b and the process for aligning amorphous wires on a substrate using that apparatus. Moreover, in the portions of that information corresponding to the process asserted by the prosecutor, the measures for arranging wires precisely on a substrate in light of the characteristics of amorphous wire had been stripped away. The information was excessively abstracted and generalized and, even when viewed as a single integrated sequence of operations, amounted merely to selecting and combining commonplace methods. It cannot be said that it was not generally known or could not readily be learned. Thus it cannot be said to satisfy the non-public-knowledge requirement among the three requirements for a trade secret (management as a secret, usefulness, and non-public knowledge). Accordingly, it cannot be said that the two defendants disclosed b's trade secrets at the meeting in question.

Furthermore, even if one were to adopt the view that the two defendants' conduct objectively constituted disclosure of a trade secret (this assumption does not represent this court's view), the possibility remains that the two defendants believed that the information they explained to e at the meeting did not constitute b's trade secrets. In light of this and the fact that there were reasonable grounds for that belief, the two defendants cannot be held liable for an intentional offense.

Accordingly, both defendants are acquitted.”

Osaka District Court, 2017 (Wa) No. 4178 <Takemiya> [Belt for a Shoe Press] Public use ⇛ Lack of novelty

Original Ameblo publication: 2024-01-09

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12835874853.html

Judgment of January 31, 2023: Osaka District Court, 2017 (Wa) No. 4178 <Takemiya> [Belt for a Shoe Press]

It was possible to focus on the curing agent contained in a product that had been publicly used.

⇒ No novelty

Is this the same benchmark as “it could have been learned by disassembling and analyzing it by ordinary methods” (2015 (Gyo-Ke) No. 10069, [Rod-Shaped Light] <Shitara>)?

⇒ An important judgment to watch, sharing an approach with the IP High Court judgment on prior-use rights, 2017 (Ne) No. 10090 <Presiding Judge Takabe>!!

For Invention 2 in this case, the surface roughness (Ra) of the drainage-groove walls in the defendant's product must fall within the numerical range along the entire length of the grooves!

⇒ Claim limitation not satisfied

★ According to this judgment, “literally” requires that the drainage-groove walls fall within the numerical range along the entire length of the grooves, and language permitting exceptions is needed in the claim wording or the specification…

(Excerpt from the court's reasoning)

The plaintiff argues that even if Belt B was delivered to Nippon Paper, it cannot be said that it would have been possible to identify the presence of DMTDA as a curing agent in Belt B's outer peripheral surface. The plaintiff points out that it is impossible to determine from the physical belt itself how many layers constitute the belt, and so forth; that because the polyurethane constituting the belt consists of various chemicals, it cannot be said that an analysis focusing on the curing agent contained in the polyurethane forming the outer peripheral surface would have been performed; and that, at the time, there were an extremely large number of candidate substances for a curing agent, and even a person skilled in the art did not know that the use of Ethacure 300 could suppress cracking, so it is wholly implausible that someone would have focused on DMTDA as the curing agent, gone out of their way to obtain it, and sent it to an analytical laboratory as a sample with a request for analysis. However, … Belt B was delivered to Nippon Paper and placed in a condition in which it could freely be analyzed and the like. In addition to the fact that its structure and other features could be identified through analysis and the like…, before the filing of Patent 1 in this case, Ethacure 300 had attracted attention and had been put into practical use as a curing agent for urethane. Even if the mass spectrum of DMTDA had not been registered in an analytical laboratory's library…, it can be said that there was a probability that Ethacure 300 would have been sent to an analytical laboratory as a sample with a request for analysis. It is therefore found that a person skilled in the art could have learned the content of Publicly Worked Invention B. …

<IP LAB> Attorney Hideki Takaishi's Patent Channel ② — Inventive Step of Parameter Inventions

Original Ameblo publication: 2024-01-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12836020741.html

<IP LAB> Attorney Hideki Takaishi's Patent Channel ②

Inventive Step of Parameter Inventions

Unlike the Examination Guidelines, courts tend to treat a parameter and its range as matters defining the invention and to recognize an inventive step unless their obviousness is demonstrated. As discussed in detail below, where a new parameter is related to solving the invention's problem, obviousness is more likely to be denied (and inventive step affirmed). Viewed from another perspective, where the invention's problem, effects, or technical significance are not described in the specification, or are unrelated to the parameter, the parameter is more likely to be regarded as a matter of design choice. In that sense, the relationship between the parameter and the invention's problem, effects, and technical significance is the central issue.

https://www.takaishihideki.com/_files/ugd/324a18_ed5f0d7975c342ecb2530c6041d32cc5.pdf

https://www.youtube.com/watch?v=MnJC0emQ7Ho

1. Correlation between the invention's problem and the parameter, and inventive step (general principles)

Where there is a correlation between solving the invention's problem and the parameter in question, technical significance is recognized in the parameter. If the correlation is one-to-one, the parameter can be said to have high technical significance. On the other hand, if the relationship is one-to-n, or is an indirect, weak correlation, its technical significance is lower and inventive step tends to be harder to establish (obviousness is more readily found). In other words, although the proposition to be assessed in determining inventive step is the obviousness of the parameter and its range, the tendency is to evaluate the technical significance of the parameter itself according to the degree of correlation with the invention's problem, and to apply a different threshold for obviousness accordingly.

Accordingly, how the invention's problem is identified is one of the most important issues in an inventive-step assessment and can determine the outcome. The Pyrimidine Grand Panel judgment established the principle (in the context of the support requirement) that the assessment should be based on the description in the specification. The Examination Guidelines take the same approach, allowing reference to external evidence as an exception where an amendment or divisional application has shifted the problem from the one described in the specification.

2. Conditions under which a parameter invention satisfies inventive step

Where numerical values are the only difference between a parameter invention and the cited reference, numerous court decisions have found inventive step if both ① and ② below are satisfied. (In other words, it depends on how the invention's problem is framed.)

① There is a correlation between solving the invention's problem and the parameter (throughout the entire numerical range).

② The invention's problem is neither publicly known nor obvious.

OR

Even if the invention's problem is publicly known or obvious, focusing on the parameter as a factor contributing to the solution of that problem is neither publicly known nor obvious.

⇒ Conversely, where ① the invention's problem cannot be read from the specification in question and cannot be identified, or ② the parameter and the invention's problem (operation and effects) are not correlated (there is no description in the specification), or, even if they are correlated, the parameter was publicly known or could have been focused on, numerous court decisions have held the numerical values themselves to be a matter of design choice, etc. (*This category corresponds to “qualitatively different effects” in the Examination Guidelines.) Very few court decisions have affirmed inventive step by finding critical significance in the numerical range, effects that are of the same kind but remarkable, or unforeseeable remarkable effects.

Examples of decisions denying novelty or inventive step where the setting of a parameter was treated as a matter of design choice or a similar matter, and the parameter and the invention's problem (operation and effects) were not correlated (or no such correlation was described in the specification), include IP High Court, 2021 (Gyo-Ke) No. 10096, [Light Source] <Presiding Judge Honda>; IP High Court, 2021 (Gyo-Ke) No. 10135, [Vectors Containing Stuffer/Filler Polynucleotide Sequences] <Presiding Judge Kanno> (lack of novelty of Claim 30); and 2010 (Gyo-Ke) No. 10296, [Petrolatum-Based Nasal Ointment] <Presiding Judge Takizawa> (= 2006 (Gyo-Ke) No. 10132, 2005 (Gyo-Ke) No. 10665, 2005 (Gyo-Ke) No. 10754, and 2005 (Gyo-Ke) No. 10189). Outside parameter inventions, examples include IP High Court, 2022 (Gyo-Ke) No. 10111, [Beltline Molding for a Vehicle Door] <Presiding Judge Honda>.

There are also decisions recognizing inventive step on the ground that it was not obvious in which direction, or by how much, to change a parameter (2020 (Gyo-Ke) No. 10044 <Presiding Judge Otaka>, 2019 (Gyo-Ke) No. 10011 <Presiding Judge Takabe>, 2015 (Gyo-Ke) No. 10206 <Presiding Judge Takabe>, etc.). However, these are exceptional, and one should not rely on them.

⇒ Regarding “unforeseeable remarkable effects,” apart from the facts of the Supreme Court's Doxepin judgment (2018 (Gyo-Hi) No. 69), there are extremely few court decisions in which an invention with an obvious configuration was nevertheless found inventive because of its effects.

Considering that JPO trial/appeal decisions finding inventive step based on unforeseeable remarkable effects are liable to be overturned by the IP High Court, it is preferable to argue a difference in the problem, rather than the effects, from the JPO trial/appeal stage. (*Naturally, it is a different matter where an originator pharmaceutical manufacturer seeks a decision upholding validity in connection with patent linkage.)

3. Where multiple parameters are correlated with solving the invention's problem

Where the primary reference has multiple parameters, if the issue is whether changing only one of them would have been obvious, it is necessary to demonstrate the rationale for being able to change that one parameter alone.

(1) An example in which it was not possible to change only one parameter in the primary reference (inventive step affirmed) is IP High Court, 2022 (Gyo-Ke) No. 10029, [Antiglare Film] <Presiding Judge Shoji>.

(2) An example in which it was possible to change only one parameter in the primary reference (inventive step denied) is Tokyo District Court, 2015 (Wa) No. 1025, [Low-Extract Beer-Taste Beverage with Adjusted pH] <Presiding Judge Hasegawa>.

End

2021 (Gyo-Ke) No. 10096 <Honda>	Light Source *Numerical limitation for which there are no example data ⇒ No technical	…(Difference) With respect to the “light conversion layer,” the invention in this case “contains a scattering agent,” and “the scattering agent is contained in an amount of 10% by weight or less relative to the total weight of the light conversion layer,” whereas in the cited invention it is unclear whether there is a “scattering agent.” …	Loss / No ★

	significance ⇒ Matter of design choice	…Regarding the configuration in which "a scattering agent is contained in an amount of 10% by weight or less relative to the total weight of the light conversion layer" …The specification of the application contains only statements such as "may be contained in an amount of 10% by weight or less"…, "it is preferable that it be contained in an amount of 10% by weight or less, and more preferable that it be contained in an amount of 1% by weight or more and 5% by weight or less"…, and "preferably 10% by weight or less." … Moreover, … the maximum content percentage described in the examples is only 6% by weight…, and the specification contains no description whatsoever of experimental results where that content percentage exceeds 10% by weight…. In view of the foregoing, it must be said that there is no particular critical significance in setting the scattering-agent content at 10% by weight or less relative to the total weight of the light conversion layer. In addition, … the color coordinates of white light can be adjusted by adjusting the content ratio of the scattering agent, red quantum-dot material, and green quantum-dot material in the light conversion layer. Paragraph [0137] of the specification also indicates that the luminance and other properties of white light can be adjusted by adjusting the scattering-agent content. Taking into account as well the statement in paragraph [0116] of Well-Known Document 1 that "[i]n one preferred embodiment, the concentration range of the scatterer is 0.1 to 10% by weight," a person skilled in the art could appropriately design the scattering-agent content relative to the total weight of the light conversion layer according to the desired characteristics of the white light obtained through that layer.	
2021 (Gyo-Ke) No. 10135 <Kanno>	Vectors Containing Stuffer/Filler Polynucleotide Sequences *Numerical limitation with insufficient example data ⇒ Identical technical significance ⇒ The numerical limitation is not a substantive difference!! ⇒ No novelty	[Claim 1] …a recombinant vector plasmid in which said first inactive filler or stuffer polynucleotide sequence has a length of 7.0 to 10.0 Kb. There is no technical significance in the filler or stuffer polynucleotide sequence of the vector plasmid having a length within the particular range of "7.0 to 10.0 Kb." … In the cited invention as well, the stuffer sequence is modified so that the backbone exceeds the packaging capacity of AAV. The combined length of the transgene (4297 nt (approximately 4.297 Kb)) and the length of the stuffer sequence contained in this backbone (the backbone being 6980 bp (approximately 6.980 Kb)) can be understood to exceed at least the packaging capacity of 4.7 Kb. Thus the claimed invention… and the cited invention are identical in their technical significance, and making the filler or stuffer polynucleotide sequence of the vector plasmid a length within the particular range of "7.0 to 10.0 Kb" in the claimed invention… cannot be regarded as a substantive difference. … It cannot immediately be found that the amount of residual DNA contained in the AAV particles of the claimed invention… is even less than 2.69 ± 0.69 pg/10^9 vg; nor, even if the amount of residual DNA is reduced, can it immediately be found that the reduction results from increasing the length of the oversized backbone….	Loss / No ★
2015 (Gyo-Ke) No. 10206 <Takabe>	Base Fabric for Airbags *There was motivation to move the numerical value	Difference 1B: Dynamic air permeability. In Invention 1 in this case it is "1300 mm/s or less," whereas in the cited invention it is "1498 mm/s." Difference 1C: Pullout resistance of the constituent yarns. In Invention 3 in this case it is "146–200 N/cm/cm," whereas in	Win / Yes ★★★

	of the publicly worked product toward the value of the invention in this case. ⇒ However, because it was unclear how far the value needed to be changed to solve the invention's problem, the value in the invention was not obvious.	Cited Invention 1 it is “53 N/cm/cm.” <JPO trial decision (conclusion: inventive step affirmed; upheld)> Even if the problem is well known, the Exhibit Ko 1 Invention is an “existing product” that has been optimized for its function, so a corresponding motivation is considered necessary to make a change. In the Exhibit Ko 1 Invention, there is no motivation to change the boiling-water shrinkage rate, single-filament fineness of the constituent yarns, pullout resistance of the constituent yarns, and cover factor, which affect dynamic air permeability, within the ranges specified in Invention 1 in this case to the point of bringing dynamic air permeability into the specific range of “1300 mm/s or less.” Nor is there evidence showing that this is possible. <This judgment> (b) Increasing the cover factor …It can be said that, at the priority date in this case, a person skilled in the art would have tried increasing the cover factor of Cited Invention 1 above 2131 to reduce yarn slippage at the seam boundary when the airbag inflates and deploys, and to reduce post-loading dynamic air permeability. However, on the evidence in this case, the relationship between the degree of increase in the cover factor and the degree of decrease in post-loading dynamic air permeability is unclear. Nor is there any indication that common general technical knowledge on this point existed at the priority date. Therefore, it is unclear how much the cover factor of 2131 in Cited Invention 1 should be increased to reduce its post-loading dynamic air permeability from 1498 mm/s… to 1300 mm/s or less. It is conceivable that it would be necessary to increase it beyond the upper limit of 2100–2500, the numerical range of the cover factor stated in Invention 1 in this case to be more preferable “from the perspective of achieving both deployment performance and productivity.” … Moreover, because the cover factor is calculated from the warp/weft average total fineness and the warp/weft average weave density of the constituent yarns…, a change in cover factor can also be said to affect the total fineness of the constituent yarns. … (c) Increasing the pullout resistance of the constituent yarns …It can be said that, at the priority date in this case, a person skilled in the art had motivation to increase the pullout resistance of the constituent yarns in Cited Invention 1 to reduce yarn slippage at the seam boundary when the airbag inflates and deploys and to reduce post-loading dynamic air permeability. However, on the evidence in this case, it is unclear how much the warp/weft average pullout resistance of the constituent yarns in Cited Invention 1, 53 N/cm/cm, would have to be increased to reduce its post-loading dynamic air permeability from 1498 mm/s… to 1300 mm/s or less. It is also unclear whether increasing it to 200 N/cm/cm, the upper limit of that average value in Invention 1 in this case, at which “local stress concentration in the constituent yarns no longer occurs and airbag rupture is not caused,”… would suffice. It is conceivable that an increase beyond that upper limit would be necessary.	

2010 (Gyo-Ke) No. 10296 <Takizawa>	Petrolatum-Based Nasal Ointment *Because the technical significance of the numerical limitation is not described in the specification, inventive step is denied even without a direct suggestion.	[Claim 1] A nasal ointment for the prevention of inhalation-allergic reactions… characterized by having a viscosity of 8 mm²/s (100°C) or more according to DIN 51 562. The cited reference… admittedly contains no direct suggestion to focus on the viscosity of the mixture of saturated hydrocarbons in relation to preventing inhalation-allergic reactions. However, the specification of the application itself contains no description establishing that the numerical value of 8 mm²/s has special technical significance for the viscosity of the saturated-hydrocarbon mixture. Nor does it describe the technical significance of focusing on viscosity among the various physical properties of petrolatum (density, solidification point, viscosity, cone penetration (a kind of viscosity…), average carbon number, and distribution of hydrocarbon carbon numbers). It therefore cannot be said that the specification discloses the technical significance of the viscosity or its numerical value of 8 mm²/s. … The claimed invention does not go beyond the prior art in which viscosity was not defined by a numerical range, and it cannot be said that the claimed invention has remarkable operation and effects by adjusting the viscosity of the mixture of saturated hydrocarbons. Thus, given that the specification describes neither the technical significance of focusing on viscosity nor the technical significance of specifying a viscosity of 8 mm²/s or more, even if the cited reference does not directly suggest preventing allergic reactions by adjusting the viscosity of the mixture of saturated hydrocarbons, inventive step cannot be recognized on the basis of the matters defining the claimed invention.	Loss No △
2022 (Gyo-Ke) No. 10111 <Honda>	Beltline Molding for a Vehicle Door *No description of technical significance in the specification. No effect on operation and effects ⇒ Matter of design choice	The specification in this case contains no description of the technical significance of the stepped portion extending “substantially horizontally” inward from the lower part of the vertical flange. … Whether the stepped portion extends “substantially horizontally” or “slightly downward” has no influence on the operation and effects of the invention. It therefore cannot be found that there is any technical significance in having the stepped portion extend “substantially horizontally.” Nor, in Exhibit Ko 1 Invention 1, can any technical significance be found in the stepped portion extending “slightly downward” from the lower part of the vertical flange toward the vertically movable window glass (inward). Configuring the stepped portion that extends “slightly downward” in Exhibit Ko 1 Invention 1 to extend “substantially horizontally” should be regarded as nothing more than a matter of design choice that a person skilled in the art could make as appropriate.	Loss / No ○
2020 (Gyo-Ke) No. 10044 <Otaka>	Lipid-Containing Composition *Although the numerical value itself was stated in the publication, there was no suggestion to limit it to that value or less. ⇒ No motivation *It was possible to	[Claim 19] …a lipid-containing formulation in which the dose of ω-6 fatty acids is 40 g or less. The defendant argues as follows: ① Publication 5 states that fat intake has increased to 40 g per day and indicates recognition of this as a problem. The Publication 5 Invention is based on the technical concept of taking ω-6 and ω-3 fatty acids in a balanced manner on the premise of curbing excessive lipid (fat) intake. Therefore, it is only natural to keep ω-6 fatty acids, which are a subset of unsaturated fatty acids that in turn form part of lipids, below a certain level, and there is strong motivation to specify a value of 40 g or less, 40 g being recognized as excessive intake of lipids as a whole. ② Moreover, daily lipid intake also comes from foods other than the drink composition of the Publication 5	Win Yes ★★★

	focus on the parameter and numerical value, but… motivation to make it “that value or less” was denied.	Invention, so setting an upper limit of 40 g of ω-6 fatty acids per day or per serving is a technical matter that a person skilled in the art could readily accomplish. Accordingly, a person skilled in the art could easily have arrived at the configuration of the claimed invention relating to Difference 2 in the Publication 5 Invention. However, … Publication 5 states: “The Japanese diet has recently become increasingly Westernized, with a substantial increase in opportunities to eat meat-centered meals. Fat intake has increased to 40 g per day. The types of diseases have changed accordingly, with increases in cardiovascular diseases such as hypertension and heart disease, and in breast cancer and colorectal cancer, thus also becoming Westernized and constituting a major social problem.” This is immediately followed by statements including: “However, as research progressed, it became apparent that this was caused by an imbalance in the intake of the types of unsaturated fatty acids constituting fats.” In light of this, the natural understanding is that the passage neither states that the increase in “fat intake” to “40 g per day” is itself a problem nor suggests that this should be improved. …	
2019 (Gyo-Ke) No. 10010 (Related case: No. 10011, discussed separately above) <Takabe>	Engineering of Systems, Methods, and Optimized Guide Compositions for Sequence Manipulation *Identification of the invention in an earlier application (The same exercise as for inventive step) ⇒ 2013 (Gyo-Ke) No. 10199 and 1999 (Gyo-Ke) No. 285 apply the same standard. *The patent applicant pointed out inconsistencies in the experimental data in the earlier application's specification and argued that the system of the earlier invention could not solve the problem of the claimed invention, but this argument was not accepted.	…Even in the absence of a specific description in the specification and other documents of the earlier application, the earlier invention may be identified by taking into account the common general technical knowledge of a person skilled in the art when understanding that invention. On the other hand, an invention that is abstract, or whose technical content is still insufficiently disclosed even after considering that knowledge, does not constitute an “invention” for this purpose and does not have the effect of excluding a later application under that Article. The degree of disclosure of technical content required here should be regarded as sufficient if the description enables a person skilled in the art to understand that the earlier invention is presented there and that it can be carried out. … Examples 1–3 of Cited Invention 1 describe in detail the methods of producing each of the vectors (i)–(iii) of Cited Invention 1. Example 4 also expressly describes a specific test method for confirming that the donor sequence (GFP gene) has been incorporated into or near the target sequence. Furthermore, … the experimental results in Example 4 can be understood to show that the combination of an RNA-guided endonuclease containing a nuclear localization signal, guide RNA, and a donor polynucleotide is incorporated into a eukaryotic cell and that double-strand cleavage and repair occur at the target site. The experimental results in Example 5 are not understood to impede that understanding. In addition, the vector system containing the vectors (i)–(iii) above has the technical means necessary for appropriate transcription, translation, nuclear translocation, and so forth in a eukaryotic cell, as well as the technical means necessary for appropriate modification of the target sequence in such a cell. Therefore, as already explained, it can be understood that even when constituted as a vector system, it has the function of cleaving and modifying the target sequence in a eukaryotic cell. Accordingly, Cited Reference 1 contains a description sufficient for a person skilled in the art to understand that the earlier invention is presented there and can be carried out. … It is therefore appropriate to find that technology had been disclosed to an	Loss / No △

		extent sufficient to exclude a later application.	
2022 (Gyo-Ke) No. 10029 <Shoji>	Antiglare Film *Where two parameters are interrelated, the court denied that there was a suggestion to adjust only one parameter of the primary cited invention independently of the other parameter.	[Claim 1] An antiglare film… having a haze value in a range of 60% or more and 95% or less, and an internal haze value in a range of 0.5% or more and 8.0% or less. Difference 1-1 / The "antiglare layer" of Invention 1 in this case has "an internal haze value in a range of 0.5% or more and 8.0% or less," whereas the "internal haze value" of the cited invention is unknown. … Cited Reference 2… describes expressing the degree of unevenness (the surface-diffusion element) more specifically by defining surface haze…. Since the surface haze value defines the shape of the unevenness, which is technically inseparable from sparkle, the description in Cited Reference 2 cannot be understood as suggesting adjustment of sparkle independently of the surface haze value. … Although Well-Known Document A1 also states that "the internal haze is preferably 5–30%," it also states that "the surface haze is preferably 20–50%." … It therefore does not suggest adjusting sparkle independently of the surface haze value.	Win Yes ★
2015 (Wa) No. 1025 <Hasegawa>	Low-Extract Beer-Taste Beverage with Adjusted pH *If the parameters are unrelated, it is permissible to extract and identify only the specific parameter constituting the difference from the publicly worked invention!! *The problem of the publicly worked product was identified from consumer evaluations. ⇒ Inventive step denied Cf. 2012 (Gyo-Ke) No. 10275	The plaintiff argues that the technical concept of the invention in this case lies in discovering a relationship between the respective numerical ranges of total extract, pH, and carbohydrate content and the effects of providing a satisfying drinking sensation and appropriate acidity. Because Publicly Worked Invention 1 does not disclose such a technical concept, the plaintiff argues that it is impermissible to identify Publicly Worked Invention 1 by extracting only total extract, pH, and carbohydrate content from the numerous analysis items for All-Free, and that differences should be identified by treating total extract, pH, and carbohydrate content as a single integrated configuration. … Although the claims of the invention in this case limit the numerical ranges of total extract, pH, and carbohydrate content, it is sufficient that each respective value fall within its range; no particular correlation among them is specified. Moreover, the detailed description of the invention in the specification contains no statements such as what pH range is desirable when total extract is 0.5% by weight and what pH range is desirable when it is 2.0% by weight. In short, it is sufficient that total extract, pH, and carbohydrate content each fall within their respective numerical ranges. … Among the numerous analysis items for Publicly Worked Invention 1 shown in Appendices 1-1 to 1-3, the analysis results for components and the like other than total extract, pH, and carbohydrates need not be considered when examining inventive step of the invention in this case. … When identifying differences from Publicly Worked Invention 1 as a premise for assessing inventive step, it is sufficient to examine the respective numerical values of total extract, pH, and carbohydrates. …	Loss No ★

<IP LAB ③> Limits on Abstracting a “Secondary” Cited Invention (Inventive Step)

Original Ameblo publication: 2024-01-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12836020890.html

<IP LAB ③>

Limits on Abstracting a “Secondary” Cited Invention (Inventive Step)

Taking as our starting point the IP High Court's judgment in 2022 (Gyo-Ke) No. 10009, [Gas Fire-Extinguishing Equipment] <Presiding Judge Otaka>, which overturned an opposition decision that had excessively abstracted (generalized) a secondary reference by disregarding the structure on which it was premised, this article considers the “limits on abstracting a ‘secondary’ cited invention” in inventive-step assessments and introduces relevant court decisions.

The Pyrimidine Grand Panel judgment (IP High Court, Grand Panel, 2016 (Gyo-Ke) No. 10182) held: “Where an invention asserted as a cited invention is an ‘invention described in a publication,’ and a compound is described in that publication in the form of a general formula having an enormous number of alternatives, it is appropriate to find that, unless there are circumstances warranting affirmative or preferential selection of the technical idea relating to a particular alternative, a specific technical idea relating to that particular alternative cannot be extracted and cannot be identified as a cited invention. The same reasoning applies when identifying a secondary cited invention from a publication where there is another ‘invention described in a publication’ under paragraph (1), item (iii) of that Article corresponding to the differences between the claimed invention and the primary cited invention (hereinafter a ‘secondary cited invention’), and it is being assessed whether the claimed invention could easily have been made by applying the secondary cited invention to the primary cited invention. Therefore, where the secondary cited invention is an ‘invention described in a publication,’ and a compound is described in that publication in the form of a general formula having an enormous number of alternatives, it is appropriate to find that, unless there are circumstances warranting affirmative or preferential selection of the specific technical idea relating to a particular alternative, that specific technical idea cannot be extracted and cannot be identified as a secondary cited invention.” Thus it described what is combined with the primary reference in an inventive-step assessment as “another ‘invention described in a publication’ under paragraph (1), item (iii) of that Article corresponding to the differences between the claimed invention and the primary cited invention (hereinafter a ‘secondary cited invention’).”

The IP High Court judgment in 2022 (Gyo-Ke) No. 10009, [Gas Fire-Extinguishing Equipment] <Presiding Judge Otaka>, refers to the secondary reference as the “Exhibit Ko 2 technical matters” (as many judgments do). However, it is understood to have held that cherry-picking part of a “coherent technical idea” from a secondary reference (generalizing it) is erroneous. Thus, whether the secondary reference is called the “Exhibit Ko 2 technical matters” or the “Exhibit Ko 2 Invention,” the judgment is consistent with the Pyrimidine Grand Panel judgment. Indeed, many decisions have held that not only a primary reference but also a secondary reference must constitute a “coherent technical idea” (the group of decisions marked ★ below); conversely, there are no decisions expressly stating that a secondary reference need not be a “coherent technical idea.”

Accordingly, a petitioner for a patent invalidation trial should be careful about abstracting or generalizing what is disclosed in primary and secondary references. Conversely, it is preferable for a publicly known document not to contain specific descriptions unnecessary for comparison with the invention in question. Where a publicly known document contains multiple descriptions at different levels of abstraction, it is desirable to present technical matters at an appropriate level of abstraction that do not include specific

technical matters that would constitute differences in a comparison with the invention. In that sense, one should always consider whether to use an example in the publicly known document or a general description in it as the cited reference, and at which level of abstraction the disclosure should be cited. (For example, as discussed below, IP High Court, 2022 (Ne) No. 10008 and 2021 (Gyo-Ke) No. 10027, [Information Providing Device] <Presiding Judge Otaka>, illustrate a case in which the outcome of the novelty and inventive-step assessments differed depending on which level of abstraction of the disclosure in the publicly known document was used as the reference.)

In connection with this issue, the following two decisions are important examples in which the court overturned the assessment of the level of abstraction of the invention identified from a cited document and set aside the JPO decision (details follow below).

IP High Court, 2016 (Gyo-Ke) No. 10061 <Presiding Judge Tsuruoka>, held that the cited invention was not limited to the examples described in the cited document and revoked the JPO decision that had affirmed inventive step on the basis of an erroneous identification of the differences.

IP High Court, 2017 (Gyo-Ke) No. 10062 <Presiding Judge Takabe>, affirmed inventive step on the ground that the cited invention was defined by a configuration different from that of the invention in question.

In IP High Court, 2022 (Gyo-Ke) No. 10009, [Gas Fire-Extinguishing Equipment] <Presiding Judge Otaka>, too, the finding that the Exhibit Ko 2 technical matters were “premised on the use of a rupture disk” was decisive, and the reasoning for the case in which a rupture disk was not used was rejected. The level of abstraction of the cited reference is an important issue in novelty and inventive-step assessments.

The author also addresses this important issue of limits on abstracting a cited invention in the following video, “All Issues Concerning Inventive Step.”

https://www.youtube.com/watch?v=HEU-zc-jOXI&t=636s

[Introduction to Related Decisions (Limits on Abstracting a “Secondary” Cited Invention)]

(1) Decisions holding that a secondary reference, too, must be a “coherent technical idea” (★)

IP High Court, 2020 (Gyo-Ke) No. 10066, [Biaxial Hinge] <Presiding Judge Mori> — No motivation to extract only part of the secondary cited invention and apply it to the primary cited invention.

(Excerpt from the court's reasoning)

…They are functionally interlinked and integrally configured…. There is no motivation to extract only supporting piece 511 and supporting piece 512 from the integrally configured members described above and apply the configuration of having a pair of supporting pieces to the Exhibit Ko 2 Invention…. …The Exhibit Ko 2 Invention includes a member corresponding to the stopper mechanism of the Exhibit Ko 1 Invention… and has selective rotation-restriction means…. The integrally configured members of the Exhibit Ko 1 Invention described above include a stopper mechanism and selective rotation-restriction means, so there is also no motivation to apply those integrally configured members of the Exhibit Ko 1 Invention to the Exhibit Ko 2 Invention….

IP High Court, 2019 (Gyo-Ke) No. 10041, [Wound Dressing] <Presiding Judge Kanno> — No motivation to extract only part of the secondary cited invention and apply it to the primary cited invention.

(Excerpt from the court's reasoning)

…The invention described in Exhibit Ko 4 has a structure integrating a first layer with numerous holes that form an appropriate retention space between the wound surface and the second layer, retain an appropriate amount of exudate on the wound surface, and prevent the exudate from spreading in the in-plane direction; a second layer that is a sheet material with initial water-pressure resistance; and a sheet material capable of absorbing and retaining water (a third layer). Because its technical significance lies in maintaining a moist wound surface through this structure, there is no motivation to extract only the first layer of the invention

described in Exhibit Ko 4 and apply it to the Exhibit Ko 1 Invention. …The three functions of Common General Technical Knowledge 1 asserted by the plaintiff are merely described in the three patent documents above concerning wound dressings having those functions. Disregarding the specific configurations of the wound dressings, those individual descriptions in the patent documents are insufficient to establish that, for wound dressings generally, it was common general technical knowledge to provide the functions of Common General Technical Knowledge 1 in order to perform moist wound healing effectively.

IP High Court, 2013 (Ne) No. 10025 <Presiding Judge Shimizu> — Excessive generalization of the secondary cited invention was rejected. ⇒ The first-instance judgment, Osaka District Court, 2011 (Wa) No. 11104, had denied inventive step based on the same primary and secondary references.

(Excerpt from the court's reasoning)

Exhibit Otsu 7 does not disclose a configuration in which “side walls” and “inner contact pieces” are connected in that order along the four sides of a “box bottom,” and the “side walls” nearer the four sides are “notched by a length equal to the width of the support posts.” It cannot be said to have been easy for a person skilled in the art to extract, from the Exhibit Ko 2 Invention in which part of an outer side plate farther from the box bottom is notched, a generalized technical idea of notching only part of a side plate, whether inner or outer, and apply it to the inner side plate folded inward in the Exhibit Otsu 13 Invention. The view that this would have been obvious must be regarded as precisely “hindsight” based on knowledge of the configuration of the invention in this case.

IP High Court (Grand Panel), 2016 (Gyo-Ke) No. 10182, [Pyrimidine Derivatives] — A secondary reference, too, must be an “invention” (= a specific technical idea).

(Excerpt from the court's reasoning)

…In assessing inventive step, an invention under any of the items of paragraph (1) of that Article to be compared with the claimed invention (hereinafter the “primary cited invention,” and collectively with the “secondary cited invention” discussed below, the “cited inventions”) is ordinarily selected from those in a technical field related to the claimed invention and within the scope of what a person skilled in that field would consider. An “invention described in a publication” under paragraph (1), item (iii) of that Article must form the basis for determining whether a person skilled in the art could easily have made the claimed invention on the basis of the state of the art at the time of filing, and must therefore be a specific technical idea that can be extracted from the description in that publication. Where a compound is described in the publication in the form of a general formula having an enormous number of alternatives, a person skilled in the art cannot extract from that description the specific technical idea relating to a particular alternative unless there are circumstances warranting affirmative or preferential selection of that specific technical idea. Accordingly, where the invention asserted as a cited invention is an “invention described in a publication,” and a compound is described in the publication in the form of a general formula having an enormous number of alternatives, the specific technical idea relating to a particular alternative cannot be extracted and cannot be identified as a cited invention unless there are circumstances warranting affirmative or preferential selection of the technical idea relating to that alternative….

The same reasoning applies when identifying a secondary cited invention from a publication where there is another “invention described in a publication” under paragraph (1), item (iii) of that Article corresponding to the differences between the claimed invention and the primary cited invention (hereinafter the “secondary cited invention”), and it is being assessed whether the claimed invention could easily have been made by applying the secondary cited invention to the primary cited invention. Thus, where the secondary cited invention is an “invention described in a publication,” and a compound is described in that publication in the form of a general formula having an enormous number of alternatives, the specific technical idea relating to a particular alternative cannot be extracted and cannot be identified as a secondary cited invention unless there are circumstances warranting affirmative or preferential selection of that specific technical idea…. …

Exhibit Ko 2… describes "−NR4R5" as an alternative for substituent R3 at the 2-position of the pyrimidine ring in the "particularly preferred compounds" among compounds represented by general formula (I), and describes a "methyl group" and an "alkylsulfonyl group" as alternatives for R4 and R5. However, there are an extremely large number of alternatives for R3 in the "particularly preferred compounds" described in Exhibit Ko 2, numbering at least more than 20 million…. Choosing "−NR4R5" as R3, with R4 and R5 being "methyl" and "alkylsulfonyl," is one of more than 20 million alternatives. Moreover, Exhibit Ko 2 describes not only "particularly preferred compounds" but also "particularly especially preferred compounds," and "−NR4R5" is not listed as an alternative for R3 in the latter. Furthermore, Exhibit Ko 2… describes Example 8 (R3 is methyl), Example 15 (R3 is phenyl), and Example 23 (R3 is phenyl) as examples of compounds in which X and A in general formula (I) have the same structures as in the Exhibit Ko 1 Invention, but does not describe any example selecting "−NR4R5" as R3. Accordingly, even if an alkylsulfonyl group is described in Exhibit Ko 2, a person skilled in the art cannot find in that description circumstances warranting affirmative or preferential selection of "−NR4R5" as R3 in… general formula (I). Having selected "−NR4R5," it is also difficult to find circumstances warranting the further selection of "methyl" and "alkylsulfonyl" as R4 and R5.

Therefore, Exhibit Ko 2 cannot be evaluated as permitting extraction of a technical idea of making the group at the 2-position of the pyrimidine ring "−N(CH3)(SO2R′)." It cannot be said that Exhibit Ko 2 describes the configuration relating to Difference (1-i), and the configuration of the invention in this case relating to Difference (1-i) cannot be obtained by combining the Exhibit Ko 2 Invention with the Exhibit Ko 1 Invention. …

(2) Decisions setting aside a JPO decision by overturning the level of abstraction of the cited invention identified from the cited document

IP High Court, 2016 (Gyo-Ke) No. 10061 <Presiding Judge Tsuruoka>, held that the cited invention was not limited to the examples described in the cited document and revoked the JPO decision that had affirmed inventive step on the basis of an erroneous identification of the differences.

(Excerpt from the court's reasoning)

…Publication 1 shows, as an example, a configuration in which multiple fixed wireless units are provided in respective predetermined rooms of a facility…. However, no particular technical relationship can be found between limiting the installation locations of the multiple fixed wireless units to "each room of a facility" and the means of solving the problem. It is also found that the problem of the Publication 1 Invention can be solved and its operation and effects achieved without such a limitation. It is therefore inappropriate to limit that invention to the technical content of the example described above. (The example merely illustrates one embodiment of the invention; this does not mean that implementation in other forms cannot be read from Publication 1.) Accordingly, it is also inappropriate to limit Cited Invention A… to that technical content, and comparison with Corrected Invention 1 in this case should be made against Cited Invention A identified as including, but not being limited to, "each room of a facility" as the installation locations of the multiple fixed wireless units. …

If Difference 1′ is identified as above, and assuming that the configuration relating to that difference (a configuration in which multiple activation-signal transmitters are installed on one side and the other side of an entrance/exit to detect the position of a moving object) was well known when the patent application was filed, Cited Invention A and that well-known technology would be found to belong to related technical fields and share a common problem in that both aim to detect the position of a moving object. Moreover, because Cited Invention A does not specify (limit) the installation locations of the multiple fixed wireless units, there would be no particular circumstances constituting a factor inhibiting application of the well-known technology….

IP High Court, 2017 (Gyo-Ke) No. 10062 <Presiding Judge Takabe>, affirmed inventive step on the ground that the cited invention was defined by a configuration different from that of the invention in question.

(Excerpt from the court's reasoning)

…The cited reference is found to describe an invention (…) consisting of "…". Thus the finding in the decision in this case that one electrode of the SiC MOSFET and one electrode of the SiC Schottky diode were both unknown must be regarded as erroneous. …

Furthermore, the cited reference contains no description or suggestion that, when the combination of IGBT 4 and diode 5 is replaced by a combination of a SiC MOSFET and a Schottky barrier diode, operation should differ before and after replacement.

Moreover, Cited Invention A… is an invention addressing the problem of… and aiming to… (…). Achieving that objective is unrelated to changing the type of SiC MOSFET or the connection direction of the Schottky barrier diode connected in parallel. Therefore, it cannot be said that a person skilled in the art would be motivated, in Cited Invention A, to change "one electrode of said PN-junction diode" and "one electrode of said Schottky barrier diode" from cathode electrodes to anode electrodes in order to achieve that objective. Accordingly, it cannot be found that a person skilled in the art could easily have arrived at the configuration of Invention 1 in this case relating to Difference 1′.

(3) Introduction to 2022 (Ne) No. 10008 and 2021 (Gyo-Ke) No. 10027, [Information Providing Device] <Presiding Judge Otaka>

A case in which patentability assessments differed in IP High Court judgments handed down on the same day by the same division (an infringement appeal and an action to revoke a JPO decision), involving the same patent and the same cited document. ⇒ The logic of an invalidity defense can be changed flexibly!!

The infringement appeal (2022 (Ne) No. 10008) and the action to revoke the JPO decision (2021 (Gyo-Ke) No. 10027) share the following points.

The "information providing device" of the invention in this case means a single device.

The "learning/life support system 1" in the cited document consists of multiple elements (devices): ① a learning/life support server 2 connected via network N, and ② user terminals 3 used by multiple course participants and students.

<Analytical framework and conclusion of the judgment in the action to revoke the JPO decision (2021 (Gyo-Ke) No. 10027)> — Claim dismissed

(On the premise of the comparison made at the JPO trial stage) the "learning/life support system 1" in the cited document consists of multiple devices and therefore does not correspond to the "information providing device" of the invention in this case. The difference is not obvious. ⇒ Inventive step affirmed

<Analytical framework and conclusion of the infringement appeal judgment (2022 (Ne) No. 10008)> — Appeal dismissed

Only "server 2" within the "learning/life support system 1" in the cited document was compared as corresponding to the "information providing device" of the invention in this case. Both are single devices, and under this comparison this becomes a common feature. ⇒ No novelty

<IP LAB ④> “One-Line Descriptions and Identification of Cited Inventions” (Novelty and Inventive Step)

Original Ameblo publication: 2024-01-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12836020972.html

<IP LAB ④>

“One-Line Descriptions and Identification of Cited Inventions” (Novelty and Inventive Step)

A primary reference described in a publicly known document and used to deny novelty or inventive step must be an “invention” (Patent Act, Article 29(1)(iii)). (According to the Pyrimidine Grand Panel judgment (IP High Court, 2016 (Gyo-Ke) Nos. 10182 and 10184), a secondary reference must also be an “invention,” but even among JPO decisions and judgments following that Grand Panel judgment, many refer to a secondary reference as “matters” rather than an “invention.”)

Accordingly, at least a primary reference based on documentary prior art must be an “invention.” Even if it need not satisfy the enablement requirement of Article 36(4) of the Patent Act, a person skilled in the art must be able to understand it as an “invention” under Article 29(1), and a so-called one-line description is not recognized as a cited invention. (One could presumably obtain a patent even if an “Anywhere Door” were described in a cited document. There is a decision holding that, even if a cited invention has not been completed as an invention, it is eligible as a cited invention if a person skilled in the art can understand it as an invention (Tokyo High Court, 2000 (Gyo-Ke) No. 315).)

This article considers Tokyo District Court, 2022 (Wa) No. 9716, [5-Aminolevulinic Acid Phosphate], and introduces decisions on the issue of “one-line descriptions and identification of cited inventions” in novelty and inventive-step assessments. In that case, the particular phosphate became capable of being manufactured as a result of the patent application, and the claim limitations were therefore satisfied. However, before the filing date, a person skilled in the art could not manufacture it without thought or trial and error. Thus, although the name of that particular phosphate appeared in a publicly known document, it was not recognized as a cited invention, and novelty and inventive step were affirmed (the patentee prevailed).

(Note) The judgment found the claim limitations satisfied on the ground that each of the defendant's products contains the 5-aminolevulinic acid phosphate of the invention itself, and held that the compound achieves the effects of the invention even if it is not isolated and even if its concentration in the product is not high (judgment, pp. 12–13). The judgment does not treat the compound's having become producible through the disclosure in the patent specification as a reason for satisfaction of the claim limitations.

The author has also released the following three videos on the important issue of identifying cited inventions, which are introduced here.

① All Issues Concerning Inventive Step

https://www.youtube.com/watch?v=HEU-zc-jOXI&t=636s

② <Identification of Cited Inventions> Can a cited invention be read from drawings in a patent publication? (Shape, relative size, positional relationships, dimensions, arrangement, direction, existence)

③ Statements in a specification that “various modifications are possible without departing from the spirit of the invention” and inventive-step assessments

https://www.youtube.com/watch?v=m9qsrCbhOI4&t=183s

Tokyo District Court, 2022 (Wa) No. 9716, [5-Aminolevulinic Acid Phosphate] <Presiding Judge Shibata> *Inventive step affirmed (claim limitations also satisfied; patentee wins)

“…It cannot be said that Documents Otsu 16 through Otsu 18 disclose a technique for obtaining 5-aminolevulinic acid itself. In addition, … the cited reference in this case also states that ‘5-ALA is… an extremely chemically unstable substance’ and ‘only an acidic aqueous solution of 5-ALA HCl is shown to be sufficiently stable’ ([0007]). Taking into account that these matters were common general technical knowledge at the priority date in this case, it cannot be found that a technique for obtaining 5-aminolevulinic acid itself was well known at that time.

On this point, the plaintiff argues that, in manufacturing 5-aminolevulinic acid phosphate, 5-ALA need not have been isolated as a substance and may be present mixed with medium components and the like in a fermentation broth. However, at the priority date in this case, a method of adding an acid or base to a mixed solution containing various components cannot be found to have been common general technical knowledge as a method of manufacturing a salt as a compound. Therefore, it cannot be said that a person skilled in the art encountering the cited reference at that time could, without exercising creative abilities such as thought or trial and error, have discovered, as a method of manufacturing the compound 5-aminolevulinic acid phosphate, a method of adding phosphoric acid to a fermentation broth in which 5-aminolevulinic acid was present mixed with medium components and the like (or adding that fermentation broth to a phosphoric acid solution). Moreover, … as is clear from the statement in Document Otsu 17 that the medium contains yeast extract, tryptone, and the like, a fermentation broth mixed with medium components and the like contains various ions as impurities. Even if phosphoric acid is added to such a fermentation broth, this cannot be evaluated as manufacture of the compound 5-aminolevulinic acid phosphate by a neutralization reaction between equimolar quantities of acid and base…. …There are no other circumstances indicating that a person skilled in the art at the priority date could have discovered a method of manufacturing or otherwise obtaining 5-ALA phosphate. …

In light of the foregoing, it cannot be said that a person skilled in the art encountering the cited reference at the priority date could, on the basis of common general technical knowledge at that date, have discovered a method of manufacturing or otherwise obtaining 5-ALA phosphate without exercising creative abilities such as thought or trial and error. Accordingly, 5-ALA phosphate cannot be identified as a cited invention from the cited reference in this case.”

(*“5-ALA phosphate” = “5-aminolevulinic acid phosphate”)

At the beginning of its novelty assessment, this judgment states that “[i]t cannot be found that a technique for obtaining 5-aminolevulinic acid itself was well known at the priority date in this case,” which might prompt a hasty assumption that it conflicts with the finding that the claim limitations are satisfied. However, reading further into the novelty reasoning, the judgment states that “this cannot be evaluated as manufacture of the compound 5-aminolevulinic acid phosphate.” It recognized novelty and inventive step

because, at the priority date, a person skilled in the art could not manufacture the novel compound of the invention without trial and error.

In this case, the substance's name (5-aminolevulinic acid phosphate, the invention in question) was described in the cited document. Nevertheless, the disclosure in that document was not recognized, or its eligibility as a cited invention was denied, because a person skilled in the art at the priority date could not carry it out without trial and error.

Not only this judgment but many decisions hold that, for disclosure of a cited invention to be recognized in a cited document, a person skilled in the art must be able to carry out the configuration and other features of the invention without trial and error, based on the disclosure in the cited document and common general technical knowledge. Applied to this case, at a minimum a person skilled in the art would have needed to be able to manufacture ‘5-aminolevulinic acid phosphate’ as part of a mixture without trial and error.

However, under the state of the art at the priority date, it was difficult not only to isolate it, but also to manufacture 5-aminolevulinic acid ‘phosphate’ even as part of a mixture. That is why novelty and inventive step were recognized despite the substance's name appearing in the cited document. One should always bear in mind the possible rebuttal that, as in this case, even if the compound of the invention is mentioned by name in a publicly known document, a person skilled in the art could not manufacture it without trial and error under the state of the art at the priority date.

Thus, there is no contradiction between this judgment's findings on satisfaction of the claim limitations and invalidity. Under the state of the art at the filing date (priority date), a person skilled in the art could not manufacture the compound of the invention without trial and error. However, because the disclosure of the patent specification made it possible for a person skilled in the art at the time of infringement to manufacture the compound without trial and error (otherwise there would be an enablement or support issue), the claim limitations were held to be satisfied.

This situation has something in common with the relationship between the third and fourth requirements of the doctrine of equivalents, in that they use different reference dates. The third requirement asks whether a person skilled in the art could easily have conceived of replacing the claimed configuration with the configuration of the accused product or process at the time of its manufacture or use. The fourth requirement, by contrast, requires that the accused product or process was neither identical to the publicly known technology at the filing date nor easily deducible from it by a person skilled in the art at that date. This can encompass cases where subsequent technological developments make substitution easy, but a change in ease between filing and manufacture is not itself a necessary condition for equivalence.

However, according to the general approach adopted by many decisions, including this one, even if a compound's name appears in a publicly known document, novelty and inventive step are not immediately denied unless it can be proven that, under the state of the art at the filing date (priority date), a person skilled in the art could manufacture the compound without trial and error. The first person to succeed in manufacturing a particular compound as part of a mixture would therefore be granted a patent even without isolating it, and could enforce that right against those who work a mixture containing the compound after filing. In an invention such as this one, 5-aminolevulinic acid was known, the new substance was obtained by making it into a ‘phosphate,’ and the compound ‘5-aminolevulinic acid phosphate’ itself was expressly mentioned in a publicly known document. Where the technical significance of the invention lies in being the first to manufacture the ‘phosphate,’ there is room for debate as to whether granting a patent as a product invention, rather than a manufacturing-process invention, strikes the proper balance, and whether it is appropriate to allow enforcement against an alleged infringer who manufactures or otherwise deals with a mixture containing that compound by a method other than the manufacturing method actually invented by the inventor.

(Note) Article 66(1) of the Patent Act provides that a patent right becomes effective upon registration of its establishment. Accordingly, a patent right can be enforced only after registration.

There are also cases such as IP High Court, 2007 (Gyo-Ke) No. 10378, [Crystalline Azithromycin Dihydrate], discussed below. Although it was argued that an identical product had existed before filing, the court rejected the asserted lack of novelty because a person skilled in the art at the priority date could not identify that product from the cited document and reproducibility of the described manufacturing method was not established. The court did not decide whether the product in the cited document was in fact identical to the invention. Nevertheless, if the substance was not actually new and the inventor was merely the first to notice it, there is room for debate in relation to the public domain: does granting a patent as a product invention strike the proper balance, and is it appropriate to permit enforcement against an alleged infringer who continues to manufacture and sell the prior art (= a product that in fact contained the substance, though nobody had noticed it)?

<Introduction to Related Decisions>

Tokyo High Court, 1996 (Gyo-Ke) No. 136, [Novel Peptide] — Decision of refusal ⇒ JPO decision revoked (*Ineligible as a cited invention)

“Generally, for a compound to be recognized as described in a cited reference, the compound must actually be made available. Merely showing a chemical structural formula or manufacturing method and demonstrating theoretical manufacturability is insufficient; it must be possible to confirm the compound in practice. The cited reference does not disclose a method of manufacturing the motilin derivative (the motilin of the application) that is…, nor does it state a melting point or any other grounds demonstrating that it was actually manufactured.”

IP High Court, 2009 (Gyo-Ke) No. 10180, [Process for Preparing 4-Amino-1-Hydroxybutylidene-1,1-Bisphosphonic Acid or Its Salts and Certain Salts of Said Acid] — Decision of refusal ⇒ JPO decision revoked (*Ineligible as a cited invention)

*Enablement is required for ‘eligibility as a cited invention.’ (2004 (Gyo-Ke) No. 259 and 2012 (Gyo-Ke) No. 10134 take the same approach.)

⇒ A case denying eligibility as a cited invention to a one-line description in a collection of academic conference abstracts.

*The experimental certificate relies on knowledge that was not common general technical knowledge at the priority date.

“The… trihydrate in this case is a novel chemical substance. Although Document Ko 7 states the chemical formula of an organic compound equivalent to this trihydrate, it neither describes nor suggests a manufacturing method. …These points are also acknowledged by the JPO decision.

The first issue in such a case is therefore whether Document Ko 7 constitutes a ‘publication’ under Article 29(1)(iii) of the Patent Act, which is a prerequisite to applying Article 29(2). Article 29(1) provides that a patent may not be granted for an ‘invention described in a publication distributed… prior to the filing of the patent application’ under item (iii). To say that a ‘product invention’ is described in such a ‘publication,’ it goes without saying that the configuration of that product invention must be disclosed in the publication. Furthermore, given that an invention is a creation of a technical idea (see Article 2(1) of the Act), the invention's technical idea must be disclosed to an extent enabling a person skilled in the art who encounters that publication to implement it on the basis of common general technical knowledge at the filing date, without exercising creative abilities such as thought or trial and error. Particularly where the product is a novel chemical substance, it is often difficult to discover a method of manufacturing or otherwise obtaining it. Thus, generally, to say that its technical idea is disclosed in a publication requires not merely disclosure of the substance's configuration but also a description sufficient to understand its manufacturing method. If the publication does not contain a description sufficient to understand the manufacturing method, it is necessary that a person skilled in the art who encounters it be able to discover a method of manufacturing

or otherwise obtaining the substance, based on common general technical knowledge at the filing date, without exercising creative abilities such as thought or trial and error….

In this case, … Document Ko 7 cannot be said to contain a description sufficient to understand the manufacturing method. Accordingly, under the assessment standard… above, for Document Ko 7 to constitute a 'publication' under Article 29(1)(iii) of the Patent Act, a person skilled in the art encountering Document Ko 7 must be able to discover a method of manufacturing or otherwise obtaining the trihydrate in this case, based on common general technical knowledge at the filing date, without exercising creative abilities such as thought or trial and error…. …In this case, such common general technical knowledge cannot be found to have existed at the time of the application…."

IP High Court, 2007 (Gyo-Ke) No. 10120, [Crystalline Azithromycin Dihydrate] <Presiding Judge Tanaka>

*A case denying eligibility as a cited invention to a one-line description.

"…Article 29(1) of the Patent Act provides that a patent may not be granted for an 'invention described in a publication distributed… prior to the filing of the patent application' under item (iii). To say that a 'product invention' is described in such a 'publication,' … the invention's technical idea must be disclosed to an extent enabling a person skilled in the art who encounters the publication to implement that technical idea easily, without special thought. Where the product is, for example, a novel chemical substance, it is generally often difficult to discover a method of manufacturing or otherwise obtaining it. Thus, to say that its technical idea is disclosed in a publication may require a description sufficient to understand its manufacturing method."

IP High Court, 2007 (Gyo-Ke) No. 10378, [Crystalline Azithromycin Dihydrate] <Presiding Judge Tanaka>

*In applying Article 29(1)(iii) of the Patent Act to a novel substance, the issue is whether it could be understood at the priority date that a product identical to the invention was described in the cited document, not whether a product identical to the invention existed before the priority date.

*This case also rejected replication experiments based on the cited document.

*There are many cases in which novelty was assessed through replication experiments.

E.g., 1995 (Gyo-Ke) No. 205, the 'Ethylene Polymer' case (see 'Novelty of Inventions Defined by Physical Properties,' Intellectual Property Management, April 2010 issue).

= 2007 (Gyo-Ke) No. 10120, 'Crystalline Azithromycin Dihydrate' (inventive step over crystalline azithromycin monohydrate)

"[Claim 1] Crystalline azithromycin dihydrate

(1) Article 29(1) of the Patent Act provides that a patent may not be granted for an 'invention described in a publication distributed… prior to the filing of the patent application' under item (iii). To say that a 'product invention' is described in such a 'publication,' first, the configuration of that product invention must be disclosed in the publication. Moreover, given that an invention is a creation of a technical idea (see Article 2(1) of the Act), disclosure of the product invention's configuration alone is insufficient; the invention's technical idea must be disclosed to an extent enabling a person skilled in the art who encounters the 'publication' to implement it easily without special thought. This requirement—that the technical idea be disclosed to an extent enabling a person skilled in the art to implement it easily without special thought—does not differ at all depending on whether the 'product invention' described in the 'publication' is an invention of a novel chemical substance or of a known chemical substance. However, in the case of a known chemical substance, a person skilled in the art can often understand how to obtain it from descriptions in prior-art documents, common general technical knowledge, and the like, even if the 'publication' itself does not describe a manufacturing or other acquisition method. By contrast, for novel

chemical substances it is generally often difficult to discover a manufacturing or other acquisition method. Therefore, it can be said that, in many cases, a description sufficient to understand the manufacturing method is required to say that the technical idea is disclosed in the 'publication.' This is why the required content of the description for a substance to be regarded as described in a 'publication' (particularly whether a manufacturing method must be described) is sometimes explained as differing between novel and known chemical substances.

…In this case, even if the substance known as azithromycin itself was publicly known, a structure in which two water molecules maintain particular positional relationships to one azithromycin molecule through intermolecular forces, forming a dihydrate crystal structure, was not publicly known at least before distribution of Exhibit Ko 2…. It is therefore clear that whether azithromycin dihydrate is described in Exhibit Ko 2 cannot be assessed in the same way as for an ordinary known chemical substance (that is, on the assumption that, even if Exhibit Ko 2 itself does not describe a method of manufacturing or otherwise obtaining azithromycin dihydrate, a person skilled in the art could understand how to obtain it from prior-art documents, common general technical knowledge, and the like). In this sense, azithromycin dihydrate must be treated as a novel chemical substance.

…The Tokyo High Court judgment of October 1, 1991 cited by the plaintiff upheld a JPO finding that, where (R,S) α-cyano-3-phenoxybenzyl alcohol, a racemic compound (racemate) consisting of a pair of optical isomers (enantiomers), is disclosed in a cited reference, the invention of (S) α-cyano-3-phenoxybenzyl alcohol, one of the pair of optical isomers forming that racemate, should be regarded as described in the same reference. However, that assessment was based on the fact that it was common general technical knowledge among persons skilled in the art that various methods of racemic resolution (optical resolution) had been practiced before the patent application for that invention. It therefore cannot be said to hold that a publication never needs to describe the manufacturing method of a product for a product invention to fall under Article 29(1)(iii) of the Patent Act.

(2) As explained in (1) above, to say that a 'product invention' is described in a 'publication' under Article 29(1)(iii) of the Patent Act, before requiring disclosure of the invention's technical idea in the publication, it is first necessary that the product invention's configuration be disclosed. …It is clear that Exhibit Ko 2 contains no express statement that the resulting crystal (Crystal A) is azithromycin dihydrate, or even that it is a hydrate of azithromycin. Nor are the physical-property data stated as 'crystallographic data' such that their description alone makes it easy to recognize Crystal A as azithromycin dihydrate. On the contrary, according to the entire purport of the oral argument, the molecular formula 'C38H72O12N2' and molecular weight 748 (Mr = 748 g/mol) stated at the beginning of the 'crystallographic data' section both relate to anhydrous azithromycin….

…The plaintiff argues that Crystal A described in Exhibit Ko 2 is identified as azithromycin dihydrate because its lattice constants match the values stated in Exhibits Ko 3 and Ko 4 as the lattice constants of azithromycin dihydrate. However, whether Exhibit Ko 2 can be said to disclose the 'configuration of azithromycin dihydrate' concerns whether Exhibit Ko 2 constitutes a publication under Article 29(1)(iii) of the Patent Act. Under that paragraph, for Exhibit Ko 2 to constitute such a publication, it must have been easy to recognize Crystal A described in Exhibit Ko 2 as crystalline azithromycin dihydrate based on the common general technical knowledge or state of the art of a person skilled in the art before filing (…before the priority date in this case…)…. Yet Exhibit Ko 3… and Exhibit Ko 4… were both publications distributed after the priority date in this case…. Accordingly, the knowledge described in those publications does not form part of the common general technical knowledge or state of the art at that priority date. Even if consulting those publications enables a person skilled in the art to recognize easily that Crystal A described in Exhibit Ko 2 is crystalline azithromycin dihydrate, Exhibit Ko 2 cannot be regarded as a publication under Article 29(1)(iii) in relation to the patent application in this case.

The plaintiff argues that Exhibits Ko 3 and Ko 4 are used only to confirm the fact that Crystal A described in Exhibit Ko 2 is a dihydrate, and therefore it is immaterial that Exhibits Ko 3 and Ko 4 themselves were distributed after the priority date. However, as explained above, for Exhibit Ko 2 to constitute a publication under Article 29(1)(iii) of the Patent Act, it must have been easy to recognize Crystal A described there as crystalline azithromycin dihydrate based on the common general technical knowledge or state of the art of a person skilled in the art before…the priority date. Where it is only by relying on common general technical knowledge or the state of the art after the priority date that Crystal A described in Exhibit Ko 2 is first understood to have been crystalline azithromycin dihydrate, Exhibit Ko 2 cannot be regarded as a publication under that item. Furthermore, Exhibits Ko 3 and Ko 4, publications other than Exhibit Ko 2, are relevant only in that the knowledge they describe might form part of the common general technical knowledge or state of the art. Since they were distributed after the priority date and their knowledge does not form part of the common general technical knowledge or state of the art at that date, they cannot affect the assessment of whether Exhibit Ko 2 constitutes a publication under that item in relation to the patent application in this case.

The plaintiff also argues that, in applying Article 29(1)(iii) of the Patent Act, the issue is whether a product identical to the invention existed before the priority date and that this fact is not affected by consulting publications distributed after the priority date. However, application of that item concerns whether, before the priority date, it could be understood that a product identical to the invention was described in Exhibit Ko 2; it does not concern whether a product identical to the invention existed before that date. …

…Neither the replication experiment in Exhibit Ko 7 nor that in Exhibit Ko 17 can be recognized as a replication of the manufacturing method for Crystal A described in Exhibit Ko 2. Nor is there other evidence sufficient to find that, based on common general technical knowledge or the state of the art of a person skilled in the art at the priority date, Crystal A could actually be manufactured from the description of its manufacturing method in Exhibit Ko 2 (that the manufacturing method for Crystal A in Exhibit Ko 2 could be replicated). …It also cannot be found that, at the priority date, Exhibit Ko 2 identified the product azithromycin dihydrate itself through its manufacturing method."

IP High Court, 2010 (Gyo-Ke) No. 10029, […B-Lymphoblastoid Cell Line]

*The cell line described in the cited document was unobtainable. ⇒ Not described

"Before the priority date of the application, Dr. A (and the joint researchers) are found to have had no intention of complying with third-party requests for provision of the L612 cell line. As a result, the L612 cell line was not available to third parties. The JPO decision's finding that 'the L612 cell line described in Cited References 1 and 2 may be presumed to have been in a condition in which it could be provided if a third party requested provision' is erroneous, and that error may affect the conclusion of the decision…."

IP High Court, 2005 (Gyo-Ke) No. 10445, [Nonaqueous Electrolyte Secondary Battery]

*In identifying the cited invention, the court found that the one-line description merely listed a possible battery structure without disclosing its specific configuration, and therefore did not disclose the relevant cited invention.

Cf. 2010 (Gyo-Ke) No. 10324

"…The plaintiff argues… that, based on the statement in Exhibit Ko 1 that '…examples of battery structures include… a cylindrical battery formed by winding a positive electrode, a negative electrode, and, if further required, a separator into a roll,' Exhibit Ko 1 describes the structure of a spiral-wound secondary battery in which strip-shaped positive- and negative-electrode current collectors are laminated with a separator between them and wound many times. The plaintiff argues that this should therefore have been identified as a common feature of the invention in this case and the Exhibit Ko 1 Invention, and that the JPO decision erred in overlooking it and identifying it as Difference (b)…. …

However, an ‘invention described in a publication’ (Patent Act, Article 29(2) and (1)(iii)) that must be identified as a premise for assessing inventive step means an invention understood from matters described in the publication and matters equivalent to those described. ‘Matters equivalent to those described’ means matters that a person skilled in the art (a person having ordinary knowledge in the technical field to which the invention pertains) can derive from matters expressly described in the publication by taking into account common general technical knowledge at the filing date.

Applying this to Exhibit Ko 1, the above passage cited by the plaintiff appears at the end of the section ‘Means and Operation for Solving the Problems’ in the detailed description of the invention. As is clear from the phrases ‘if further required,’ ‘the battery structure is not particularly limited, but,’ and ‘examples include,’ it merely exemplifies battery structures or forms applicable when working the secondary-battery invention described in the claims and cannot be recognized as disclosing a specific embodiment. In other words, even if Exhibit Ko 1 can be said to disclose a cylindrical battery using as its active material the composite oxide and the like described in its claims, it contains no description whatsoever suggesting the specific form of the electrodes in such a cylindrical battery (whether they are long strips rather than short rectangular pieces, whether other forms are possible, etc.) or the specific manner of forming the active material (whether it is formed on both sides, the respective thickness ranges of the positive and negative electrodes, the relationship between the ratio and sum of their thicknesses, etc.). Moreover, even considering all the evidence in this case, it cannot be found that, at the filing date, it was common general technical knowledge to make the electrodes strip-shaped, apply active material to both sides, or set film thickness within a certain range in a cylindrical battery using the composite oxide and the like described in the claims of Exhibit Ko 1 as the active material. Therefore, even taking common general technical knowledge into account, Exhibit Ko 1 cannot be regarded as describing a secondary battery with the configuration… that the plaintiff says should be identified as a common feature of the invention in this case and the Exhibit Ko 1 Invention (strip-shaped positive- and negative-electrode current collectors forming a spiral-wound body). …”

IP High Court, 2012 (Gyo-Ke) No. 10233, [Antibacterial Glass]

*A case denying eligibility as a cited invention to a one-line description.

“…The defendant argues that Cited Reference 1 discloses borosilicate glass, relying on the statement in its detailed description that ‘the soluble glass used in the present invention is at least one type selected from borosilicate and phosphate types’ (paragraph [0006]). However, … since Claim 1 of Cited Reference 1 limits the soluble glass to phosphate glass, the above passage cannot be found to disclose borosilicate glass…. Cited Reference 1 cites Document Otsu 1 as prior art preceding it…, and that document describes both borosilicate glass and phosphate glass as water-soluble glass. However, on the basis of that context, it is unreasonable to understand the ‘soluble glass’ of the Cited Reference 1 Invention, which limits soluble glass to phosphate glass, as including both borosilicate glass and phosphate glass, and that argument cannot be accepted.”

<IP LAB ⑤> “Disclaimer Claims” and “Inventive Step”

Original Ameblo publication: 2024-01-10

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12836021025.html

<IP LAB ⑤>

“Disclaimer Claims” and “Inventive Step”

1. Relationship between addition of new matter through a “disclaimer claim” and inventive-step assessment

IP High Court, 2021 (Gyo-Ke) No. 10151, the “Vessel” case, is the fourth court decision recognizing inventive step through a disclaimer claim, but more than 1,000 disclaimer claims are granted annually in examination and trials/appeals at the JPO.[i]

Like the previous three decisions recognizing “inventive step” through “disclaimer claims,” 2021 (Gyo-Ke) No. 10151 reasoned, in affirming inventive step, that there was an inhibiting factor against excluding the particular configuration in relation to the problem of the primary cited invention.

On the other hand, like numerous other decisions, 2021 (Gyo-Ke) No. 10151 held, when finding that the correction requirements were satisfied because no new matter was added, that the correction by means of a disclaimer claim did not change the operation and effects of the invention in this case.

Thus, “disclaimer claims” contain a twist: when assessing addition of new matter, the relationship to the problem of the invention in question is at issue, whereas when assessing inventive step, the relationship to the problem of the cited invention is at issue. Some have said this is too convenient for right holders.[ii]

Nevertheless, this may be only a minor twist compared with the major twist in current practice whereby, in an inventive-step assessment, a difference between the problem of the invention and that of the cited invention is a reason to affirm inventive step, while in assessing satisfaction of the claim limitations in infringement litigation, it is not asked whether the accused product or method addresses the problem of the invention.[iii]

The author has released a YouTube video titled “Using Disclaimer Claims” on this important issue of “disclaimer claims and inventive step,” which is introduced here. (It does not include decisions issued after the video was made, but the explanation in the video remains the same as of 2023.)

https://www.youtube.com/watch?v=MCoshkBBcRo

2. Assessment of new matter in “disclaimer claims” (different approaches to enlarged prior-application effect and inventive step)

I have the impression that the assessment of new matter in “disclaimer claims” is applied more strictly when an amendment/correction is made to overcome lack of inventive step than when it is made to avoid the enlarged prior-application exclusion. Below I quote the application of the standards in four decisions.

2021 (Gyo-Ke) No. 10151, the “Vessel” case, found that “‘flood-prevention rooms’ are permitted to have a tank function, and thus there are ‘flood-prevention rooms’ that also serve as tanks and those that do not.” It thereby presented substantive reasoning beyond the formal proposition that the effects of the invention are not changed and no new effects are achieved.

2021 (Gyo-Ke) No. 10111, the [Laser Processing Apparatus] case, likewise found that “it would be unnatural deliberately not to depict ‘grooves’ while depicting ‘planned cutting lines,’” thereby presenting substantive reasoning beyond the formal proposition that the effects of the invention are not changed and no new effects are achieved.

In 2018 (Ne) No. 10006, [Method of Operating a System (Capcom v. Koei)], addition of new matter was not a disputed issue.

The first judgment in 2017 (Gyo-Ke) No. 10032, [Method of Manufacturing a Conductive Material (Silver Flakes)], also held: “It cannot be said that the specification, claims, or drawings attached to the application contain no express description that the ‘fusion’ in Corrected Invention 10 in this case arises from ‘locally oxidizing part of said silver particles.’ Therefore… it does not constitute addition of new matter.”

This has something in common with the approach explained in the European Patent Office's guidelines below: a double standard under which the assessment framework for new matter itself is strict for disclaimer claims used to establish inventive step.

“G 1/03: An ‘undisclosed disclaimer’ is permitted only in the following three situations:

1. To restore novelty over prior art under EPC Article 54(3) (corresponding to documents under Article 29bis of the Japanese Patent Act).

2. To restore novelty over accidental prior art.

3. To exclude subject matter that is excluded from patentability for non-technical reasons (for example, treatment methods).

However, it is not permitted in the following situations:

(1) Where it is intended to exclude embodiments that cannot be carried out or to remedy insufficient enablement.

(2) Where it is relevant to inventive step.

(3) Where it also restores novelty over prior art other than earlier-filed, unpublished applications (EPC Article 54(3)) or accidentally anticipating prior art.

(4) Where it removes more subject matter than necessary (G 1/03, G 2/03).” (Quoted from European GW)

[Introduction to Related Decisions (Four Court Decisions and One JPO Decision Recognizing Inventive Step Through Disclaimer Claims)]

≪Decisions Favorable to Right Holders≫

If one excludes the portion relating to the primary reference's principle for solving its problem or its essential part, inventive step can also be recognized!!

● 2021 (Gyo-Ke) No. 10151, “Vessel” <Presiding Judge Shoji>

*Inventive step was recognized by excluding a configuration constituting, or underlying, the primary cited invention's principle for solving its problem, on the logic that there was an inhibiting factor against removing that configuration from the primary cited invention. Specifically, replacing a tank in the primary cited invention that functioned as a ‘flood-prevention room’ with a ‘flood-prevention room’ having no tank function would require new space to accommodate a tank and would prevent the location previously available for tank use from being used as a tank. On those grounds, an inhibiting factor was found and inventive step was recognized.

(Excerpt from the court's reasoning) …The ‘aft trimming tank (ballast water tank)’ of the Exhibit Ko 6 Invention inherently has a tank function. It faces the side wall and is a room with a watertight structure that prevents flooding of the ‘room’ in which it is provided even if that side wall is damaged and flooded. It therefore also constitutes a ‘flood-prevention room’ and is found to be a flood-prevention room that also functions as a tank. However, there is no evidence suggesting that a ‘flood-prevention room’ that also serves as a tank should be constituted separately as a tank and a ‘flood-prevention room’ that does not also serve as a tank. Nor is there evidence suggesting that, at the location of a tank originally designed to perform a tank function and understood also to perform a ‘flood-prevention room’ function, a ‘flood-prevention room’ with no tank function should be placed while a separate tank is placed elsewhere. Therefore, in the Exhibit Ko 6 Invention, no motivation can be found to constitute the ‘aft trimming tank

(ballast water tank)’ separately as a tank and a non-tank ‘flood-prevention room,’ or to replace it with a void serving as a ‘flood-prevention room.’

Furthermore, if a tank and a ‘flood-prevention room’ with no tank function are constituted separately, and a tank originally designed to perform a tank function and understood also to perform a ‘flood-prevention room’ function is replaced with a ‘flood-prevention room’ having no tank function, new space will be required to accommodate a tank, and a location that could previously be used as a tank will no longer be available for tank use. This impairs freedom of design, and there is therefore an inhibiting factor against doing so. Accordingly, it cannot be found that a person skilled in the art could easily have conceived of replacing the ‘aft trimming tank (ballast water tank)’ in the Exhibit Ko 6 Invention with a void serving as a ‘flood-prevention room’ and placing the ‘aft trimming tank (ballast water tank)’ in the room behind it.

● 2021 (Gyo-Ke) No. 10111, [Laser Processing Apparatus] <Presiding Judge Kanno>

*The absence of grooves was discerned from drawings in the specification, and correction by a disclaimer claim was allowed.

(Excerpt from the court's reasoning) …Figures 1 and 3 in the specification and other documents are plan views depicting planned cutting lines on workpiece 1. Neither Figure 2, a cross-section along line II–II in Figure 1, nor Figure 4, a cross-section along line IV–IV in Figure 3, shows any grooves being formed. … Figures 1–4 depict ‘planned cutting lines’ but do not depict ‘grooves.’ If the invention before correction had been premised on the existence of ‘grooves,’ it would have been unnatural deliberately not to depict ‘grooves’ while depicting ‘planned cutting lines.’

…It is inconceivable that a person skilled in the art encountering Document Ko 11 would disregard, from substrate 201, groove portions 203 that create the internal stress used to cut the semiconductor wafer. There is not only no motivation to make a modification adopting, as the workpiece, substrate 201 without grooves along the break line and forming a processing-altered portion inside substrate 201 whose surface has no grooves; rather, there is an inhibiting factor against such modification….

● 2018 (Ne) No. 10006, [Method of Operating a System (Capcom v. Koei)] <Presiding Judge Tsuruoka>

*(Unlike the first-instance judgment,) inventive step was recognized through a ‘disclaimer claim’!! ⇒ Because this is substantively a difference in configuration, the assessment is not unusual.

(Excerpt from the court's reasoning) …If a storage medium incapable of saving ‘character’ and ‘play achievement’ information is adopted, the ‘character’ and ‘play achievement’ information from the earlier game will not be stored on that medium. It is clear that this would make it impossible to implement Publicly Known Invention 1 in this case, namely, ‘playing a later game with a character from an earlier game’ and ‘operating an extended game program in the later game when the earlier character's level is 16 or higher.’ Therefore, … in Publicly Known Invention 1 there is no motivation to change the storage medium to a ‘storage medium (excluding, however, a storage medium capable of storing save data)’ that cannot save game characters or play achievements, and there is an inhibiting factor against adopting such a storage medium.

● 2017 (Gyo-Ke) No. 10032, [Method of Manufacturing a Conductive Material (Silver Flakes)] <Presiding Judge Takabe> — First judgment

*Inventive step was recognized through a ‘disclaimer claim’!! ⇒ The second judgment (Otaka) reached the same conclusion on grounds of binding effect.

(Excerpt from the court's reasoning) …The manufacturing method of Cited Invention 1 differs from the method in Corrected Invention 9 in this case of ‘obtaining a conductive material in which said silver particles fuse at mutually adjacent portions (excluding, however, cases in which the silver flakes fuse only at their ends), and having voids thereby generated.’ …Cited Reference 1 merely discloses a method of sintering silver flakes only at their ends so that the ends fuse. It does not suggest to a person skilled in the

art that selecting the firing atmosphere or other conditions yields a conductive material in which the portions of the silver particles that fuse are portions other than their ends and cases of fusion only at their ends are excluded….

● <JPO> Correction Trial 2017-390031

[Claim 1] …an antibody or antibody derivative (excluding, however, antibody clone AHIX-5041, manufactured by Haematologic Technologies, and antibody clone HIX-1, manufactured by SIGMA-ALDRICH)

⇒ It would not have been obvious to a person skilled in the art to create an antibody that 'increases procoagulant activity' based on the two excluded publicly worked inventions (antibodies).

(Excerpt from the JPO decision) "…No evidence has been presented sufficient to find that these two antibodies were known even to 'increase procoagulant activity.' Furthermore, there is no evidence showing that, at the priority date in this case, it was known that an 'antibody or antibody derivative against factor IX or factor IXa' 'increases procoagulant activity.' Therefore, creating an antibody that 'increases procoagulant activity' based on these two antibodies would not have been obvious to a person skilled in the art, and the invention of corrected Claim 1 has inventive step…." ⇒ Inventive step affirmed

≪Decisions Unfavorable to Right Holders≫

● 2014 (Gyo-Ke) No. 10204, [Transdermal Absorption Preparation] <Presiding Judge Ishii>

*Because the portion excluded by the disclaimer claim was not clear as a product, the correction was held not to constitute a restriction of the scope of claims, and the correction requirements were not satisfied. = 2016 (Gyo-Ke) No. 10160 involving the same parties

[Article] Article 38-2 of the Patent Act (Mamoru Suzuki, Intellectual Property Management, Vol. 73, No. 8, 2023)

Introduced by the 2015 amendment.

A filing date can be secured even without claims.

Unlike a U.S. provisional application, the application itself is examined and must satisfy the disclosure requirements. However, the two are the same insofar as disclosure from the original filing is needed to claim priority.

(Note) Regarding the entry “inducement established, 271(b)” in the first row of the figure above (Power Integrations v. Fairchild Semiconductor), the CAFC vacated the jury’s inducement verdict under 35 U.S.C. § 271(b) and remanded because the jury instructions were erroneous (see the table below).

(Editor's transcription and correction of the figure above)

U.S. inducement decisions

Case	Holding and comparison	Note
2016.12 CAFC, 843 F.3d 1315 Power Integrations v. Fairchild Semiconductor	Inducement requires successful communication from the inducer to the direct infringer and affirmative conduct that leads to direct infringement; merely allowing infringement to occur is insufficient. Evidence of a U.S. technical support center, assistance in locating U.S. distributors, and indemnification against U.S. patent infringement claims could support a finding of intent to induce infringement in the U.S. market. The CAFC nevertheless vacated the inducement verdict under 35 U.S.C. § 271(b) and remanded because the jury instructions were erroneous.	★

Case	Holding and comparison	Note
2018.11 CAFC, 909 F.3d 398 Enplas Display Device v. Seoul Semiconductor	The court upheld induced infringement under § 271(b) involving lighting devices in the United States that incorporated lenses sold abroad. The evidence included an approximately 50% worldwide market share, knowledge that customers sold the finished televisions in the United States, prior joint development with the patentee, notice identifying infringing products found in the United States, and product specifications recommending infringing configurations to customers. Taken together, the evidence supported a finding of specific intent to induce infringement.	★
2015.05 CAFC, 785 F.3d 625 Takeda Pharmaceuticals v. West-Ward Pharmaceutical	At the preliminary injunction stage, the court affirmed denial of relief because Takeda had not shown a likelihood of success on induced infringement. Knowledge of an infringing use does not necessarily establish intent where ambiguous labeling does not necessarily lead physicians to prescribe the drug for the patented use. The court distinguished the instructions and other evidence in ArthroCare v. Smith & Nephew, 406 F.3d 1365 (Fed. Cir. 2005). (The general rule has remained the same since; see Sanofi v. Watson, 875 F.3d 636 (Fed. Cir. 2017).)	★
2010.11 CAFC, 633 F.3d 1042 AstraZeneca v. Apotex	The patent concerned once-daily inhalation. The approved label specified twice-daily administration but also directed gradual reduction to the lowest effective dose once asthma was stable. The product was available only in strengths of 0.25 mg and 0.5 mg per 2 mL vial. Following the titration instructions would necessarily lead some patients to once-daily administration. The CAFC affirmed a preliminary injunction based on a likelihood of success on induced infringement. ⇒ It suffices that a certain proportion of direct infringers are "necessarily led" to infringe; use for the infringing purpose in 100% of cases is not required. At what percentage is inducement established?	★
1998.08 CAFC, 152 F.3d 1342 Johns Hopkins University v. CellPro	The court upheld induced infringement under § 271(b) based on promotion and advertising of a medical device, including statements, made with knowledge of the patent, that the device could achieve the patented purity level. Comparison: the 2020 GlaxoSmithKline v. Teva opinion was replaced by the 2021 panel rehearing opinion. The latter sustained the jury's finding that the partial label still included a patented use and that the carve-out was incomplete, considering the label's specific language together with promotional statements of equivalence to the brand-name drug and other evidence in sustaining the inducement verdict. ≈ Japan: IP High Court, 2005 (Ne) No. 10125 [Cilostazol case (action for compensation for an employee invention)] <Sato>	○
2003.01 CAFC, 316 F.3d 1348 Warner-Lambert v. Apotex	The patents covering the compound and its approved use for epilepsy had expired, while a patent on a different, unapproved use for neurodegenerative diseases remained in force. Because the ANDA sought approval for an unpatented, approved use, the court found no infringement under § 271(e)(2). (* Is this a ruling specific to pharmaceuticals involving the same product?) In dicta, the court explained that the plaintiff's asserted 2.1% rate of off-label use for the patented indication (estimated by the plaintiff at $50 million) did not by itself establish intent to induce infringement under § 271(b). Where substantial noninfringing uses existed and fewer than one in 46 sales were for an infringing use, knowledge that some users might infringe was insufficient. On the record before it, the court could neither infer nor reject an inference of intent from that proportion alone without direct evidence.	★ ★ ★
2003.03 CAFC, 324 F.3d 1322 Allergan v. Alcon	The approved use was reduction of intraocular pressure; the patented, unapproved use was optic-nerve protection or neuroprotection. Applying Warner-Lambert, the court held that § 271(e)(2) was not infringed because Alcon did not seek FDA approval for the patented use. The majority did not decide liability for inducement under § 271(b). The absence of § 271(e)(2) liability from filing the ANDA does not rule out a later § 271(b) claim based on actual post-approval conduct.	△

[Article / United States] Trends in U.S. Induced-Infringement Decisions and Points to Note in Practice (Intellectual Property Management, November 2023)

Original Ameblo publication: 2024-01-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12836524035.html

[Article / United States] Trends in U.S. Induced-Infringement Decisions and Points to Note in Practice (Intellectual Property Management, Vol. 73, No. 11, 2023)

Communication between the inducer and direct infringer + affirmative conduct are required.

In Takeda v. West-Ward, the labeling and other evidence did not establish an intent to induce use for the patented indication, and the likelihood of success on the merits of induced infringement required for a preliminary injunction was not established.

Sales of components outside the United States can constitute induced infringement of a U.S. patent.

Willful blindness

[U.S. Patents] Enplas Display v. Seoul Semiconductor, 909 F.3d 398 (CAFC, November 2018)

Lenses sold outside the United States

⇒ Induced infringement of a U.S. patent concerning a lighting device established

The alleged infringer had a 50% global market share and knew that its customers also sold the finished products in the United States. Evidence that it supplied customers with product specifications recommending infringing configurations also supported the finding.

⇒ Specific intent found!!

2015.05 CAFC (785 F.3d 625) Takeda v. West-Ward Pharm ⇒誘引侵害不成立 271(b)	被疑侵害者（製薬メーカー）が被疑侵害医薬品の侵害用途を知っていたとしても、そのラベルが曖昧で（vague）、必然的に医師が特許発明の用途で処方するわけではない場合には、誘引侵害の意図は認められない。271(b) Arthrocare v. Smith&Nephew 406 F.3d 1365 (Fed. Cir. 2005)事件では、ラベルが特許権侵害を「必然的に導く(necessarily lead)」ものであったから、事案が異なる。（一般論はその後も同じ。Sanofi v. Watson 875 F.3d 636 (Fed. Cir. 2017)）	★
2010.11 CAFC (633 F.3d 1042) AstraZeneca v. Apotex	特許発明は１日１回の処方。被告が承認を得たラベルには１日２回の処方と記載されていたが、喘息が安定したら服用量を徐々に減らすことが推奨されていた。被告医薬品は濃度 0.25mg と 0.5mg しかなかった。医師や患者がラベルの推奨通り服用量を減らすと１日１回服用する者も現れる。⇒治療方法の特許発明の誘引侵害成立。271(b) ⇒一定割合の直接侵害者を「necessarily lead」すれば足り、100%侵害用途で使われることは要件でない。何%で誘引侵害？	★
1998.08 CAFC (152 F.3d 1342) Johns Hopkins University v. Cellpro	医療機器の宣伝・広告で、誘引侵害成立。271(b) ⇒特許発明を知りながら、被告機器を使えば特許発明の純化率を実現できると唱っていた。 ≒CAFC 2020.10 Glaxosmithkline v. Teva（ラベルに特許用途が明記されていなかったが、同等品であると記載されていた。） ＝日本の知財高判平成 17 年(ネ)第 10125 号【シロスタゾール事件（職務発明の対価請求訴訟）】＜佐藤＞	○
2003.01 CAFC（316 F.3d 1348） Warner-Lambert v. Apotex	存続期間満了後の OFF-LABEL USE⇒271(e)(2)不成立（※物が同一である医薬品特有の判決か？） ＜傍論＞特許発明用途の OFF-LABEL USE に 2.1%（5000 万ドル）使われても、誘引侵害不成立。271(b) ⇒特に、製品に非侵害用途が相当程度ある場合、被告がその製品の一部のユーザーが特許を侵害している可能性があることを実際に知っていたとしても、侵害を誘引する意図（intent）を推論することはできない。gabapentinのように、ある製品に多くの用途があり、侵害する用途に用いられる製品販売が46件に1件以下である場合は、直接的な証拠がない限り、Apotex社の意図（intent）を推論することも推論しないこともできない。	★ ★ ★
2003.03 CAFC（324 F.3d 1322） Allergan v. Alcon	特許発明とは別用途の OFF-LABEL USE⇒271(e)(2)不成立（※特許発明は緑内障。被疑侵害者の商品は眼圧低下。） Warner-Lambert の先例に基づき、FDA に特許発明の用途で承認を求めていないことから、被告 Alcon 有利な略式判決。（多数意見は 271(b)の誘引侵害を検討していない。271(e)(2)をクリアしても、ANDA 承認後 271(b)が更に争われる。）	△

(Note) Regarding the entry “inducement established, 271(b)” in the first row of the figure above (Power Integrations v. Fairchild Semiconductor), the CAFC vacated the jury’s inducement verdict under 35 U.S.C. § 271(b) and remanded because the jury instructions were erroneous (see the table below).

(Editor's transcription and correction of the figure above)

U.S. inducement decisions

Case	Holding and comparison	Note
2016.12 CAFC, 843 F.3d 1315 Power Integrations v. Fairchild Semiconductor	Inducement requires successful communication from the inducer to the direct infringer and affirmative conduct that leads to direct infringement; merely allowing infringement to occur is insufficient. Evidence of a U.S. technical support center, assistance in locating U.S. distributors, and indemnification against U.S. patent infringement claims could support a finding of intent to induce infringement in the U.S. market. The CAFC nevertheless vacated the inducement verdict under 35 U.S.C. § 271(b) and remanded because the jury instructions were erroneous.	★

Case	Holding and comparison	Note
2018.11 CAFC, 909 F.3d 398 Enplas Display Device v. Seoul Semiconductor	The court upheld induced infringement under § 271(b) involving lighting devices in the United States that incorporated lenses sold abroad. The evidence included an approximately 50% worldwide market share, knowledge that customers sold the finished televisions in the United States, prior joint development with the patentee, notice identifying infringing products found in the United States, and product specifications recommending infringing configurations to customers. Taken together, the evidence supported a finding of specific intent to induce infringement.	★
2015.05 CAFC, 785 F.3d 625 Takeda Pharmaceuticals v. West-Ward Pharmaceutical	At the preliminary injunction stage, the court affirmed denial of relief because Takeda had not shown a likelihood of success on induced infringement. Knowledge of an infringing use does not necessarily establish intent where ambiguous labeling does not necessarily lead physicians to prescribe the drug for the patented use. The court distinguished the instructions and other evidence in ArthroCare v. Smith & Nephew, 406 F.3d 1365 (Fed. Cir. 2005). (The general rule has remained the same since; see Sanofi v. Watson, 875 F.3d 636 (Fed. Cir. 2017).)	★
2010.11 CAFC, 633 F.3d 1042 AstraZeneca v. Apotex	The patent concerned once-daily inhalation. The approved label specified twice-daily administration but also directed gradual reduction to the lowest effective dose once asthma was stable. The product was available only in strengths of 0.25 mg and 0.5 mg per 2 mL vial. Following the titration instructions would necessarily lead some patients to once-daily administration. The CAFC affirmed a preliminary injunction based on a likelihood of success on induced infringement. ⇒ It suffices that a certain proportion of direct infringers are "necessarily led" to infringe; use for the infringing purpose in 100% of cases is not required. At what percentage is inducement established?	★
1998.08 CAFC, 152 F.3d 1342 Johns Hopkins University v. CellPro	The court upheld induced infringement under § 271(b) based on promotion and advertising of a medical device, including statements, made with knowledge of the patent, that the device could achieve the patented purity level. Comparison: the 2020 GlaxoSmithKline v. Teva opinion was replaced by the 2021 panel rehearing opinion. The latter sustained the jury's finding that the partial label still included a patented use and that the carve-out was incomplete, considering the label's specific language together with promotional statements of equivalence to the brand-name drug and other evidence in sustaining the inducement verdict. ≈ Japan: IP High Court, 2005 (Ne) No. 10125 [Cilostazol case (action for compensation for an employee invention)] <Sato>	○
2003.01 CAFC, 316 F.3d 1348 Warner-Lambert v. Apotex	The patents covering the compound and its approved use for epilepsy had expired, while a patent on a different, unapproved use for neurodegenerative diseases remained in force. Because the ANDA sought approval for an unpatented, approved use, the court found no infringement under § 271(e)(2). (* Is this a ruling specific to pharmaceuticals involving the same product?) In dicta, the court explained that the plaintiff's asserted 2.1% rate of off-label use for the patented indication (estimated by the plaintiff at $50 million) did not by itself establish intent to induce infringement under § 271(b). Where substantial noninfringing uses existed and fewer than one in 46 sales were for an infringing use, knowledge that some users might infringe was insufficient. On the record before it, the court could neither infer nor reject an inference of intent from that proportion alone without direct evidence.	★ ★ ★
2003.03 CAFC, 324 F.3d 1322 Allergan v. Alcon	The approved use was reduction of intraocular pressure; the patented, unapproved use was optic-nerve protection or neuroprotection. Applying Warner-Lambert, the court held that § 271(e)(2) was not infringed because Alcon did not seek FDA approval for the patented use. The majority did not decide liability for inducement under § 271(b). The absence of § 271(e)(2) liability from filing the ANDA does not rule out a later § 271(b) claim based on actual post-approval conduct.	△

[U.S. Patents] Power Integrations v. Fairchild, 843 F.3d 1315 (CAFC, December 2016)

[U.S. Patents] Power Integrations v. Fairchild, 843 F.3d 1315 (CAFC, December 2016)

For induced infringement to be established,

① Successful communication between the inducer and the direct infringer is required

+

② Mere inaction in allowing patent infringement to continue is insufficient; an affirmative act affecting the acts of practicing the invention is required.

[U.S. Patents] Power Integrations v. Fairchild (CAFC, December 2016)

Original Ameblo publication: 2024-01-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12836900393.html

[U.S. Patents] Power Integrations v. Fairchild (CAFC, December 2016)

① Established a technical support center in the United States.

② Enabled customers to find U.S. distributors.

③ Indemnified customers against claims of U.S. patent infringement in its standard terms.

⇒ Sales activities targeting the U.S. market were evidence from which intent to induce infringement could be found. However, the induced-infringement verdict was vacated because of an erroneous jury instruction, and the case was remanded.

Where substantial noninfringing uses existed and fewer than one in 46 sales were for an infringing use, knowledge that some users might infringe was insufficient. On the record before it, the court could neither infer nor reject an inference of intent from that proportion alone without direct evidence.	★ ★ ★
2003.03 CAFC, 324 F.3d 1322 Allergan v. Alcon	The approved use was reduction of intraocular pressure; the patented, unapproved use was optic-nerve protection or neuroprotection. Applying Warner-Lambert, the court held that § 271(e)(2) was not infringed because Alcon did not seek FDA approval for the patented use. The majority did not decide liability for inducement under § 271(b). The absence of § 271(e)(2) liability from filing the ANDA does not rule out a later § 271(b) claim based on actual post-approval conduct.	△

[United States] Takeda v. West-Ward, 785 F.3d 625 (CAFC 2015)

Original Ameblo publication: 2024-01-18

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12837091724.html

[United States] Takeda v. West-Ward, 785 F.3d 625 (CAFC 2015)

In this case, the labeling and other evidence did not establish an intent to induce use for the patented indication, and the likelihood of success on the merits of induced infringement required for a preliminary injunction was not established.

Cf. The Arthrocare case (CAFC 2005) involved 'necessarily lead.'

2016.12 CAFC (843 F.3d 1315) Power Integrations v. Fairchild Semiconductor	誘引侵害には、＜1＞誘印者と直接侵害者（被誘引者）との間で意思疎通（successful communication）が必要である。＋＜2＞特許権侵害行為を放置するという不作為では足りず、第三者（直接侵害者（被誘引者））の実施行為に影響を与える積極的な行為（Affirmative act）が必要である。 ⇒米国にテクニカルサポートセンターを設置したことに加え、顧客が米国販売代理店を見つけることを可能にし、標準約款で米国特許の侵害に対するクレームから顧客を補償していた。⇒米国市場をターゲットとしたものであり、誘引侵害成立。271(b)	★
2018.11 CAFC (909 F.3d 398) Enplas Display v. Seoul Semiconductor	米国外でレンズ販売⇒照明装置に係る米国特許の誘引侵害成立。271(b) 被疑侵害者の世界市場シェアが５０％を有しており、被疑侵害者の顧客が米国でも最終製品（テレビ）を販売していることを知っていた以上、「specific intent to induce infringement」を認めた。	★
2015.05 CAFC (785 F.3d 625) Takeda v. West-Ward Pharm ⇒誘引侵害不成立 271(b)	被疑侵害者（製薬メーカー）が被疑侵害医薬品の侵害用途を知っていたとしても、そのラベルが曖昧で（vague）、必然的に医師が特許発明の用途で処方するわけではない場合には、誘引侵害の意図は認められない。271(b) Arthrocare v. Smith&Nephew 406 F.3d 1365 (Fed. Cir. 2005)事件では、ラベルが特許権侵害を「必然的に導く(necessarily lead)」ものであったから、事案が異なる。（一般論はその後も同じ。Sanofi v. Watson 875 F.3d 636 (Fed. Cir. 2017)）	★
2010.11 CAFC (633 F.3d 1042) AstraZeneca v. Apotex	特許発明は１日１回の処方。被告が承認を得たラベルには１日２回の処方と記載されていたが、喘息が安定したら服用量を徐々に減らすことが推奨されていた。被告医薬品は濃度 0.25mg と 0.5mg しかなかった。医師や患者がラベルの推奨通り服用量を減らすと１日１回服用する者も現れる。⇒治療方法の特許発明の誘引侵害成立。271(b) ⇒一定割合の直接侵害者を「necessarily lead」すれば足り、100%侵害用途で使われることは要件でない。何%で誘引侵害？	★
1998.08 CAFC (152 F.3d 1342) Johns Hopkins University v. Cellpro	医療機器の宣伝・広告で、誘引侵害成立。271(b) ⇒特許発明を知りながら、被告機器を使えば特許発明の純化率を実現できると唱っていた。 ≒CAFC 2020.10 Glaxosmithkline v. Teva（ラベルに特許用途が明記されていなかったが、同等品であると記載されていた。） ＝日本の知財高判平成 17 年(ネ)第 10125 号【シロスタゾール事件（職務発明の対価請求訴訟）】＜佐藤＞	○
2003.01 CAFC（316 F.3d 1348） Warner-Lambert v. Apotex	存続期間満了後の OFF-LABEL USE⇒271(e)(2)不成立（※物が同一である医薬品特有の判決か？） ＜傍論＞特許発明用途の OFF-LABEL USE に 2.1%（5000 万ドル）使われても、誘引侵害不成立。271(b) ⇒特に、製品に非侵害用途が相当程度ある場合、被告がその製品の一部のユーザーが特許を侵害している可能性があることを実際に知っていたとしても、侵害を誘引する意図（intent）を推論することはできない。gabapentinのように、ある製品に多くの用途があり、侵害する用途に用いられる製品販売が46件に1件以下である場合は、直接的な証拠がない限り、Apotex社の意図（intent）を推論することも推論しないこともできない。	★ ★ ★
2003.03 CAFC（324 F.3d 1322） Allergan v. Alcon	特許発明とは別用途の OFF-LABEL USE⇒271(e)(2)不成立（※特許発明は緑内障。被疑侵害者の商品は眼圧低下。） Warner-Lambert の先例に基づき、FDA に特許発明の用途で承認を求めていないことから、被告 Alcon 有利な略式判決。（多数意見は 271(b)の誘引侵害を検討していない。271(e)(2)をクリアしても、ANDA 承認後 271(b)が更に争われる。）	△

(Note) Regarding the entry "inducement established, 271(b)" in the first row of the figure above (Power Integrations v. Fairchild Semiconductor), the CAFC vacated the jury's inducement verdict under 35 U.S.C. § 271(b) and remanded because the jury instructions were erroneous (see the table below).

(Editor's transcription and correction of the figure above)

U.S. inducement decisions

Case	Holding and comparison	Note
2016.12 CAFC, 843 F.3d 1315 Power Integrations v. Fairchild Semiconductor	Inducement requires successful communication from the inducer to the direct infringer and affirmative conduct that leads to direct infringement; merely allowing infringement to occur is insufficient. Evidence of a U.S. technical support center, assistance in locating U.S. distributors, and indemnification against U.S. patent infringement claims could support a finding of intent to induce infringement in the U.S. market. The CAFC nevertheless vacated the inducement verdict under 35 U.S.C. § 271(b) and remanded because the jury instructions were erroneous.	★

Case	Holding and comparison	Note
2018.11 CAFC, 909 F.3d 398 Enplas Display Device v. Seoul Semiconductor	The court upheld induced infringement under § 271(b) involving lighting devices in the United States that incorporated lenses sold abroad. The evidence included an approximately 50% worldwide market share, knowledge that customers sold the finished televisions in the United States, prior joint development with the patentee, notice identifying infringing products found in the United States, and product specifications recommending infringing configurations to customers. Taken together, the evidence supported a finding of specific intent to induce infringement.	★
2015.05 CAFC, 785 F.3d 625 Takeda Pharmaceuticals v. West-Ward Pharmaceutical	At the preliminary injunction stage, the court affirmed denial of relief because Takeda had not shown a likelihood of success on induced infringement. Knowledge of an infringing use does not necessarily establish intent where ambiguous labeling does not necessarily lead physicians to prescribe the drug for the patented use. The court distinguished the instructions and other evidence in ArthroCare v. Smith & Nephew, 406 F.3d 1365 (Fed. Cir. 2005). (The general rule has remained the same since; see Sanofi v. Watson, 875 F.3d 636 (Fed. Cir. 2017).)	★
2010.11 CAFC, 633 F.3d 1042 AstraZeneca v. Apotex	The patent concerned once-daily inhalation. The approved label specified twice-daily administration but also directed gradual reduction to the lowest effective dose once asthma was stable. The product was available only in strengths of 0.25 mg and 0.5 mg per 2 mL vial. Following the titration instructions would necessarily lead some patients to once-daily administration. The CAFC affirmed a preliminary injunction based on a likelihood of success on induced infringement. ⇒ It suffices that a certain proportion of direct infringers are "necessarily led" to infringe; use for the infringing purpose in 100% of cases is not required. At what percentage is inducement established?	★
1998.08 CAFC, 152 F.3d 1342 Johns Hopkins University v. CellPro	The court upheld induced infringement under § 271(b) based on promotion and advertising of a medical device, including statements, made with knowledge of the patent, that the device could achieve the patented purity level. Comparison: the 2020 GlaxoSmithKline v. Teva opinion was replaced by the 2021 panel rehearing opinion. The latter sustained the jury's finding that the partial label still included a patented use and that the carve-out was incomplete, considering the label's specific language together with promotional statements of equivalence to the brand-name drug and other evidence in sustaining the inducement verdict. ≈ Japan: IP High Court, 2005 (Ne) No. 10125 [Cilostazol case (action for compensation for an employee invention)] <Sato>	○
2003.01 CAFC, 316 F.3d 1348 Warner-Lambert v. Apotex	The patents covering the compound and its approved use for epilepsy had expired, while a patent on a different, unapproved use for neurodegenerative diseases remained in force. Because the ANDA sought approval for an unpatented, approved use, the court found no infringement under § 271(e)(2). (* Is this a ruling specific to pharmaceuticals involving the same product?) In dicta, the court explained that the plaintiff's asserted 2.1% rate of off-label use for the patented indication (estimated by the plaintiff at $50 million) did not by itself establish intent to induce infringement under § 271(b). Where substantial noninfringing uses existed and fewer than one in 46 sales were for an infringing use, knowledge that some users might infringe was insufficient. On the record before it, the court could neither infer nor reject an inference of intent from that proportion alone without direct evidence.	★ ★ ★
2003.03 CAFC, 324 F.3d 1322 Allergan v. Alcon	The approved use was reduction of intraocular pressure; the patented, unapproved use was optic-nerve protection or neuroprotection. Applying Warner-Lambert, the court held that § 271(e)(2) was not infringed because Alcon did not seek FDA approval for the patented use. The absence of § 271(e)(2) liability from filing the ANDA does not rule out a later § 271(b) claim based on actual post-approval conduct.	△

[United States] 2010 CAFC (633 F.3d 1042) AstraZeneca v. Apotex

Original Ameblo publication: 2024-01-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12837155552.html

[United States] 2010 CAFC (633 F.3d 1042) AstraZeneca v. Apotex

Preliminary injunction affirmed based on a likelihood of success on induced infringement (treatment method)

Cf. Takeda v. West-Ward, 785 F.3d 625 (CAFC 2015)

The patented invention called for once-daily dosing.

The defendant's label stated twice daily, but recommended gradual dose reduction.

The defendant’s drug was available in only two strengths: 0.25 mg and 0.5 mg per 2 mL vial.

If physicians or patients reduced the dose administered by inhalation in accordance with the label’s recommendation, some patients would receive the drug by inhalation once daily.

Watson, 875 F.3d 636 (Fed. Cir. 2017).)	★
2010.11 CAFC, 633 F.3d 1042 AstraZeneca v. Apotex	The patent concerned once-daily inhalation. The approved label specified twice-daily administration but also directed gradual reduction to the lowest effective dose once asthma was stable. The product was available only in strengths of 0.25 mg and 0.5 mg per 2 mL vial. Following the titration instructions would necessarily lead some patients to once-daily administration. The CAFC affirmed a preliminary injunction based on a likelihood of success on induced infringement. ⇒ It suffices that a certain proportion of direct infringers are "necessarily led" to infringe; use for the infringing purpose in 100% of cases is not required. At what percentage is inducement established?	★
1998.08 CAFC, 152 F.3d 1342 Johns Hopkins University v. CellPro	The court upheld induced infringement under § 271(b) based on promotion and advertising of a medical device, including statements, made with knowledge of the patent, that the device could achieve the patented purity level. Comparison: the 2020 GlaxoSmithKline v. Teva opinion was replaced by the 2021 panel rehearing opinion. The latter sustained the jury's finding that the partial label still included a patented use and that the carve-out was incomplete, considering the label's specific language together with promotional statements of equivalence to the brand-name drug and other evidence in sustaining the inducement verdict. ≈ Japan: IP High Court, 2005 (Ne) No. 10125 [Cilostazol case (action for compensation for an employee invention)] <Sato>	○
2003.01 CAFC, 316 F.3d 1348 Warner-Lambert v. Apotex	The patents covering the compound and its approved use for epilepsy had expired, while a patent on a different, unapproved use for neurodegenerative diseases remained in force. Because the ANDA sought approval for an unpatented, approved use, the court found no infringement under § 271(e)(2). (* Is this a ruling specific to pharmaceuticals involving the same product?) In dicta, the court explained that the plaintiff's asserted 2.1% rate of off-label use for the patented indication (estimated by the plaintiff at $50 million) did not by itself establish intent to induce infringement under § 271(b). Where substantial noninfringing uses existed and fewer than one in 46 sales were for an infringing use, knowledge that some users might infringe was insufficient. On the record before it, the court could neither infer nor reject an inference of intent from that proportion alone without direct evidence.	★ ★ ★
2003.03 CAFC, 324 F.3d 1322 Allergan v. Alcon	The approved use was reduction of intraocular pressure; the patented, unapproved use was optic-nerve protection or neuroprotection. Applying Warner-Lambert, the court held that § 271(e)(2) was not infringed because Alcon did not seek FDA approval for the patented use. The majority did not decide liability for inducement under § 271(b). The absence of § 271(e)(2) liability from filing the ANDA does not rule out a later § 271(b) claim based on actual post-approval conduct.	△

Original Ameblo publication: 2024-01-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12837408488.html

[United States] 2003 CAFC (316 F.3d 1348) Warner-Lambert v. Apotex

Section 271(e)(2) infringement not established

+

<Obiter dictum> The court held that, even assuming the plaintiff's estimate that use for the patented indication accounted for 2.1% and represented $50 million in sales was correct, that circumstance alone was insufficient to establish induced infringement for a drug that also had noninfringing uses, as in this case.

*Fewer than one in 46 sales were for the infringing use.

The determination concerned the evidence in this case and did not generally exclude proof of intent to induce infringement by circumstantial evidence.

U.S. inducement decisions

Case	Holding and comparison	Note
2016.12 CAFC, 843 F.3d 1315 Power Integrations v. Fairchild Semiconductor	Inducement requires successful communication from the inducer to the direct infringer and affirmative conduct that leads to direct infringement; merely allowing infringement to occur is insufficient. Evidence of a U.S. technical support center, assistance in locating U.S. distributors, and indemnification against U.S. patent infringement claims could support a finding of intent to induce infringement in the U.S. market. The CAFC nevertheless vacated the inducement verdict under 35 U.S.C. § 271(b) and remanded because the jury instructions were erroneous.	★
2018.11 CAFC, 909 F.3d 398 Enplas Display Device v. Seoul Semiconductor	The court upheld induced infringement under § 271(b) involving lighting devices in the United States that incorporated lenses sold abroad. The evidence included an approximately 50% worldwide market share, knowledge that customers sold the finished televisions in the United States, prior joint development with the patentee, notice identifying infringing products found in the United States, and product specifications recommending infringing configurations to customers. Taken together, the evidence supported a finding of specific intent to induce infringement.	★
2015.05 CAFC, 785 F.3d 625 Takeda Pharmaceuticals v. West-Ward Pharmaceutical	At the preliminary injunction stage, the court affirmed denial of relief because Takeda had not shown a likelihood of success on induced infringement. Knowledge of an infringing use does not necessarily establish intent where ambiguous labeling does not necessarily lead physicians to prescribe the drug for the patented use. The court distinguished the instructions and other evidence in ArthroCare v. Smith & Nephew, 406 F.3d 1365 (Fed. Cir. 2005). (The general rule has remained the same since; see Sanofi v. Watson, 875 F.3d 636 (Fed. Cir. 2017).)	★
2010.11 CAFC, 633 F.3d 1042 AstraZeneca v. Apotex	The patent concerned once-daily inhalation. The approved label specified twice-daily administration but also directed gradual reduction to the lowest effective dose once asthma was stable. The product was available only in strengths of 0.25 mg and 0.5 mg per 2 mL vial. Following the titration instructions would necessarily lead some patients to once-daily administration. The CAFC affirmed a preliminary injunction based on a likelihood of success on induced infringement. ⇒ It suffices that a certain proportion of direct infringers are "necessarily led" to infringe; use for the infringing purpose in 100% of cases is not required. Apotex	存続期間満了後の OFF-LABEL USE⇒271(e)(2)不成立（※物が同一である医薬品特有の判決か？） ＜傍論＞特許発明用途の OFF-LABEL USE に 2.1%（5000 万ドル）使われても、誘引侵害不成立。271(b) ⇒特に、製品に非侵害用途が相当程度ある場合、被告がその製品の一部のユーザーが特許を侵害している可能性があることを実際に知っていたとしても、侵害を誘引する意図（intent）を推論することはできない。gabapentinのように、ある製品に多くの用途があり、侵害する用途に用いられる製品販売が46件に1件以下である場合は、直接的な証拠がない限り、Apotex社の意図（intent）を推論することも推論しないこともできない。	★ ★ ★
2003.03 CAFC（324 F.3d 1322） Allergan v. Alcon	特許発明とは別用途の OFF-LABEL USE⇒271(e)(2)不成立（※特許発明は緑内障。被疑侵害者の商品は眼圧低下。） Warner-Lambert の先例に基づき、FDA に特許発明の用途で承認を求めていないことから、被告 Alcon 有利な略式判決。（多数意見は 271(b)の誘引侵害を検討していない。271(e)(2)をクリアしても、ANDA 承認後 271(b)が更に争われる。）	△

(Note) Regarding the entry "inducement established, 271(b)" in the first row of the figure above (Power Integrations v. Fairchild Semiconductor), the CAFC vacated the jury's inducement verdict under 35 U.S.C. § 271(b) and remanded because the jury instructions were erroneous (see the table below).

(Editor's transcription and correction of the figure above)

U.S. inducement decisions

Case	Holding and comparison	Note
2016.12 CAFC, 843 F.3d 1315 Power Integrations v. Fairchild Semiconductor	Inducement requires successful communication from the inducer to the direct infringer and affirmative conduct that leads to direct infringement; merely allowing infringement to occur is insufficient. Evidence of a U.S. technical support center, assistance in locating U.S. distributors, and indemnification against U.S. patent infringement claims could support a finding of intent to induce infringement in the U.S. market. The CAFC nevertheless vacated the inducement verdict under 35 U.S.C. § 271(b) and remanded because the jury instructions were erroneous.	★

Case	Holding and comparison	Note
2018.11 CAFC, 909 F.3d 398 Enplas Display Device v. Seoul Semiconductor	The court upheld induced infringement under § 271(b) involving lighting devices in the United States that incorporated lenses sold abroad. The evidence included an approximately 50% worldwide market share, knowledge that customers sold the finished televisions in the United States, prior joint development with the patentee, notice identifying infringing products found in the United States, and product specifications recommending infringing configurations to customers. Taken together, the evidence supported a finding of specific intent to induce infringement.	★
2015.05 CAFC, 785 F.3d 625 Takeda Pharmaceuticals v. West-Ward Pharmaceutical	At the preliminary injunction stage, the court affirmed denial of relief because Takeda had not shown a likelihood of success on induced infringement. Knowledge of an infringing use does not necessarily establish intent where ambiguous labeling does not necessarily lead physicians to prescribe the drug for the patented use. The court distinguished the instructions and other evidence in ArthroCare v. Smith & Nephew, 406 F.3d 1365 (Fed. Cir. 2005). (The general rule has remained the same since; see Sanofi v. Watson, 875 F.3d 636 (Fed. Cir. 2017).)	★
2010.11 CAFC, 633 F.3d 1042 AstraZeneca v. Apotex	The patent concerned once-daily inhalation. The approved label specified twice-daily administration but also directed gradual reduction to the lowest effective dose once asthma was stable. The product was available only in strengths of 0.25 mg and 0.5 mg per 2 mL vial. Following the titration instructions would necessarily lead some patients to once-daily administration. The CAFC affirmed a preliminary injunction based on a likelihood of success on induced infringement. ⇒ It suffices that a certain proportion of direct infringers are "necessarily led" to infringe; use for the infringing purpose in 100% of cases is not required. At what percentage is inducement established?	★
1998.08 CAFC, 152 F.3d 1342 Johns Hopkins University v. CellPro	The court upheld induced infringement under § 271(b) based on promotion and advertising of a medical device, including statements, made with knowledge of the patent, that the device could achieve the patented purity level. Comparison: the 2020 GlaxoSmithKline v. Teva opinion was replaced by the 2021 panel rehearing opinion. The latter sustained the jury's finding that the partial label still included a patented use and that the carve-out was incomplete, considering the label's specific language together with promotional statements of equivalence to the brand-name drug and other evidence in sustaining the inducement verdict. ≈ Japan: IP High Court, 2005 (Ne) No. 10125 [Cilostazol case (action for compensation for an employee invention)] <Sato>	○
2003.01 CAFC, 316 F.3d 1348 Warner-Lambert v. Apotex	The patents covering the compound and its approved use for epilepsy had expired, while a patent on a different, unapproved use for neurodegenerative diseases remained in force. Because the ANDA sought approval for an unpatented, approved use, the court found no infringement under § 271(e)(2). (* Is this a ruling specific to pharmaceuticals involving the same product?) In dicta, the court explained that the plaintiff's asserted 2.1% rate of off-label use for the patented indication (estimated by the plaintiff at $50 million) did not by itself establish intent to induce infringement under § 271(b). Where substantial noninfringing uses existed and fewer than one in 46 sales were for an infringing use, knowledge that some users might infringe was insufficient. On the record before it, the court could neither infer nor reject an inference of intent from that proportion alone without direct evidence.	★ ★ ★
2003.03 CAFC, 324 F.3d 1322 Allergan v. Alcon	The approved use was reduction of intraocular pressure; the patented, unapproved use was optic-nerve protection or neuroprotection. Applying Warner-Lambert, the court held that § 271(e)(2) was not infringed because Alcon did not seek FDA approval for the patented use. The majority did not decide liability for inducement under § 271(b). The absence of § 271(e)(2) liability from filing the ANDA does not rule out a later § 271(b) claim based on actual post-approval conduct.	△

[Statistical Data] Percentage of Patent Rights Remaining in Force

Original Ameblo publication: 2024-01-31

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12838692023.html

[Statistical Data] Percentage of Patent Rights Remaining in Force

The percentages are 70% eight years after registration, 64% at nine years, 57% at ten years, 45% at eleven years, and 35% at twelve years.

(Note) The years are counted from registration. Because the patent term ends 20 years from the filing date (Article 67(1) of the Patent Act), patents expire before 20 years have passed from registration.

With annual fees gradually increasing, the trend is as expected.

This can inform decisions on pruning a patent portfolio.

https://www.e-stat.go.jp/stat-search/file-download?fileKind=2&statInfId=000040077880

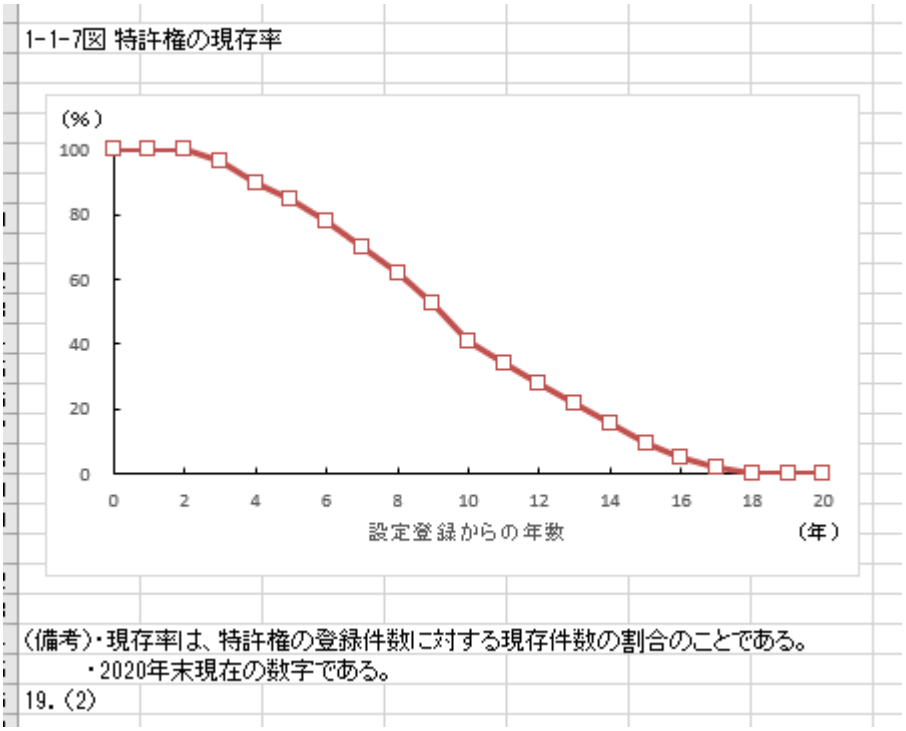

Figure 1-1-7. Percentage of patents remaining in force

Vertical axis: percentage (%), from 0 to 100. Horizontal axis: number of years since registration (years), from 0 to 20.

(Note) The percentage remaining in force is the ratio of the number of patents currently in force to the number of registrations. The figures are as of the end of 2020.

[Statistics] Statistics on Patent Infringement Litigation (Tokyo and Osaka District Courts, 2014–2022)

IP High Court, 2023 (Gyo-Ke) No. 10014 [Navigation Device] <Shoji> * Addition of claim language held to constitute a substantive change

Original Ameblo publication: 2024-02-07

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12839638977.html

2023 (Gyo-Ke) No. 10014 [Navigation Device] <Shoji>

* Adding language to the claim was held to constitute a substantive change!!

By adding the words “of candidate points,” the correction removes the “restriction” on the “points” for which location information can be obtained and … can be said to delete part of the matters defining the invention.

(Excerpt from the judgment)

(2) Whether the matters corrected substantially change the scope of the claims

A. Article 126(6) of the Patent Act is intended to prevent unforeseen disadvantages to third parties that could arise if an invention excluded from the scope of the claims before correction were to be included within the scope after correction. Accordingly, whether a correction “substantially enlarges or changes the scope of the claims” within the meaning of that provision should be determined by reference to the meaning of the claims before and after correction, and whether an enlargement or change is “substantial” should be decided from the standpoint of whether the correction would cause unforeseen disadvantages to third parties.

B. Interpretation of the terminology in the specification

Applying this to the present case, both before and after the correction, according to the language of the claims for the invention of claim 1, the candidate points displayed as symbols on the map screen are “candidate points” after extraction by the candidate-extraction means, whereas the location information that can be obtained by the location-information acquisition means concerns “points”; the “points” for which it can be obtained are restricted to the “locations” corresponding to the symbols.

Terminology in a specification must be used in its ordinary meaning and consistently throughout the specification and claims (Article 24 of the Regulations under the Patent Act; Note 8 to Form No. 29). From this standpoint, the meaning of the terms in the present specification is examined below.

First, “point” in the specification is understood to mean any place within the geographical area displayed on the map screen, including places not displayed as symbols, in view of the statements “set points such as waypoints” (paragraphs [0003] and [0004]), “this conventional navigation device obtains location information for a desired point from the map screen displayed on the display device” (paragraph [0005]), “obtains location information for the target location by designating a point with a cursor on the map screen” (paragraph [0030]), “even on a large-scale map screen, an unnecessary point will not be set by mistake” (paragraph [0040]), and “location information cannot be obtained for points other than those corresponding to symbols on the map screen” (paragraph [0042]).

Next, “location” in the specification is used to refer to a “point’s geographical position on Earth,” as in the statements “when candidate points are displayed in a list and the user selects a candidate point from among them, the user cannot confirm the location of the candidate point on the map” (paragraph [0003]) and “when symbols are displayed in this way, while they remain displayed, the points for which location information can be obtained are restricted to locations corresponding to the symbols, and location information can no longer be obtained for other locations” (paragraph [0007]). It is also used to refer to the

“vehicle’s current position,” as in “the vehicle’s current location and the destination” (paragraph [0002]) and “measure the vehicle’s location using artificial satellites” (paragraph [0024]). In either case, it is understood to refer to their geographical positions on Earth.

Further, “location information” in the specification is understood to mean information representing a location in the real world, rather than a location on the map screen (screen coordinates), as is clear from the statements “the storage unit 41 [stores] current-location information output from the current-location detection unit 11” (paragraph [0029]) and “in step S101 of Fig. 5, a map screen is displayed on the display device 51; in step S102, location information for the destination is obtained through destination-setting processing; in the subsequent step S103, a route search is performed on the basis of the location information for the current location and destination; and in step S104, the searched route is displayed on the map screen. At this time, for example, as shown in Fig. 8, a cursor c indicating the current location o and a mark indicating the destination p are displayed on the map screen together with multiple candidate routes. The user then selects the desired route R1 as appropriate” (paragraph [0032]). Where this refers to location information for points, it clearly includes the destination, in light of the foregoing statement “on the basis of the location information for the current location and destination” (paragraph [0032]).

C. Meaning of the invention of claim 1 before the correction

On the basis of the meanings of the above terms, the meaning of the invention of claim 1 before the correction is examined.

The [Means for Solving the Problem] section of the detailed description of the invention in the specification states: “The invention of claim 1, which solves the above problem, … when location information for a target point is obtained from the map screen of the display means, narrows down candidate points using the candidate-extraction means and displays the extracted candidate points as symbols on the map screen. When symbols are displayed in this way, while they remain displayed, the points for which location information can be obtained are restricted to locations corresponding to the symbols, and location information can no longer be obtained for other locations” (paragraph [0007]). The statement in paragraph [0007] that “the points for which location information can be obtained are restricted to locations corresponding to the symbols, and location information can no longer be obtained for other locations” is understood to have the same meaning as the claim 1 language “restrict the points for which location information can be obtained by the location-information acquisition means to locations corresponding to the symbols.” As for its meaning, given that “point” in the specification means any place within the geographical area displayed on the map screen, including places not displayed as symbols, the location-information acquisition means could previously obtain location information for any such point displayed on the map screen, but, while symbols are displayed as candidate points on the display screen, the locations for which information representing a real-world location can be obtained are restricted to those corresponding to the symbols, so location information for other points displayed on the screen can no longer be obtained.

Thus, in the invention of claim 1 before correction, while candidate points are displayed as symbols, the points for which location information can be obtained are limited to locations corresponding to those symbols, and location information for other points cannot be obtained. This is also clear from the [Effects of the Invention] section of the detailed description, which states: “According to the invention of claim 1, the candidate-extraction means narrows down candidate points and displays the narrowed-down candidate points as symbols on the map screen, and, while those symbols are displayed, restricts the points for which location information can be obtained to locations corresponding to the symbols; therefore, desired location information can be obtained from the map screen simply by selecting a displayed symbol” (paragraph [0015]), thus limiting the points for which location information can be obtained while symbols are displayed to the locations where symbols are displayed. Furthermore, as stated in (1)B above, the invention provides a navigation device capable of obtaining desired location information from a map screen without

requiring the user to perform complicated operations. This interpretation is also consistent with the specification's statements that, for that purpose, the device "comprises location-information acquisition means 46 for obtaining location information for a target location by designating a point with a cursor on the map screen" (paragraph [0030]); "is configured so that symbols indicating candidate points remain even when the map is displayed at a large scale at which symbols other than candidate points disappear, thereby improving convenience" (paragraph [0038]); "when setting a waypoint, acquisition of location information is restricted for locations other than those corresponding to symbols, so that an unnecessary point will not be set by mistake even on a large-scale map screen" (paragraph [0040]); and "although location information cannot be obtained for points other than those corresponding to symbols on the map screen, the location-information selection cursor may also be made incapable of moving anywhere other than candidate points (symbols), rather than merely preventing acquisition" (paragraph [0042]).

D. Meaning of the invention of claim 1 after the correction

In contrast, the invention of claim 1 after correction provides that "while the candidate points are displayed as symbols," "the points for which location information of candidate points can be obtained are restricted to locations corresponding to the symbols." As stated in B above, according to the claim language, the candidate points after extraction by the candidate-extraction means are displayed as symbols on the map screen. Therefore, "locations corresponding to the symbols" means the geographical positions on Earth of the candidate points displayed as symbols on the map screen, and this means the same thing as "points for which location information of candidate points can be obtained" on the map screen. Consequently, in claim 1 after correction, no "restriction" whatsoever is imposed on the points for which location information can be obtained.

In addition, as stated in B above, the location-information acquisition means obtains location information for points, not for candidate points. Thus claim 1 after correction leaves unclear whether, while candidate points are displayed as symbols, the location-information acquisition means can obtain location information for points that are arbitrary places displayed on the map screen other than candidate points.

In other words, by adding the words "of candidate points," the invention of claim 1 after correction removes the "restriction" on the "points" for which location information can be obtained and makes the range within which location information can be obtained unclear. It renders meaningless the claim language "while the candidate points are displayed as symbols on the map screen of the display means, restrict the points for which location information can be obtained by the location-information acquisition means to locations corresponding to the symbols" (Element G), and can be said to delete part of the matters defining the invention.

E. Comparison between the invention of claim 1 before correction and the invention of claim 1 after correction

Accordingly, Correction 1 changes the invention of claim 1 from one in which, as stated in claim 1 before correction, the points for which location information can be obtained are limited to locations corresponding to symbols and location information for other points cannot be obtained, to one that removes the "restriction" on the points for which location information can be obtained, makes the range of acquisition of location information unclear, and deletes part of the matters defining the invention. This change alters the scope of the claims; it is not a narrowing change, nor can it be said to have the purpose of "clarifying an ambiguous statement." It clearly causes unforeseen disadvantages to third parties who relied on the wording of claim 1 before correction.

Therefore, Correction 1 is found substantially to change the scope of the claims and must be held not to satisfy the requirements of Article 126(6) of the Patent Act. There is no error in the trial decision's conclusion to the same effect.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-92616.pdf

[Contract / Patent Act Article 73(2)] Tokyo District Court, 2019 (Wa) No. 3141 <Tanaka>

Original Ameblo publication: 2024-02-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12840272429.html

[Contract / Patent Act Article 73(2)] Tokyo District Court, 2019 (Wa) No. 3141 <Tanaka>

The contract stated that the patent right belongs to the plaintiff,

but after the defendant filed the application, the right was jointly owned.

⇒ After the collaboration ended, the claim for transfer of the ownership share was denied.

(Reason) The contract also terminated when the collaboration ended.

* Would it have been better to stipulate that the right “belongs exclusively to the plaintiff”?

IP High Court, 2023 (Gyo-Ke) No. 10059 [Prescription with an Entry for the Quantity Held by the Patient] <Shoji> Matter of human convention ⇒ Not an invention

Original Ameblo publication: 2024-02-12

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12840272565.html

2023 (Gyo-Ke) No. 10059 [Prescription with an Entry for the Quantity Held by the Patient] <Shoji>

* Matter of human convention ⇒ Does not qualify as an invention

(The specification did not mention an “electronic prescription” or a “PC program.”)

(Excerpt from the judgment)

Among the matters in the claimed invention, the items to be entered on a “prescription” are prescribed by Article 21 of the Regulations for Enforcement of the Medical Practitioners’ Act. Thus the entries for “quantity, usage and dosage” are understood as rules based on laws and regulations, that is, human-made arrangements. Accordingly, the “number of days of administration” entered as “quantity, usage and dosage” is also a human-made arrangement. In the claimed invention, providing an entry for the “quantity held by the patient” under the “number of days of administration” on a prescription is likewise merely a human-made arrangement specifying what a physician is to enter on the prescription, and cannot be said to utilize a law of nature. Moreover, the claimed invention specifies methods for calculating … the administration period excluding the amount corresponding to the medicines held by the patient, but each calculation method is a human-made arrangement specifying how a physician calculates the administration period when prescribing and administering medicines to a patient, and cannot be said to utilize a law of nature. … The specification, etc. contains no statement or suggestion whatsoever that the “prescription” is an “electronic prescription,” nor any statement or suggestion whatsoever concerning a “PC program.” Accordingly, the plaintiff’s arguments concerning an “electronic prescription” and a “PC program” are unrelated to the claimed invention. …

[Article] Dwango IP High Court Grand Panel Judgment (Patent, December 2023 issue, Hideki Takaishi)

Extending “provision of a program” to “transfer of tangible goods”

(2) Related trademark cases

(2-1) Online-shop server located outside Japan

(2-2) Export of tangible goods from a foreign country to Japan

(3) Patents … important cases

(4) … Cases in other countries

<Contents>

1. Overview

2. IP High Court (Grand Panel), 2022 (Ne) No. 10046 (later case) (production of a system)

(1) Claims (JP6526304 / patent found infringed in the Grand Panel judgment)

(2) Satisfaction of the claim elements (later case, Grand Panel judgment)

(3) Excerpts from the judgment: territoriality (later case, Grand Panel judgment)

(4) Examination of the Grand Panel judgment

(4-1) Appropriateness of the Grand Panel judgment’s legal standard and its application

(4-2) Twist in the logic of the Grand Panel judgment

3. IP High Court, 2018 (Ne) No. 10077 <Presiding Judge Honda> (earlier case) (provision of a program)

(1) Claims (JP4734471 / patent found infringed in the IP High Court judgment in the earlier case)

(2) Satisfaction of the claim elements (earlier case) (reversed on appeal)

(3) Excerpts from the judgment: territoriality (earlier case)

(4) Further examination of IP High Court, 2018 (Ne) No. 10077 (earlier case): rejection of the normative theory of the infringing actor

4. Comparison of the Grand Panel judgment (later case) and the judgment in the earlier case (a consistent understanding of the judgment in the earlier case (2018 (Ne) No. 10077) and the first-instance judgment in the later case (Tokyo District Court, 2019 (Wa) No. 25152))

5. Earlier case: extending “provision of a program” to “transfer of tangible goods” (patents, trademarks, and other countries)

(1) General discussion

(2) Related trademark cases

(2-1) Cases involving online-shop servers located outside Japan

(2-2) Cases involving the export of tangible goods from a foreign country to Japan

(3) Important patent case ([Method for Producing L-Glutamic Acid] case)

(4) Cases in other countries involving servers located abroad

6. Later case (Grand Panel judgment): infringement involving multiple actors

(1) General discussion (including indirect infringement)

(2) Instrumentality theory (single-actor direct infringement)

(3) Control theory (HOYA case, U.S. AKAMAI remand, CAFC en banc) (single-actor direct infringement)

(4) Joint infringement

(5) Instigation and assistance

[Foreign] Korean Supreme Court, March 31, 2022 (2018Hu10923): Inventive Step of Crystal-Form Inventions

Original Ameblo publication: 2024-02-16

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12840800818.html

[Foreign] Korean Supreme Court, March 31, 2022 (2018Hu10923): Inventive Step of Crystal-Form Inventions

Previously, a remarkable effect or an effect different in nature was required.

⇒ The court held that, in addition to ④ advantageous effects,

① whether crystalline polymorphism was expected,

② motivation to arrive at the particular claimed crystal form, and

③ whether it falls within the scope examined in routine polymorph screening

should be considered in making the determination.

IP High Court, 2022 (Gyo-Ke) No. 10131 [Heat Exchanger Using a Thermally Conductive Knitted Wire Fabric] <Honda>

Original Ameblo publication: 2024-02-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12841202853.html

2022 (Gyo-Ke) No. 10131 [Heat Exchanger Using a Thermally Conductive Knitted Wire Fabric] <Honda>

Elements D and F merely claim effects necessarily produced by configurations A, B and C.

⇒ No inventive step

* For an effect recited in a claim to constitute a matter defining the invention, it must define the invention. Adding an effect necessarily produced by the configuration does not contribute to novelty or inventive step.

(Excerpt from the judgment)

Since a person skilled in the art could easily have conceived of providing the cited invention with configurations A through C of the claimed invention, the cited invention would, as a consequence, naturally also be provided with configurations D and F of the claimed invention. … Configuration D specifies an operation realized by having configurations A through C. Because the “device requiring heat dissipation or heat absorption” in configuration C does not specify what members it includes as physical components, whatever components are contained within the cited invention’s “heat pipe 4 having a heat-generating portion” do not affect the identification of common features and differences between the claimed invention and the cited invention concerning configuration C, or the determination of obviousness, and do not affect the determination concerning configuration D either. … Since configuration F does not specify a basis for comparison, “rapidly conducting the generated heat over the shortest distance to the largest heat-dissipating surface” in configuration F is a function possessed by a device having configurations A through C, and is not an operation specified by comparison with some criterion. …

Osaka District Court, 2020 (Wa) No. 4913 [Electric Impact Tightening Tool] <Takemiya>

Original Ameblo publication: 2024-02-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12841203377.html

Osaka District Court, 2020 (Wa) No. 4913 [Electric Impact Tightening Tool] <Takemiya>

* Cumulative application of paragraphs (2) and (3) denied: competing products were found not to satisfy the claim elements.

“Looking at the competing products … none is found to employ an outer-rotor electric motor … the plaintiff cannot be said to have lost an opportunity to grant a license … with respect to the rebutted portion.”

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-92070.pdf

[Claim 1] … An electric impact tightening tool characterized in that the electric motor … is an outer-rotor electric motor.

(Excerpt from the judgment)

The portion for which the presumption is rebutted on the ground of the existence of competing products in the market is based on the probability that, even if the infringing products had not been sold, competing products other than those of the infringer and the patentee would have been sold. For the portion for which the presumption is rebutted because of the probability of competing products being sold, the plaintiff patentee does not stand in a relationship of granting a license to the defendant; therefore, it cannot be found that the plaintiff could have granted a license to the defendant. Moreover, looking at the competing products in this case, although all have performance and the like similar to the effects of the corrected invention, none is found to employ an outer-rotor electric motor, and they are found to have mechanisms different from the configuration of the corrected invention. From this standpoint as well, the plaintiff cannot be said to have lost an opportunity to grant a license with respect to that rebutted portion. … In this case, paragraph (3) of Article 102 of the Patent Act cannot be applied to the portion for which the presumption under paragraph (2) of that Article is rebutted.

IP High Court, 2005 (Gyo-Ke) No. 10223 [Acidic Oil-in-Water Emulsified Seasoning] <Sato>

Original Ameblo publication: 2024-02-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12841203804.html

2005 (Gyo-Ke) No. 10223 [Acidic Oil-in-Water Emulsified Seasoning] <Sato>

* A case recognizing inventive step in view of an unpredictable synergistic effect

"Using them together … compared with using one of them … produces a synergistic effect … of making oil-phase separation less likely. … Also taking into account that a person skilled in the art could not predict the synergistic effect …" the invention was not obvious.

(Excerpt from the judgment)

Invention 1 is found to produce the effect of making oil-phase separation less likely when subjected to heat treatment in the form of baking or frying, by using phospholipase A-treated egg yolk together with octenyl succinate starch, as compared with using either phospholipase A-treated egg yolk or octenyl succinate starch alone. According to (c) above, it can be inferred that when only one of phospholipase A-treated egg yolk and octenyl succinate starch is used, oil-phase separation occurs and shape retention is lost upon baking even if its content is increased. Accordingly, the above effect of Invention 1 should be recognized as a synergistic effect arising from the combined use of phospholipase A-treated egg yolk and octenyl succinate starch. …

… Also taking into account that the synergistic effect could not be predicted by a person skilled in the art from the disclosures of Publications 1 and 2, it cannot be said that a person skilled in the art could easily have conceived of incorporating octenyl succinate starch in accordance with the teaching of Publication 2, instead of the starch, dextrin or gums that Publication 1 states may be incorporated into the cited invention as necessary. …

[United States] <Federal District Court> Sonos v. Google LLC (N.D. Cal. 2023)

Original Ameblo publication: 2024-02-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12841844322.html

[United States] <Federal District Court> Sonos v. Google LLC (N.D. Cal. Oct. 6, 2023)

Sonos claimed, in a continuation application, an invention that read on Google's products

⇒ The jury awarded $32.5 million

However, the judge held the patent unenforceable, finding it unfair to amend claims after seeing a competing product. (The lengthy period during which the application had been pending also had a major influence.)

⇒ Google restored the functionality

★ If this judgment is upheld by the CAFC, it will likely fundamentally overturn patent divisional-application strategies.

★ The thinking is akin to the Chinese Supreme People's Court's restrictions on the timing of divisional applications.

★ According to a comment I received after posting, Brazil apparently follows the same practice as China.

https://patentlyo.com/patent/2024/02/redefining-continuation-strategy.html

[2026 editorial update] On August 28, 2025, the Federal Circuit reversed the invalidity judgments for lack of written description and the findings of unenforceability for prosecution laches concerning U.S. Patent Nos. 10,469,966 and 10,848,885. It affirmed the obviousness-based invalidity judgment concerning the asserted claims of U.S. Patent No. 10,779,033. The statement above beginning "If this judgment is upheld" reflects the perspective at the time of the 2024 post, not the later appellate outcome.

IP High Court, 2022 (Gyo-Ke) No. 10109 [Anti-Glare Film] <Miyasaka>

Original Ameblo publication: 2024-02-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12841844520.html

2022 (Gyo-Ke) No. 10109 [Anti-Glare Film] <Miyasaka>

1. Clarity requirement satisfied

There is no particular difficulty in taking several photographs to determine the F-number that produces the highest contrast.

Even if the size of the photographic subject varies individually, using the apparatus described in the specification and adjusting it according to the described method naturally determines the shooting distance for each subject.

2. Support requirement satisfied

“By varying the haze value, the clarity of a transmitted image can also be adjusted. … To improve anti-glare performance while suppressing sparkle, it is sufficient not only to reduce the surface irregularities of the anti-glare layer … but also to increase the slope of the irregularities … to make them steeper and increase their number ([0078]).”

3. Enablement requirement satisfied

In response to the defendant’s argument, the court held that “the shape of the irregular structure formed by condensation of fine particles is understood to be similar to the shape of the above droplet-phase structure resulting from the progress of aggregation in spinodal decomposition; therefore, reference can be made to the irregular structure of the first embodiment.”

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-92560.pdf

[Article / Foreign] Antibody Patents in Europe (Chizai Kanri, Vol. 73, No. 6, 2023, Naho Fujimoto)

Original Ameblo publication: 2024-02-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12841968141.html

[Article / Foreign] Antibody Patents in Europe (Chizai Kanri, Vol. 73, No. 6, 2023, Naho Fujimoto)

Inventive step in Europe: effects are important

The question is whether it is credible that the effect is obtained over the full scope.

⇒ If the effect is not recognized, the problem becomes “providing an alternative,” and the invention is regarded as obvious.

Even structural claims face difficulty establishing inventive step merely because their sequences differ.

Amgen’s invention was also found to lack inventive step.

① Disclaimer claims and inventive step: research on "trial decisions"

⇒ The same as court decisions

② Indirect infringement: reassessing systems and methods that do not produce a product!!

The most recent 10 years

Success rate under items (i) and (iv): 83% (30 cases)

* However, some cases were captured under items (ii) and (v)

Success rate under items (ii) and (v): 47% (9 cases)

* Few cases reject the "indispensability requirement"!!

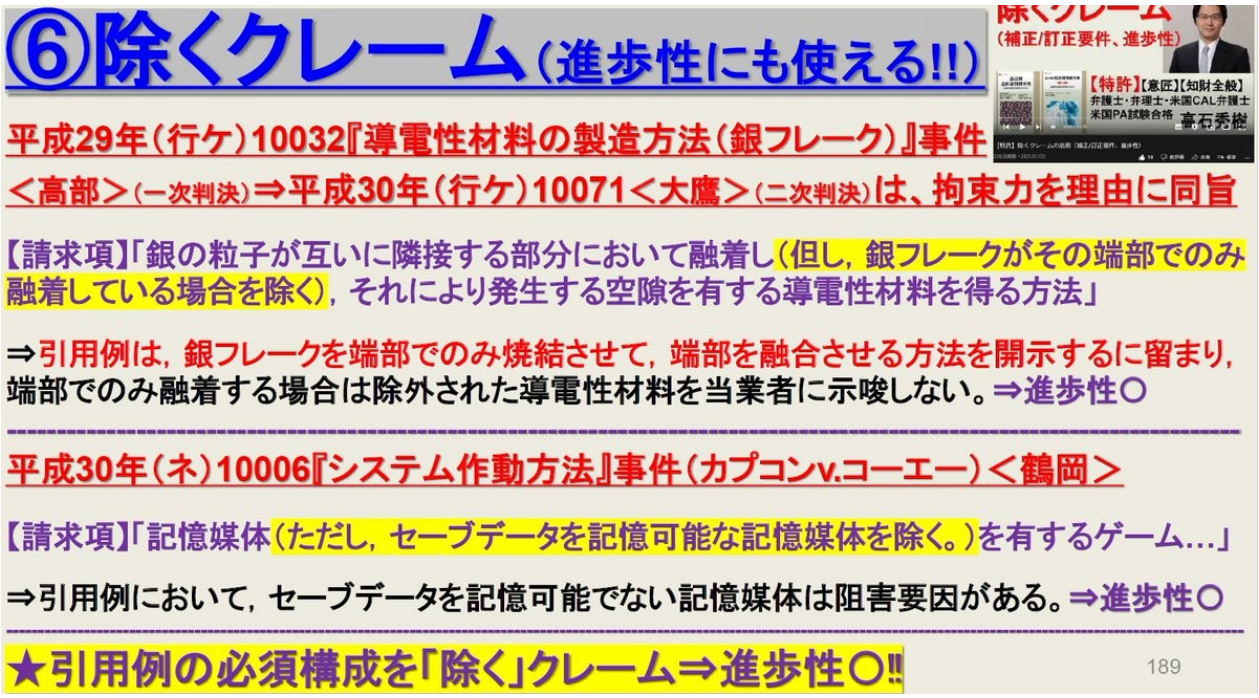
令和３年（行ケ）第10150号＜東海林＞ =令和３年（行ケ）第10151号＜東海林＞	船舶 ＊「除くクレーム」で本件発明の作用効果が変わらない。 ⇒新たな技術的事項の導入に当たらない ⇒訂正要件○ ⇒進歩性も○!!	…「浸水防止部屋」は、タンクの機能を備えることが 許容されるから、「浸水防止部屋」には、タンクの機能を兼ねるものと、タンクの機能を兼ねないものがあるものと認められる。本件明細書等には、浸水防止部屋としてタンクの機能を兼ねるもののみが記載されていると解すべき理由はないから、本件明細書等には、タンクの機能を兼ねる「浸水防止部屋」とともに、タンクの機能を兼ねない「浸水防止部屋」が記載されていると認められる。そして、タンクの機能を兼ねる「浸水防止部屋」を備える発明と、タンクの機能を兼ねない「浸水防止部屋」を備える発明は、いずれも本件明細書等に記載された発明であったから、…特許請求の範囲の請求項１の「浸水防止部屋」がタンクの機能を兼ねない「浸水防止部屋（ただし、タンクを除く。）」に訂正されて、タンクの機能を兼ねる「浸水防止部屋」を備える発明が除かれても、新たな技術的事項を導入しないことは明らかである。なお、本件訂正により、本件訂正後の発明が、側壁における隔壁の近傍が損傷を受けても、浸水防止部屋が浸水するだけで、複数の部屋に跨って浸水することはなく、船損傷時における複数の部屋への浸水を防止することができると共に、複数の部屋の大型化を抑制して設計の自由度を拡大することができるという本件発明の効果を奏することなく、新たな効果を奏する発明となると解すべき理由はない。そのため、本件訂正によって発明の作用効果が変わることによって新たな技術的事項が導入されたと解する余地もない。	勝有★
令和４年（行ケ）第10030号＜菅野＞	ポリエステル樹脂組成物の積層体 ＊「除くクレーム」は発明の課題に影響が及ばなければ、新たな技術的事項の導入に当たらない。 ⇒訂正要件○（訂正後の進歩性判断せず）	…被告は、本件訂正事項２のような「除くクレーム」とする訂正は、第三者に明細書等の記載に関して誤解を与える可能性があり、不測の不利益を及ぼす蓋然性が高いものというべきである旨主張する。しかし、被告主張のような懸念が仮にあったとしても、それは、訂正後の請求項につき、明確性要件やサポート要件等の適合性を巡って検討されるべき問題というべきであるから、いずれにしても、本件事案において、この点をもって直ちに訂正を認めない理由とすることは相当でない。… …訂正…によって「該積層体上に無機酸化物の蒸着膜が設けられ、その蒸着膜上にガスバリア性塗布膜が設けられてなるもの」を除外することにより、新たな技術的事項が導入されるわけではなく、新規事項が追加されるものではない。本件発明の課題は、バイオマスエチレングリコールを用いたカーボンニュートラルなポリエステルを含む樹脂組成物からなる層を有する積層体を提供することであって、従来の化石燃料から得られる原料から製造された積層体と機械的特性等の物性面で遜色ないポリエステル樹脂フィルムの積層体を提供すること（【０００８】）であるが、上記除外によってこの技術的課題に何らかの影響が及ぶものではない。	勝有○
令和４年（行ケ）第10125号＜清水響＞	２，３－ジクロロ－１，１，１－トリフルオロプロパン，２－クロロ－１，１，１－トリフルオロプロペン，２－クロロ－１，１，１，２－テトラフルオロプロパンまたは２，３，３，３－テトラフルオロプロペンを含む組成物 ＊先行技術と同一である部分のみを除くことは訂正要件ではない。 ＊進歩性欠如の先行技術と実質的に同一と評価される蓋然性がある部分を除いたと認定した。⇒影響あり?	…特許請求の範囲を訂正するときは、…先願発明と同一である部分のみを除外することや、当該特許出願前に公知であった先行技術と同一である部分のみを除外することは要件とされていない。そして、訂正が、「明細書、特許請求の範囲又は図面に記載した事項の範囲内において」行われた場合、すなわち、当初技術的事項との関係において、新たな技術的事項を導入しないものであるときは、当該訂正によって第三者に不測の損害をおよぼすとは考え難いから、同項に規定する訂正要件の解釈として、被告が主張するような要件を加重することは相当ではないというべきである。 また、被告は、除くクレームの形式で自由に訂正発明の内容を規定することは許されない旨主張しているところ、本件訂正は…甲４による新規性欠如及び進歩性欠如の無効理由がある旨の審決の予告を受けてされた訂正であるが、…甲４には…「ＨＣＦＣ－２２５ｃｂを含むハロカーボン混合物から…ヒドロフルオロカーボンを直接的に調製する有利な方法に関する。…この方法は相当量の該ＨＣＦＣ－２２５ｃｂを他の化合物へ転化することなく行われる。」（【００１２】）、「本発明による好ましい混合物とは、化合物ＨＣＦＣ－２２５ｃｂを含む混合物である。他の好ましい態様において、混合物は本質的に約１～約９９重量パーセントのＨＣＦＣ－２２５ｃｂ…とから成る」（【００１５】）との記載があり、同各記載を踏まえると、本件訂正は、甲４に記載された発明と実質的に同一であると評価される蓋然性がある部分を除外しようとするものといえるから、本件訂正は先行技術である甲４に記載された発明とは無関係に、自由に訂正発明の内容を規定するものとはいえない。	勝有△

English translation of the case table

2021 (Gyo-Ke) Nos. 10150 and 10151 <Shoji>. Ship. The operation and effects of the invention do not change through a disclaimer. ⇒ No introduction of new technical matter. ⇒ Correction requirements satisfied. ⇒ Inventive step also affirmed!! Outcome: wins ★.

…An "anti-flooding compartment" is permitted to have a tank function; therefore, "anti-flooding compartments" are understood to include those that also have a tank function and those that do not. There is no reason to understand the specification and other documents as describing only those anti-flooding compartments that also

have a tank function. The specification and other documents are therefore found to describe both anti-flooding compartments that also have a tank function and anti-flooding compartments that do not. Thus, an invention having an anti-flooding compartment that also has a tank function and an invention having one that does not are both inventions described in the specification and other documents. …Even if the anti-flooding compartment in claim 1 is amended to read "an anti-flooding compartment that does not also have a tank function (excluding a tank)" and inventions having an anti-flooding compartment that also has a tank function are excluded, it is clear that no new technical matter is introduced. Moreover, there is no reason to understand the corrected invention as a different invention producing a new effect instead of the effects of the invention in question: even if an adjacent partition wall is damaged, only the anti-flooding compartment is flooded, without flooding across multiple compartments; flooding of multiple compartments when the ship is damaged can be prevented; and an increase in the size of multiple compartments can be restrained, increasing freedom of design. Accordingly, there is no room to understand the correction as introducing new technical matter through a change in the operation or effects of the invention.



2022 (Gyo-Ke) No. 10030 <Kanno>. Laminate of a polyester resin composition. Unless a disclaimer affects the problem addressed by the invention, it does not introduce new technical matter. ⇒ Correction requirements satisfied (the inventive step of the corrected invention is also affirmed). Outcome: wins ○.

…The defendant argues that a correction employing a disclaimer, such as correction item 2, should be recognized only where there is a high likelihood of causing third parties to misunderstand the description in the specification and other documents or of causing unexpected disadvantage. However, even assuming a concept of the kind asserted by the defendant, it is a matter to be considered through the clarity and support requirements for the corrected claims. In any event, it cannot be a reason for refusing the correction in this case merely on that ground. …By excluding through the correction "a laminate in which an inorganic-oxide deposited film is provided on the laminate and a gas-barrier coating film is provided on that deposited film," new technical matter is not introduced; nor is any new matter added. The problem of the invention is to provide a laminate having a layer made of a resin composition containing a polyester having a furandicarboxylic acid component as a main acid component, in which the mechanical properties and other physical properties of the laminate manufactured from raw materials obtainable from later biomass raw materials are suitable for a polyester resin film laminate, compared with a laminate manufactured from raw materials obtainable from conventional fossil raw materials ([0008]). The foregoing exclusion has no influence on this technical problem.

2022 (Gyo-Ke) No. 10125 <Shimizu>. Composition comprising 2,3-dichloro-1,1,1-trifluoropropane; 2-chloro-1,1,1-trifluoropropene; 2-chloro-1,1,1,2-tetrafluoropropane; or 2,3,3,3-tetrafluoropropene. Exclusion only of a portion identical to the prior art is not a correction requirement. A portion having a high likelihood of being evaluated as substantially identical to the prior art relied on for lack of inventive step was excluded. ← Influence? Outcome: wins ★.

…Correction of the claims … is not subject to a requirement that only a portion identical to the prior invention, or only a portion identical to prior art publicly known before the patent application, be excluded. Furthermore, where a correction is made within the matters described in the specification, claims, or drawings, so long as it introduces no new technical matter in relation to the technical matters in question, it is difficult to consider that the correction causes unexpected disadvantage to third parties. It is therefore inappropriate to impose additional requirements of the kind asserted by the defendant as an interpretation of the correction requirements prescribed by that provision. …The defendant also argues that it is impermissible to specify the content of the corrected invention freely in the form of a disclaimer. However, the correction was made following a preliminary trial decision finding grounds of invalidity for lack of novelty and inventive step based on Exhibit Ko 4. …Exhibit Ko 4 states … "a method useful for preparing heptafluoropropane directly from a chlorofluorocarbon mixture containing HCFC-225cb. …This method is performed without converting a considerable amount of HCFC-225cb into other compounds." ([0012]), and "a preferred mixture according to the invention is a mixture containing the compound HCFC-225cb. In another preferred embodiment, the mixture consists essentially of about 1 to about 99 weight percent HCFC-225cb…" ([0015]). In light of those statements, the correction seeks to exclude a portion having a high likelihood of being evaluated as substantially identical to the invention described

in Exhibit Ko 4. The correction is therefore not an attempt to specify freely the content of the corrected invention without relation to the invention described in Exhibit Ko 4 as prior art.

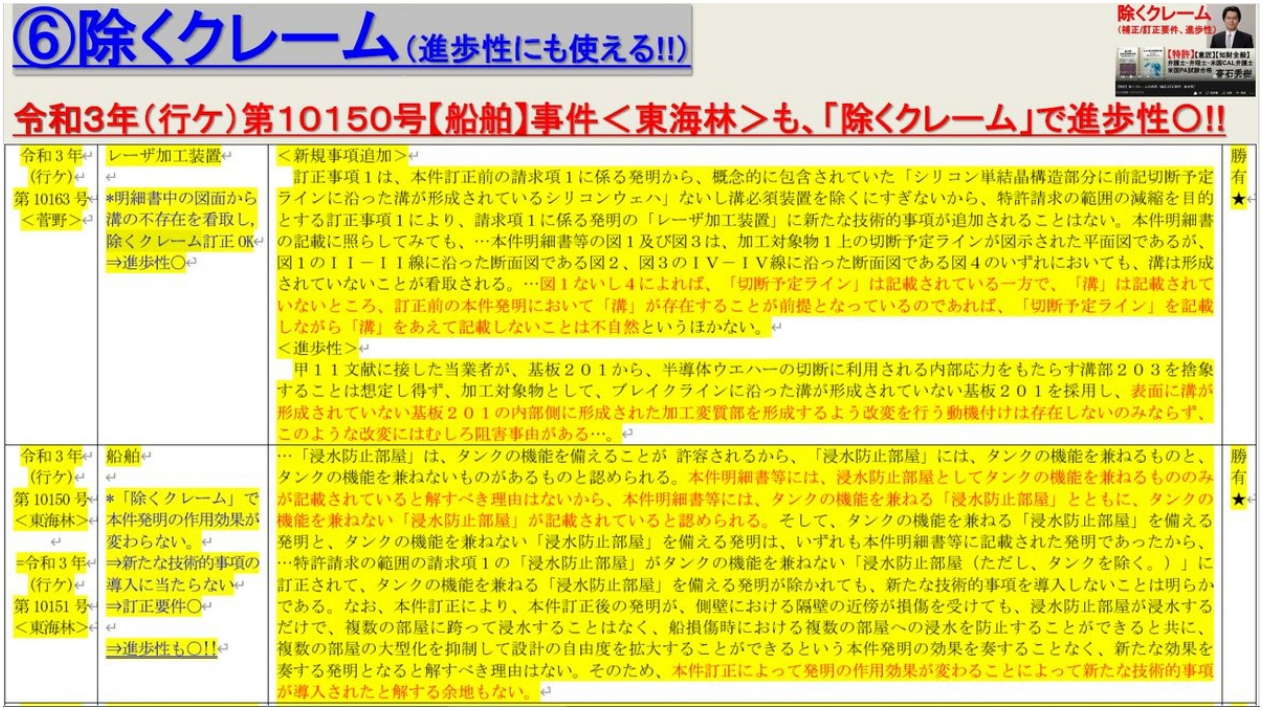
6. Disclaimers (usable for inventive step as well!!)

2017 (Gyo-Ke) No. 10032, [Method of Manufacturing an Electrically Conductive Material (Silver Flakes)] <Takabe> (first judgment) ⇒ 2018 (Gyo-Ke) No. 10071 <Otaka> (second judgment) reached the same result on the ground of the binding effect.

[Claim] “A method of obtaining an electrically conductive material having voids produced by silver particles being fused at portions adjacent to each other (excluding the case in which the silver flakes are fused only at their end portions).”

⇒ The cited reference merely discloses a method of sintering silver flakes only at their end portions and fusing the end portions; it does not suggest to a person skilled in the art an electrically conductive material from which cases of fusion only at the end portions are excluded. ⇒ Inventive step affirmed.



2018 (Ne) No. 10006, [System Operation Method] (Capcom v. Koei) <Tsuruoka>.

[Claim] “A game having a storage medium (excluding a storage medium capable of storing save data)…”

⇒ In the cited reference, there is a factor discouraging a storage medium incapable of storing save data. ⇒ Inventive step affirmed.

★ A disclaimer excluding an essential configuration of the cited reference ⇒ Inventive step affirmed!!

Inset: Disclaimers (amendment/correction requirements; inventive step). Patents [Designs] [Intellectual property generally]. Attorney-at-law, Patent Attorney; former CAFC law clerk; former USPTO examination training participant. Hideki Takaishi.

English translation of the additional disclaimer slide

6. Disclaimers (usable for inventive step as well!!)

2021 (Gyo-Ke) No. 10150, [Ship] <Shoji>, also: inventive step affirmed through a disclaimer!!

2021 (Gyo-Ke) No. 10163 <Shimizu>. Laser Processing Apparatus. Absence of a groove is read from the drawings in the specification, and correction by disclaimer is accepted. ⇒ Inventive step affirmed. Outcome: wins ★.

<Addition of new matter> Correction item 1 merely excludes from the invention of claim 1 before correction, to reduce the scope of the claim, a silicon wafer having grooves formed along scheduled cutting lines in a silicon single-crystal structure portion, or an apparatus requiring grooves, which had conceptually been included. The correction therefore introduces no new technical matter into the “laser processing apparatus” of claim 1. In light of the description in the specification and other documents, … Figures 1 and 3 are plan views showing scheduled cutting lines on workpiece 1. In Figure 2, a sectional view taken along line II–II in Figure 1, and Figure 4, a sectional view taken along line IV–IV in Figure 3, the absence of a groove can be read. …According to Figures 1 through 4, “scheduled cutting lines” are described, while “grooves” are not. If the existence of “grooves” had been assumed in the invention before correction, it would be rather unnatural to describe “scheduled cutting lines” without also describing “grooves.”

<Inventive step> A person skilled in the art encountering Exhibit Ko 11 could not conceive of removing groove portion 203, which relieves internal stress used to cut a semiconductor wafer, from substrate 201. There is not only no motivation to adopt, as the workpiece, a substrate 201 without a groove along the break line and modify it to form a modified processing layer inside substrate 201 whose surface has no groove, but also a clear factor discouraging such a modification.

2021 (Gyo-Ke) Nos. 10150 and 10151 <Shoji>. Ship. The operation and effects of the invention do not change through a disclaimer. ⇒ No introduction of new technical matter. ⇒ Correction requirements satisfied. ⇒ Inventive step also affirmed!! Outcome: wins ★.

…An “anti-flooding compartment” is permitted to have a tank function; therefore, “anti-flooding compartments” are understood to include those that also have a tank function and those that do not. There is no reason to understand the specification and other documents as describing only those anti-flooding compartments that also have a tank function. The specification and other documents are therefore found to describe both anti-flooding compartments that also have a tank function and anti-flooding compartments that do not. Thus, an invention having an anti-flooding compartment that also has a tank function and an invention having one that does not are

both inventions described in the specification and other documents. …Even if the anti-flooding compartment in claim 1 is amended to read “an anti-flooding compartment that does not also have a tank function (excluding a tank)” and inventions having an anti-flooding compartment that also has a tank function are excluded, it is clear that no new technical matter is introduced. Moreover, there is no reason to understand the corrected invention as a different invention producing a new effect instead of the effects of the invention in question: even if an adjacent partition wall is damaged, only the anti-flooding compartment is flooded, without flooding across multiple compartments; flooding of multiple compartments when the ship is damaged can be prevented; and an increase in the size of multiple compartments can be restrained, increasing freedom of design. Accordingly, there is no room to understand the correction as introducing new technical matter through a change in the operation or effects of the invention.

Inset: Disclaimers (amendment/correction requirements; inventive step). Patents [Designs] [Intellectual property generally]. Attorney-at-law, Patent Attorney; former CAFC law clerk; former USPTO examination training participant. Hideki Takaishi.

(Editor's transcription and correction of the figure above)

⑥ Disclaimer claims (also useful in the inventive-step analysis)

2021 (Gyo-Ke) No. 10150, “Vessel” (Presiding Judge Shoji), also upheld inventive step for a claim containing a disclaimer.

Case	Summary and translated excerpts
2021 (Gyo-Ke) No. 10111 Laser Processing Apparatus Presiding Judge Kanno Favorable ★	The drawings disclosed the absence of grooves, supporting correction by a disclaimer. Inventive step was also upheld. [Addition of new matter — translation of excerpts] “Correction 1 merely excludes a ‘silicon wafer having grooves along the planned cutting lines in the silicon single-crystal structure portion,’ or an apparatus requiring grooves, that was conceptually encompassed by the invention of Claim 1 before correction. Consequently, Correction 1, which restricts the scope of the claims, adds no new technical matter to the ‘laser processing apparatus’ of Claim 1. … Figures 1 and 3 in the specification and other documents are plan views showing planned cutting lines on workpiece 1. Both Figure 2, a cross section along line II–II in Figure 1, and Figure 4, a cross section along line IV–IV in Figure 3, show that no grooves are present. … Figures 1–4 depict ‘planned cutting lines’ but do not depict ‘grooves.’ If the invention before correction had presupposed the existence of grooves, it would be unnatural deliberately to omit grooves while depicting the planned cutting lines.” [Inventive step — translation of excerpt] “It is inconceivable that a person skilled in the art encountering Document Ko 11 would disregard groove portions 203 in substrate 201, which create the internal stress used to cut the semiconductor wafer. There is not only no motivation to make a modification in which substrate 201 without grooves along the break line is adopted as the workpiece and a processing-altered portion is formed inside that substrate, whose surface has no grooves; rather, there is an inhibiting factor against such a modification….”
2021 (Gyo-Ke) Nos. 10150 and 10151 Vessel Presiding Judge Shoji Favorable ★	The disclaimer did not change the invention’s operation or effects or introduce new technical matter. The correction requirements were satisfied and inventive step was upheld. [New matter and effects — translation of excerpts from No. 10151] “…Because a ‘flood-prevention room’ is permitted to have a tank function, such rooms are found to include both those that also function as tanks and those that do not. There is no reason to interpret the specification and other documents as describing only flood-prevention rooms that also function as tanks. Accordingly, the specification and other documents are found to describe both ‘flood-prevention rooms’ that also function as tanks and ‘flood-prevention rooms’ that do not. Both an invention having a ‘flood-prevention room’ that also functions as a tank and an invention having a ‘flood-prevention room’ that does not were disclosed in the specification and other documents. Therefore, even if Correction 1 amends the ‘flood-prevention room’ in Claim 1 to a ‘flood-prevention room (excluding tanks)’ that does not also function as a tank, thereby excluding the invention having a ‘flood-prevention room’ that also functions as a tank, it is clear that no new technical matter is introduced. Moreover, there is no reason to interpret the correction as resulting in an invention that

Case	Summary and translated excerpts
	achieves a new effect without achieving the effects of the invention in this case: even if the sidewall near a bulkhead is damaged, only the flood-prevention room is flooded and flooding does not extend across multiple rooms, thereby preventing flooding of multiple rooms when the vessel is damaged, while also increasing freedom of design by limiting the enlargement of multiple rooms. Consequently, there is no basis for interpreting the correction as introducing new technical matter through a change in the invention’s operation or effects.”

IP High Court, 2022 (Ne) No. 10008 [Information Provision Device] <Otaka>

2022 (Ne) No. 10008 [Information Provision Device] <Otaka>

* A “patentee’s correction-based rejoinder to an invalidity defense” was asserted in the appeal after the conclusion of written preparatory proceedings. ⇒ Dismissed as untimely

Given the chronology in which the original judgment finding a lack of novelty followed a trial decision maintaining the patent, a correction-based rejoinder to an invalidity defense should have been asserted in the alternative for claim 1 or 5.

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91603.pdf

IP High Court, 2022 (Ne) No. 10078 [Display Device Supportable with One Hand] <Kanno>

Original Ameblo publication: 2024-02-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12842365112.html

2022 (Ne) No. 10078 [Display Device Supportable with One Hand] <Kanno>

* In the court below, the patentee asserted correction-based rejoinders to invalidity defenses based on the second and third corrections.

⇒ It asserted a correction-based rejoinder to an invalidity defense based on the fourth correction "in the statement of reasons for appeal," but the court stated that, in light of the course of proceedings, it should ordinarily be dismissed as untimely.

(However, the court ruled on it because a rebuttal had been submitted.)

(Excerpt from the judgment)

Examining the course of proceedings in the court below, in response to the invalidity defense asserting that the patent lacked novelty and inventive step (Defendant's First Preparatory Brief), raised at the first preparatory-proceedings date (November 18, 2019), the appellant submitted Plaintiff's Second Preparatory Brief concerning a rejoinder based on the second correction by the third preparatory-proceedings date (July 27, 2020). In conjunction with the request for correction in the patent invalidation trial, it then submitted Plaintiff's Fifth Preparatory Brief dated March 3, 2021, and Plaintiff's Sixth Preparatory Brief dated May 27 of that year, setting out a rejoinder based on the third correction. (These briefs, including correction documents, were presented at the fourth preparatory-proceedings date (December 16, 2021).) The original judgment held that neither the rejoinder based on the second correction nor that based on the third correction satisfied the correction requirements and that the patent should be invalidated in a patent invalidation trial. The appellant then added an assertion of a rejoinder based on the fourth correction in its statement of reasons for appeal. In view of this course of proceedings in the court below, the fourth correction constitutes an untimely submitted means of attack or defense, and the appellant was grossly negligent in submitting it late, so dismissal would ordinarily be unavoidable. However, the appellee has submitted rebuttal arguments concerning the rejoinder based on the fourth correction, including that the fourth correction does not satisfy the correction requirements. To this extent, it cannot be said that this would delay the conclusion of the litigation, so the court will examine it below.

Related case: Intellectual Property High Court, 2021 (Gyo-Ke) No. 10037, [Display Device Capable of Being Supported with One Hand]
Judgment date: February 2, 2022
The following is an excerpt from the court's reasoning on the admissibility of the correction in that action seeking revocation of a trial decision.

… It is clear that the intermediate left-right open-position fixing means in configuration e, which "fixes" two display panels "with a stopper" at any angle within a range of approximately 120 degrees to approximately 170 degrees, is a means for "temporary fixation," whereas the arbitrary-angle holding means in configuration C, which "holds" the two display panels "by frictional force," is a means for "semi-fixation." It can naturally be understood that these are separate means employing different fixing means. … There is no basis for narrowly interpreting "an arbitrary angle" in relation to the arbitrary-angle holding means as meaning an angle within the range of approximately 120 degrees to approximately 170 degrees

…; in accordance with its ordinary meaning, it should be understood to include the range from 0 degrees to 360 degrees. … Such a configuration is not described in the specification before correction. …

IP High Court, 2021 (Ne) No. 10094 [… Work Gloves] <Kanno>

Original Ameblo publication: 2024-02-29

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12842496801.html

2021 (Ne) No. 10094 [… Work Gloves] <Kanno>

* In the court below, the patentee asserted a “correction-based rejoinder to an invalidity defense” after the court disclosed its provisional view that the patent was invalid; it was dismissed as untimely.

⇒ “In the statement of reasons for appeal,” it asserted the “correction-based rejoinder to an invalidity defense” dismissed below, but it was again dismissed as untimely.

Cf. The exact opposite of 2016 (Ne) No. 10100 <Takabe>!!

★ There is still no judgment dismissing as untimely a “new” argument raised on appeal “in the statement of reasons for appeal”!!

(Excerpt from the judgment)

In its statement of reasons for appeal, the appellant asserted that it would correct the invention (a correction-based rejoinder to an invalidity defense), but this court dismissed that argument as an untimely means of attack or defense. The reason is that, according to the case record, this rejoinder based on correction was raised after the court below disclosed its provisional view that the patent was invalid and was therefore dismissed below as an untimely means of attack or defense. No circumstances can be found that prevented its being raised at an appropriate time in the court below. Accordingly, the above argument in this appeal is clearly untimely, the appellant was at least grossly negligent in this respect, and permitting this means of attack or defense would clearly delay the conclusion of this litigation considerably.

[United States] Ironburg v. Valve (CAFC, April 3, 2023)

Original Ameblo publication: 2024-03-21

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12845216529.html

[United States] Ironburg v. Valve (CAFC, April 3, 2023)

For IPR estoppel—which, after a final written decision in an IPR, bars assertion in court or the ITC of invalidity grounds raised or reasonably available in that IPR—the test is whether a skilled searcher exercising reasonable diligence could reasonably have been expected to discover the grounds. The patent owner asserting estoppel bears the burden of proof.

+ Invalidity grounds on which review was not instituted became subject to IPR estoppel.

⇒ Invalidity arguments based on grounds included in the petition but not instituted were barred. For grounds not included in the petition and discovered later, however, the estoppel ruling was vacated and remanded because the district court had incorrectly placed the burden of proof on the patent challenger.

[Cases & Trends] Latest U.S. CAFC Decision: Standard and Burden of Proof in Applying IPR Estoppel | NGB Corporation

IP High Court, 2017 (Ne) No. 10043 [Electronic Program Guide with Digital Storage] <Mori> ⇛ No Indirect Infringement

Original Ameblo publication: 2024-03-25

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12845724255.html

2017 (Ne) No. 10043 [Electronic Program Guide with Digital Storage] <Mori>

⇒ No indirect infringement

* “Indispensability” requirement not satisfied

“The distinctive technical means not found in the prior art lies in the interactive television program guide system incorporating … a digital storage device. … The accused products … do not incorporate one. …”

(Excerpt from the judgment)

The invention is intended to provide an interactive television program guide system with a digital storage device in order to offer users advanced functions unavailable with a stand-alone analog storage device. The distinctive technical means not found in the prior art should be understood to lie in the interactive television program guide system having, that is, incorporating, a digital storage device. Accordingly, because the accused products do not incorporate a digital storage device, they cannot be said to be “indispensable for solving the problem” by means of the invention.

* “Article used for production” requirement not satisfied

“… Recording becomes possible only by connecting an external USB hard disk… to the accused products, so there is no room to incorporate digital storage into the accused products. …”

(Excerpt from the judgment)

The accused liquid-crystal television products merely receive broadcasts and none itself has a memory portion (digital storage) capable of recording. Recording destinations are external USB hard disks or Toshiba recorders compatible with REGZA Link; only by connecting these to the accused products can programs received by the accused products be recorded onto the above hard disks or the like. Accordingly, there is no room to incorporate digital storage into the accused products. Thus the accused products cannot be called “articles used for production” of an interactive television guide system having user television equipment that includes a digital storage device.

Tokyo District Court, 2016 (Wa) No. 37954 [Electronic Program Guide with Digital Storage] <Okinaka>

Original Ameblo publication: 2024-03-27

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12846010046.html

Tokyo District Court, 2016 (Wa) No. 37954 [Electronic Program Guide with Digital Storage] <Okinaka>

Estoppel in interpretation of the wording!

= Tokyo District Court, 2012 (Wa) No. 16103 <Hasegawa>

To argue inventive step, the applicant asserted a temporal sequence in which, unlike the cited reference, “a program is stored before program data is stored.”

[Claim 1] (Element D) A system comprising means for digitally storing a plurality of program data in the digital storage device (31), using the interactive television program guide, in response to the digital storage of the plurality of programs, each of the plurality of program data being associated with one of the plurality of programs, and … .

(Excerpt from the judgment)

United, the applicant for the patent, argued to the JPO during prosecution that, in the invention, unlike the invention described in “Cited Reference 3” …, “a program is stored before program data is stored,” for the purpose of showing that the invention differed from the invention in that reference and possessed inventive step. The JPO is understood to have granted the patent on the basis that the invention differed from the invention in “Cited Reference 3” and was not obvious from it, taking United’s above arguments into account as well. Accordingly, the temporal sequence between storage of programs and storage of program data in Element D of the invention should be interpreted, in accordance with United’s above argument, as “a program is stored before program data is stored.” The plaintiff, which succeeded to the position of the patent applicant, is not permitted to make an argument in this litigation inconsistent with the above argument of the patent applicant, as doing so would violate the principle of estoppel. … Since the accused products are not found to have the temporal sequence in which “a program is stored (recorded) before program data is stored,” they do not satisfy Element D.

Tokyo District Court, 2020 (Wa) No. 27972 [Lighting Device] <Shibata>

Original Ameblo publication: 2024-03-28

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12846102586.html

Tokyo District Court, 2020 (Wa) No. 27972 [Lighting Device] <Shibata>

* The extent of each lens portion cannot be identified

⇒ Claim elements not satisfied

(Excerpt from the judgment)

According to the claims and specification, the diffusion lens of each invention has multiple lens portions, each with an identifiable position and shape, and it is possible to ascertain, for each lens portion, the radius of curvature in the direction in which the LEDs are arranged side by side and the radius of curvature in the direction perpendicular to that direction.

The claims and specification also establish that each invention has the technical significance of producing the effects described in 1(2) above for an invention having such lens portions in a diffusion lens. … Given the shapes of the LSDs used in the accused products, the extent of each “lens portion” referred to in “multiple lens portions” and “each lens portion” … of the inventions cannot be identified in any accused product. Thus the accused products cannot be said to have “each lens portion” as referred to in the inventions, and the radius of curvature in the direction in which the LEDs are arranged side by side and that in the perpendicular direction cannot be ascertained for each lens portion. Nor can the accused products be said to satisfy the configurations … concerning the radii of curvature of the inventions.

IP High Court, 2021 (Gyo-Ke) No. 10082 [Electrically Insulated Cable] <Shoji>

Original Ameblo publication: 2024-03-30

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12846335663.html

2021 (Gyo-Ke) No. 10082 [Electrically Insulated Cable] <Shoji>

* Although the problem is common, the cited invention has already solved it by other means.

⇒ No motivation to further combine a secondary reference

= 2007 (Gyo-Ke) No. 10238

= 2012 (Gyo-Ke) No. 10328

= 2016 (Gyo-Ke) No. 10103

= 2017 (Gyo-Ke) No. 10013

"In the cited invention … the problem common to the claimed invention has already been solved by means different from those of the claimed invention … there is no need … to wrap both wire cores with a tape member, thereby placing the tape member between both wire cores and the sheath. …"

(Excerpt from the judgment)

The claimed invention concerns the ease of removing a coating layer to expose a core wire. Conventional cables with powder applied to the outer peripheral surface of the core material had the problem that the powder scattered into the surroundings when the core material was removed, reducing workability. The invention has technical significance in seeking to solve this problem by providing, between the core wire and coating layer, a tape member arranged in a state wrapped around the core wire, thereby allowing the core wire and coating layer to be separated easily by removing the tape member. On the other hand, … one of the problems addressed by the cited invention is facilitating removal of the wire cores, and in that respect it shares a problem with the claimed invention. However, it seeks to solve that problem by a configuration in which only the outer peripheries of the power-supply and signal wire cores are covered with a sheath, so its means for solving the problem differ from those of the claimed invention. In this way, the cited invention has already solved the problem common to the claimed invention by different means. It must therefore be said that there is no need, in addition to those problem-solving means, to wrap both wire cores with a tape member, thereby placing the tape member between the wire cores and the sheath. If such a configuration were added to the cited invention, removing the wire cores would require not merely removing the sheath but also removing the tape member, which would instead impair workability and detract from the effects of the cited invention. Moreover, Publication Ko 1 contains no statement suggesting any technical significance in wrapping both wire cores with a tape member even at the expense of the effects of the cited invention.

★ On this issue,

Cases favorable to patentees include:

• 2016 (Gyo-Ke) No. 10103 <Takabe>, Wire Gripper

• 2021 (Gyo-Ke) No. 10082 <Shoji>, Electrically Insulated Cable

• 2022 (Gyo-Ke) No. 10003 <Kanno>, Method for Preventing Adhesion of Marine Organisms

Cases unfavorable to patentees include:

• 2010 (Gyo-Ke) No. 10328 <Takizawa>, Safety Shield Assembly

* Combining multiple means for similar purposes and providing them redundantly was held obvious

• 2015 (Gyo-Ke) No. 10114 <Takabe>, Tire

* A person skilled in the art would also try other solutions in order to solve the primary reference’s problem completely

• 2016 (Gyo-Ke) No. 10039 <Shimizu>, Medical Multi-Chamber Container

* Even if a secondary reference solves the cited invention’s problem, the motivation to solve it by another method is not lost

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-91207.pdf

Osaka District Court, 2021 (Wa) No. 10032 [Chip-Type Fuse] <Takemiya>

Original Ameblo publication: 2024-04-01

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12846653463.html

Osaka District Court, 2021 (Wa) No. 10032 [Chip-Type Fuse] <Takemiya>

* The case became a battle of experiments, and identical function and effect were not established.

⇒ Second requirement of the doctrine of equivalents not satisfied

The experiments did not themselves compare the respective functions and effects of the accused product's "sealed space" and the invention's "arc-extinguishing material portion" …; their results contradicted the defendant's … test report … .

* The court also stated the general proposition that equivalence can be established even when part of a claim element is missing. (★ In Tokyo District Court, 2012 (Wa) No. 31523 <Hasegawa>, equivalence was found for Product A, which lacked part of a claim element!!)

(Excerpt from the judgment)

The plaintiff submits as evidence experimental reports, etc. … to show that the "sealed space 26 formed by bonding with adhesive" in configuration c of the accused product has the same function and effect (arc extinguishing) as the "arc-extinguishing material portion" in Element C of the invention. These reports compare the duration of arc discharges in products having the same structure as the accused product when the fuse-element portion has a sealed structure, when it has an unsealed structure, or when a terminal-integrated fuse element is removed and mounted on a board for interruption testing. The results indicate that the duration in the sealed structure was one-half to one-third that in the unsealed structure or the like. However, these experiments do not themselves compare the respective functions and effects of the accused product's "sealed space" and the invention's "arc-extinguishing material portion." In addition, according to the test report … submitted as evidence by the defendant, the durations of arc discharges were recorded for the accused product, a fuse comprising the accused product with an arc-extinguishing material portion added, and the fuse element of the accused product alone, and the accused product had the longest duration. With respect to the respective arc-discharge durations of the accused product and the fuse element, these results contradict the experimental reports … submitted by the plaintiff. Accordingly, the above evidence submitted by the plaintiff and other circumstances do not sufficiently establish that configuration c of the accused product has the same function and effect as Element C of the invention. At least the second requirement therefore cannot be said to be satisfied.

Even where the product or other subject matter lacks part of a claim element of the patented invention, infringement under the doctrine of equivalents is understood to be possible if that part is not an essential part of the patented invention and the other requirements for equivalence described above are met. In response, the defendant argues that applying the doctrine of equivalents where part of a claim element is missing impermissibly asserts an enlargement of the claims. However, there is no reasonable basis for distinguishing a case in which part of a claim element is replaced with another configuration from one in which part of a claim element is missing. …

https://www.courts.go.jp/assets/hanrei/hanrei-pdf-92171.pdf

IP High Court, 2023 (Ne) No. 10041 [Training Equipment] <Hibiku Shimizu>

Original Ameblo publication: 2024-04-02

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12846760261.html

2023 (Ne) No. 10041 [Training Equipment] <Hibiku Shimizu>

The court rejected the identification of the bar alone, extracted from the apparatus described in Exhibit Ko 7, as an independent cited invention, and also denied that removal of the weight-supporting portion would have been obvious.

"… Bar 10 alone … cannot be identified as an independent cited invention; the cited invention … includes not only bar 10 but also the weight-supporting portion … in determining inventive step … the question is whether removing the weight-supporting portion would have been obvious."

(Excerpt from the judgment)

… In this case, bar 10 alone (the Ko 7 invention) cannot be identified as an independent cited invention. Rather, it is appropriate to identify the Ko 7 invention (defendant), which comprises not only bar 10 but also the weight-supporting portion, as the cited invention. Therefore, in determining the inventive step of the inventions using the invention described in Publication Ko 7 as the cited invention …, the question is whether it would have been obvious to remove the weight-supporting portion from that Ko 7 invention (defendant). Bar 10 in the Ko 7 invention (defendant) is one of the members constituting that invention and is inseparable from the weight-supporting portion. Thus bar 10 alone cannot be regarded as the ring-shaped apparatus asserted by the plaintiff. …

[Trial and Appeal Practitioners Study Group 2023] (Mechanical) “Inventive Step of Numerically Limited Inventions” (The Subgroup in Which Takaishi Participated)

Original Ameblo publication: 2024-04-08

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12847567252.html

[Trial and Appeal Practitioners Study Group 2023] Case 1 (Mechanical) “Inventive Step of Numerically Limited Inventions” (The Subgroup in Which Takaishi Participated)

① Where the technical significance of a numerical limitation (its function and effect as means for solving the problem of the claimed invention) is low, inventive step is likely to be denied (as a design matter, etc.).

② Where the technical significance of a numerical limitation is high, the motivation to apply a numerical limitation from a secondary reference to the primary cited invention becomes an issue.

⇒ To establish inventive step, the most important thing is to state in the specification what functions and effects are produced by setting the numerical range of the limitation as means for solving the problem of the claimed invention.

Case 7 (Mechanical) “Inventive Step of Numerically Limited Inventions”

2021 (Gyo-Ke) No. 10091, “Adhesive Tape” case

The differences concerning the four numerical limitations all have low technical significance.

The specification describes general effects of the numerical limitations, but not their mechanisms, and the preferred numerical ranges are broad.

⇒ Design matters; no inventive step

Original Ameblo publication: 2024-04-11

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12847983100.html

[Trial and Appeal Practitioners Study Group 2023] Case 3 (Chemistry 2) “Support Requirement”

No participant objected to the proposition that the basic approach to the support requirement for numerically limited inventions is the same as for inventions other than numerically limited inventions, and that the standard of the Grand Panel (Polarizing Film) applies.

⇒ If the technical meaning can be understood, limited specific examples are sufficient.

[Trial and Appeal Practitioners Study Group 2023] Case 9 (Chemistry 2) “Novelty of Use Inventions”

2021 (Gyo-Ke) No. 10066

The judgment rejected an “unknown attribute” and a “new use” because a person skilled in the art would recognize that the pathological condition, purpose and effect, and operation did not differ from those of the Ko 1 invention.

Another court decision recognizing patentability of a use invention is difficult to distinguish from the public domain.

[Trial and Appeal Practitioners Study Group 2023] (Electrical) Inventive Step of Software-Related Inventions

Original Ameblo publication: 2024-04-14

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12848331171.html

[Trial and Appeal Practitioners Study Group 2023] Case 4 (Electrical)

“Assessment of Inventive Step in Software-Related Inventions, Focusing Particularly on Functionally Expressed Features of Information and Information Processing”

In the software field, warning letters are frequently sent. Even warnings based on abstract claims exert a “deterrent effect,” for example by being flagged in due diligence and causing investment to be abandoned.

[Trial and Appeal Practitioners Study Group 2023] Case 10 (Electrical)

“Treatment of Commercial Practices and the Like in Software-Related Inventions”

2021 (Gyo-Ke) No. 10116

The primary cited invention is in the “gaming” field

⇒ “Commercial practices” in the product-sales and marketing industries cannot be applied without motivation.

⇒ For an invention of a business system, a modification taking cross-industry commercial practices into account is a design matter.

https://www.jpo.go.jp/resources/shingikai/kenkyukai/document/sinposei_kentoukai/2023_houkokusyo_youyaku.pdf

[Trial and Appeal Practitioners Study Group 2023] (Design) “Articles” “Scope of Knowledge and Materials of a Person Skilled in the Art in Determining Ease of Creation”

Original Ameblo publication: 2024-04-15

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12848429963.html

[Trial and Appeal Practitioners Study Group 2023] Case 5 (Design) Identification of the “Article to Which a Design Pertains”

In determining similarity of “articles to which designs pertain,” similarity may be recognized broadly where common uses and functions create a possibility of similarity in form.

The “consumer” in Design Act Article 24(2) is the person whose perspective determines the points of attention and weighting of evaluations concerning the form of the design, rather than the article.

[Trial and Appeal Practitioners Study Group 2023] Case 11 (Design) “Scope of Knowledge and Materials of a Person Skilled in the Art in Determining Ease of Creation”

2021 (Gyo-Ke) No. 10158

It is appropriate to premise the analysis on circumstances in which a person skilled in the art of the article to which the design pertains would “naturally encounter” the material

The part of the holding that transferring a motif is easy where the function is identical can vary with individual circumstances.

https://www.jpo.go.jp/resources/shingikai/kenkyukai/document/sinposei_kentoukai/2023_houkokusyo_youyaku.pdf

[Trial and Appeal Practitioners Study Group 2023] (Trademark) “Trademark Act Article 3(1)(iii): Distinctiveness” “Similarity of Composite Marks”

Original Ameblo publication: 2024-04-17

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12848686359.html

[Trial and Appeal Practitioners Study Group 2023] Case 6 (Trademark) “Trademark Act Article 3(1)(iii): Distinctiveness”

If a mark is generally recognized as describing the quality of services, “including in the future,” it lacks distinctiveness

For example, where the content of goods or services can be imagined from a word or concept used as a particular quality indication in another goods or services field sharing some consumers.

[Trial and Appeal Practitioners Study Group 2023] Case 12 (Trademark) “Similarity of Composite Marks”

Approaches to applying the legal standards of the Supreme Court decisions to individual cases

The general rule is to consider a composite mark as a whole

⇒ There can be various perspectives for determining unity, so it is important to reach a reasoned determination based on a legal standard appropriate to the case

* All the other points merely present opinions of some committee members

https://www.jpo.go.jp/resources/shingikai/kenkyukai/document/sinposei_kentoukai/2023_houkokusyo_youyaku.pdf

IP High Court, 2021 (Gyo-Ke) No. 10033 [Construction Method Using Short Interior Corner Members] <Kanno> Correction of an Error in the Specification Permitted

Original Ameblo publication: 2024-04-19

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12848944205.html

2021 (Gyo-Ke) No. 10033 [Construction Method Using Short Interior Corner Members] <Kanno>

* Correction of an error in the specification was allowed

Before the correction … the two terms “joining” and “connecting” were used for the same stage, so the correction can be said to unify the terminology and constitutes correction of an error.

(Excerpt from the judgment)

(1) Whether the correction constitutes correction of an error …

Before the correction, “joining” was used in claim 1 and paragraph [0022] of the pre-correction specification for the third step, which is the construction stage, whereas paragraph [0025] of that specification stated, with respect to the construction stage, “at this time, the end faces of the first and second short interior corner members 21-1 and 21-2 are connected without cutting … .” Since the two terms “joining” and “connecting” were used for the same stage, the correction can be said to unify the terminology and constitutes correction of an error. …

(2) Whether the correction constitutes clarification of an ambiguous statement …

Before the correction, the work at the same construction stage was described as “joining” in claim 1 and “connecting” in paragraph [0025] of the pre-correction specification, so the correction constitutes clarification of an ambiguous statement.

IP High Court, 2022 (Gyo-Ke) No. 10081 [Golf Club Shaft] <Honda>

Original Ameblo publication: 2024-04-20

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12849120132.html

2022 (Gyo-Ke) No. 10081 [Golf Club Shaft] <Honda>

Torque ($1.6 \leq Tq \leq 4.0$)

Ratio of total bias-layer weight to the combined total weight of the bias and straight layers ($0.5 \leq B / (B + S) \leq 0.8$)

Ratio of small-diameter-side bias-layer weight to total bias-layer weight ($0.05 \leq A / B \leq 0.12$)

Ratio of small-diameter-side bias-layer weight to large-diameter-side bias-layer weight ($1.0 \leq A / C \leq 1.8$)

The court examined separately the upper and lower limits of these four numerical ranges (eight boundary values in total), and held that “a person skilled in the art at the filing date could not have recognized that the problem of the invention could be solved…”.

Tq is the torque of the shaft (°); B is the total weight of the bias layers (g); S is the total weight of the straight layers (g); A is the weight of the small-diameter-side bias layer (g); and C is the weight of the large-diameter-side bias layer (g).

⇒ Support requirement not satisfied

(Excerpt from the judgment)

It is appropriate to find that the problem addressed by the inventions is “to provide a golf club shaft made of fiber-reinforced resin with high torsional rigidity (a low-torque fiber-reinforced resin golf club shaft), which has high swing stability and excellent stability in both flight distance and direction regardless of the player’s swing speed or ability” (hereinafter “the problem”). …

The feature of setting the shaft torque at 4.0° or less cannot be said to fall within a range in which a person skilled in the art at the filing date could recognize, in light of the common general technical knowledge at that time, that the problem could be solved. …

The feature of setting the shaft torque at 1.6° or more cannot be said to fall within a range in which a person skilled in the art at the filing date could recognize, in light of the common general technical knowledge at that time, that the problem could be solved. …

The feature of setting the total weight of the bias layers at 50% or more of the sum of the total weight of the bias layers and the total weight of the straight layers cannot be said to fall within a range in which a person skilled in the art at the filing date could recognize, in light of the common general technical knowledge at that time, that the problem could be solved. …

The feature of setting the total weight of the straight layers at 20% or more of the sum of the total weight of the bias layers and the total weight of the straight layers cannot be said to fall within a range in which a person skilled in the art at the filing date could recognize, from the detailed description of the invention in the specification, that the problem could be solved. …

The feature of setting the weight of the small-diameter-side bias layer at 180% or less of the weight of the large-diameter-side bias layer cannot be said to fall within a range in which a person skilled in the art at the filing date could recognize, from the detailed description of the invention in the specification, that the problem could be solved. …

The feature of setting the weight of the small-diameter-side bias layer at 100% or more of the weight of the large-diameter-side bias layer cannot be said to fall within a range in which a person skilled in the art at the filing date could recognize, from the detailed description of the invention in the specification, that the problem could be solved. …

The feature of setting the weight of the small-diameter-side bias layer at 12% or less of the total weight of the bias layers cannot be said to fall within a range in which a person skilled in the art at the filing date could recognize, from the detailed description of the invention in the specification, that the problem could be solved. …

The feature of setting the weight of the small-diameter-side bias layer at 5% or more of the total weight of the bias layers cannot be said to fall within a range in which a person skilled in the art at the filing date could recognize, from the detailed description of the invention in the specification, that the problem could be solved.

IP High Court, 2022 (Gyo-Ke) No. 10112 [Control System for Fee-Charging Automatic Machines] <Honda>

Original Ameblo publication: 2024-04-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12849321194.html

2022 (Gyo-Ke) No. 10112 [Control System for Fee-Charging Automatic Machines] <Honda>

"Since the problem can be solved provided that … is possible, individual factors such as the types of input signals and the determination method, which are details of the means for solving the problem …, were encompassed by that configuration in the original specification, etc. …"

⇒ No addition of new matter

(Excerpt from the judgment)

… Like Invention 1 before the amendment, amended Invention 1 can solve the problem provided that a device having an IC card reader/writer unit and a communications unit can "output information indicating whether or not [the machine] is operating" to a management server, irrespective of the types of input signals or the specific method for determining "operating" or "not operating." Thus individual factors such as the types of input signals and the determination method, which are details of the "monitor and transmit" and "output information" configurations constituting the means for solving the problem, can be said to have been encompassed by those configurations in the original specification, etc. Even if amended Invention 1 comes to include types of input signals or determination methods not exemplified in the original specification, etc., this does not add a new technical matter to the technical matters derived from the original specification, etc. as a whole.

IP High Court, 2018 (Gyo-Ke) No. 10100 [Transdermal Absorption Preparation] <Tsuruoka> * Correction of Errors in the Detailed Description Allowed

Original Ameblo publication: 2024-04-22

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12849321437.html

2018 (Gyo-Ke) No. 10100 [Transdermal Absorption Preparation] <Tsuruoka>

* Correction of errors in the detailed description of the invention was allowed. (Slightly more lenient than for claim language?)

There is no evidence sufficient to establish that “hinai” and “hifunai” are medical terms with different concepts … and it is inconceivable that “hinai” was used in the corrected passage to express such a different concept.

(Excerpt from the judgment)

Correction 12 changes “hinai” to “hifunai” in paragraph [0003] of the specification. It is clear from the context that the passage explains, as background art, inserting microneedles, particularly self-dissolving microneedles, into the “skin” (“hifu”). Considering also that all other occurrences in paragraph [0003] use the term “hifu,” it is appropriate to understand “hinai,” the term corrected, as having omitted the character “fu” from “hifu” and as properly having been intended to read “hifunai” (“within the skin”). Accordingly, Correction 12 satisfies the requirements for correction as correction of an error. In response, the plaintiff argues that “hinai” is a medical term expressing a concept different from “hifunai” and that “hinai,” expressing that different concept, was also used in the corrected passage. However, there is no evidence sufficient to establish that “hinai” and “hifunai” are medical terms with different concepts. At least in the corrected passage of paragraph [0003], it is inconceivable that “hinai” was used to express such a different concept, as already explained. Accordingly, the trial decision allowing Correction 12 is appropriate in its conclusion and should be held lawful. …

Correction 16 changes “the surface and dermis of the skin” to “the epidermis and dermis of the skin” in paragraph [0077] of the specification. That passage explains the solubility of the target substance in the skin in relation to surfactants used as absorption enhancers. The invention is, in the first place, a transdermal absorption preparation having a base and a target substance, used by insertion into skin consisting of epidermis and dermis. It is therefore clear that the solubility of the target substance is relevant in “the epidermis and dermis of the skin,” not “the surface and dermis of the skin.” Taking into account also that paragraph [0030], which should be regarded as corresponding to paragraph [0077], uses the term “the epidermis or dermis of the skin” …, it is appropriate to understand “surface,” the term corrected, as having been written in error where “epidermis” should have been written. Accordingly, Correction 16 satisfies the requirements for correction as correction of an error.

Osaka District Court, 2017 (Wa) No. 1390 [Lamp] * Prior Use Right Recognized for a Numerically Limited Invention

Original Ameblo publication: 2024-04-24

Ameblo: https://ameblo.jp/hideki-takaishi/entry-12849582464.html

Osaka District Court, 2017 (Wa) No. 1390 [Lamp] * Prior Use Right Recognized for a Numerically Limited Invention

No change over time.

The 403W invention has y = 15.7 mm and x = 11.7 mm, and thus the configuration y = 1.34x.

⇒ While maintaining its function, it is possible to modify the design to a numerical range satisfying the relationship between x and y specified by the inventions.
